To begin, then, with Mexico's liabilities, the first thing to consider is the amount and burdensome nature of her foreign indebtedness. Fortunately, as has been said, we are delivered from the necessity of going into the maze of Mexico's numerous and complicated foreign loans prior to June, 1885, since on the 22d of that month a comprehensive law was passed consolidating all of Mexico's foreign debt into a new issue of bonds. This measure was certainly statesmanlike in its intention, at least, and was as little a repudiating scheme as could have been expected. The foreign bondholders, at any rate, submitted to its provisions with a good grace, and have probably been less anxious at the scaling down of the face value of their old bonds than over the question whether their new ones will prove to be a safe investment. According to the terms of the law referred to, the new bonds are to bear interest at 3 per cent., beginning with January, 1890. For 1886 the rate was fixed at 1 per cent., to be increased by the addition of ½ per cent. annually, until the 3 per cent. rate should be reached. The emission was to the amount of $150,000,000, of which, up to June, 1887, something more than $100,000,000 had been received by foreign creditors in lieu of their old bonds. In addition to this "consolidated debt," as it is called, there is a floating debt, secured by Treasury notes and Custom-house certificates, amounting to about $50,000,000. The last Congress authorized an additional loan of $62,500,000, about one-third of which, it is reported, has been negotiated at 8 per cent. There will result, therefore, a total funded debt of about $250,000,000, involving an annual interest charge of something like $12,000,000. For the year ending in July, 1886, the Treasury accounts show payments on the score of the public debt of $2,556,992. That, as we have shown, was when but a part of the consolidated debt was drawing interest, and that at a reduced rate, and when the new loan, involving an annual charge of at least $5,000,000, was not yet authorized. As has been said, then, Mexico's debts will represent after 1890 a tax on the nation of about $12,000,000 yearly.

Turning now to the question of regular Governmental expenditures, we are confronted with a singular difference between the way the Mexican Congress deals with the estimates submitted by heads of departments and the habit of our own House of Representatives in similar circumstances. In Mexico the Government always gets what it asks for, and usually a little more. For example,

in 1885-6 it asked for $38,903,353, got $42,458,323, and spent but $31,672,836. That was the year of notable and forced economy, when public salaries were scaled down and every possible retrenchment was practised, so as to avert the threatening national bankruptcy. For 1886-7 the estimates called for over $37,000,000, and were voted accordingly. For 1887-8 they are $36,270,451. On the whole, taking the average of the last three or four years, and leaving out of the Treasury estimates the amounts needed for payment on the public debt, it seems doubtful if the necessary Governmental expenditures can be screwed down below $30,000,000 yearly. They were slightly over $29,000,000 in 1885-6, and the severe economy of that year is not likely to be repeated soon.

The Government is organized in nine departments, whose names and respective expenditures may be seen in the following table of estimates for 1887-88:

Legislative	$1,002,928
Executive	49,846
Judicial	439,994
Foreign relations	434,930
Gobernacion	3,466,882
Justice	1,399,850
Public Works	4,426,132
Treasury	11,664,391
War	13,386,495
	$36,271,448

Gobernacion includes the administering of public schools, the Post-office, police and militia, etc. The Treasury estimates embrace, of course, interest on the public debt. "Justice" includes the subordinate tribunals and the national technical and professional schools.

The receipts of the Federal Treasury during the five years ending in July, 1886, averaged $31,416,000. In 1883-84 they reached the sum of $37,620,000, undoubtedly the largest in the history of the country. For 1885-86 they were $27,810,909. This income arises from customs duties and internal taxation. The latter is a systematized levying on everything in sight, and appears to have produced about one-quarter of the total revenue in 1885-6. The principal items are: Stamps, $6,103,413; direct taxes (on sales, professions, real estate in the Federal District, etc.), $1,038,074; sales of church property, $220,618; lotteries, $273,074. The remainder of the national revenue is derived from the Post-office and Government Telegraph, from the sale of public lands, and the lease of railroads and other Government property, together with the receipts from customs duties. No clear idea can be obtained from the Treasury reports of the exact amount of the last item. But the total receipts are stated clearly enough, and are clearly enough considerably below the total expenditures. In fact, the budget has steadily shown a deficit for the past five years averaging $5,000,000, except in 1884-5, when it was over $15,000,000. It was unquestionably this repeated running behind that caused the last public loan.

As we have already made clear, the requirements of the Treasury will be heavier as the interest charge on the national debt goes on increasing. What is the prospect that the receipts will be augmented in an equal or greater proportion, as they will have to be, to prevent ultimate bankruptcy? Very poor, it seems to us. Certainly, there appears to be no possibility of extending the system of internal taxation. It had even to be slightly curtailed in the last fiscal year reported, and the revenue from it fell off more than $300,000. The only real hope of an increased income is in larger returns from the duties on foreign commerce. In point of exports, Mexico's foreign trade has shown a considerable growth in the last five years. Exports have increased from $29,928,697 in '80-81 to $43,647,717 in '85-86. Still, the increase has been almost wholly in the one item of precious metals. And, with the practical removal of all export duties, this means nothing for the income of the Government, whatever it may denote as to the general prosperity of the country.

No full and trustworthy statistics of imports are accessible, but it is undoubted that they have fallen off. We know, for example, that England's exports to Mexico fell from $9,513,522 in 1882 to $4,212,162 in 1885, and that the United States exported to Mexico in the same years goods to the value of $13,320,000 and $7,370,000 respectively. It would thus appear that the impetus given to Mexican trade by the opening of the American railroads was not as lasting as was hoped. Something may be expected from the general commercial rally just now prevalent, and possibly from the working of the new tariff, not yet a year in force. But there seems to be no likelihood that Mexico will find in her custom houses material to bridge over the gap between her income and expenses. Retrenchment is scarcely possible, unless in the enormously disproportionate cost of the army. The Government may get up courage to try that, though only as a dire necessity. We sincerely hope that we are wrong in our conclusions, for we sympathize with the rulers of Mexico in their efforts to make head against her immense financial difficulties; but we cannot help anticipating a repetition of the old story of deferred and unpaid interest, then of repudiated (under the name of readjusted) debts.

THE DUPONTS AND THE DURANDS.

THERE is a very amusing story in a recent number of the Paris *Temps* illustrative of what it calls the "Americanization of our Manners." The particular "Americanization" to which it refers is the practice, which it alleges to be growing in Paris, of inviting to evening parties people with whom the host and hostess have no personal acquaintance. The writer evidently believes that American parties are at least partly made up of "entire strangers," and that it is the custom here for those who give balls or dances to send invitations to any one whom they would like to have, or whom they would like to be thought to have had, or of whom they have heard as frequenting other people's soirées. He intimates that it has gone so far, indeed, that at American parties watches and trinkets are as unsafe as they would be at a horse-race or a fire; that prudent people leave them at home when going to such entertainments; and that in Paris their example begins to be followed.

The story he tells in illustration of this is that of a certain M. Dupont and M. Durand, who had apartments in the same house in Paris, but who were bound by their leases not to give evening parties of any description, the proprietor, who lived in the building, having a strong objection thereto. Wishing very much, however, to have dances in their rooms, they demanded his permission and got it, on condition that they would both give their parties the same evening, so that he might not lose more than one night's rest. He then instructed his concierge that when the evening came he was to watch at the entrance and send Dupont's guests to Durand's apartment, and Durand's, in like manner, to Dupont's apartment, which he did. But, as the proprietor anticipated, it made, for a while, no difference to either guests or hosts. As none of the guests knew either Dupont or Durand, and as Dupont and Durand knew none of the guests, the fraud of the concierge was not discovered, and all went merry as a marriage-bell. At last, however, an acquaintance of Dupont did arrive, and, finding himself in Durand's apartment, gave the alarm; a panic spread among the guests, and they made a rush for Dupont's apartment. Their appearance revealed the truth to Durand's guests already there, and they in their turn made a rush for Dupont's apartment. The opposing currents met on the staircase, and the block was so alarming that the concierge, who was in tears of laughter, became alarmed, and sent for the policeman who was keeping order among the carriages in the street. He was an old soldier and a man of decision, and he promptly restored order by calling on all the Duponts to file to the right, and all the Durands to the left, and, when the ranks were properly formed, shouted, "En avant! Circulez!" and all went well, and each host soon had his own guests. But the confusion and nervous prostration in which they found him on their arrival can be readily imagined. The horrible truth had slipped out that his company were unknown to him, that he had filled his rooms with strangers, and had apparently no personal friends of his own whom he cared to see when he gave a fête.

The story is told as an actual occurrence, though doubtless somewhat embellished in the telling. But have similar things happened in this city of New York under like conditions, or might they have happened? Have we Duponts and Durands "in our midst," who appeal to that love of being in a crowd in a well-furnished house, where there is good eating and drinking going on, by which so many of us are animated, without caring particularly how we get there, who our companions are, or who invites us? Between people who accept invitations from rich strangers, and people who like to go to the houses of rich strangers whether they are invited or not, the line of demarcation is very faint, and the consequence is that the two classes are very apt to meet at balls and par-

ties in greater or less numbers. There was a large reception in this city recently at which both were present in great force, and got tipsy together, and jostled the ladies in the dressing-rooms, and stole their wraps, and very nearly turned the fête into a scene of vulgar riot and debauch. But are such things common or even frequent?

Of course such customs are ruinous to anything that can be called manners. When the relation of host and guest is reduced simply to the offer and acceptance of a heavy meal on a certain evening, there can be neither authority on one side nor respect on the other. The house is simply a hotel, in which there is nothing to pay and the landlord is not responsible for valuables. On what costs men nothing, even the best men put little value. Dinners and suppers under one's own roof should stand for something more than a treat in a bar-room usually does, in order to put a guest under a sense of obligation. They should indicate at least previous and favorable knowledge of the guest, however slight or indirect, on the part of the host, some respect for his character, and some confidence that he has better reasons for behaving properly in a man's house than the fear of being kicked out. Hospitality which has no better motive than showing off to as large a crowd as possible how much money one has got, can hardly be called civilized intercourse at all. It is not much better than the show of wives which the King of the Niam-Niams made to Schweinfurth, the traveller. It has none of the moral foundation which all civilized communities now try to give to their social usages.

No city has probably done as much to swell the ranks of the Duponts and Durands as Washington, owing to the almost complete merger which has there taken place between public and private life. The practice of treating every man in office as the personal acquaintance of everybody who lives in the city, or can raise money enough to get there from any other part of the country, and obliging him to open his house to everybody who walks the streets, has brought attempts at privacy into more or less disrepute, and given everybody a sort of "natural right" to the hospitality of everybody who entertains at all. What makes this all the odder is, that there is no city in which there is so much talk about "etiquette," and so little etiquette which is of the slightest value as a regulalator of social intercourse. Discussions about etiquette and decisions of knotty points of etiquette, in fact, if one might judge from the letters of newspaper correspondents, occupy a large part of the time of all those who are not seriously occupied with politics; but in no capital in the world has etiquette so little power, or is knowledge of it of so little use. In fact, if Washington customs were to spread to New York, the simplest hospitality would rapidly go the way of "New Year's calls."

AMOS BRONSON ALCOTT.

It is often noticed, when the tie between two life-long associates is broken by the death of one of them, that the other shows the effect of the shock from that moment, as if left only half alive—*nec superstes integer*. So close was the intercourse, for many years, between Mr. Alcott and Mr. Emerson—so perfect their mutual love and reverence—so constant their co-operation in the kind of work they did and the influence they exerted—that it was difficult to conceive of Mr. Alcott as living long alone; and it seemed eminently appropriate that part of the remaining interval of his life should be employed in writing his friend's memoir. They were singularly different in temperament, and yet singularly united. They were alike in simplicity and integrity of nature, as well as in their chosen place of residence and in the elevated influence they exercised. In all other respects they were unlike. Mr. Alcott was conspicuously an instance of what may be called the self-made man in literature. Without early advantages, and with no family traditions of culture, he took his place among the most refined though not among the most powerful exponents of the ideal attitude; whereas Mr. Emerson came of what Dr. Holmes called Brahmin blood, had behind him a line of educated clergymen, and had received the best that could be given in the way of training by the New England of his youth. Their temperaments were in many ways different: Emerson was shy and reserved, Alcott was effusive and cordial; Emerson repressed personal adulation, Alcott expanded under it; Emerson found in literature his natural function, Alcott came to it with such difficulty that Lowell wrote of him,

> "In this, as in all things, a lamb among men,
> He goes to sure death when he goes to his pen."

Emerson's style was enriched by varied knowledge, his use of which made one always wish for more. Alcott's reading lay only in one or two directions, and his use of it was sometimes fatiguing. Emerson's most serious poems were prolonged lyrics; Alcott could put no lyric line into his grave and sometimes weighty sonnets. Emerson was thrifty, and a good steward of his own affairs; Alcott always seemed in a stately way penniless, until the successful career of his daughter gave him ampler means. Emerson gave lectures with an air of such gracious humility that every hearer seemed to do part of the thinking; Alcott called his lectures "conversations," and then was made obviously unhappy if his monologue was seriously disturbed by any one else. Emerson's most startling early paradoxes were given with such dignity that those hearers most hilariously disposed were subdued to gravity; Alcott's most thoughtful sentences, at the same period, came with such a flavor of needless whimsicality as to make even the faithful smile.

Yet there was between them a tie as incapable of severance as that which united the Siamese twins. Mr. Emerson found in the once famous Chardon-Street and Bible Conventions no result so interesting as the "gradual but sure ascendancy" of Mr. Alcott's spirit—"in spite," wrote this plain-spoken friend, "of the incredulity and derision with which he is at first received, and in spite, we might add, of his own failures." Mr. Alcott, as has been said, devoted his last years to the delineation of Emerson as the greatest of men. Yet so sincere was this mutual admiration, so noble this love, that it is impossible to speak of it with anything but reverence; and the far wider fame and influence of Emerson made it for Alcott, during his whole life, an immense advantage to have the unfailing support of a friend so eminent.

For it must be remembered that during many years the public was scarcely in the habit of taking Mr. Alcott seriously. It received him, as Emerson said, "with incredulity and derision." His antecedents seemed a little questionable, to begin with. Born in Wolcott, Conn., November 29, 1799, and occupied for many years in the humble vocation of a travelling salesman in Virginia—not to say peddler—he came, in 1828, before the somewhat narrow intellectual circles of Boston in a wholly different light from Emerson, who had every advantage of local prestige. His school, which became celebrated through the 'Record of a School,' by his friend and assistant, Miss Elizabeth P. Peabody (Boston, 1835; 2d ed., 1836), was generally regarded as coming near the edge of absurdity, because of the rather obtrusive reverence paid in it to the off-hand remarks of children six years old, and because of the singular theory of vicarious punishment which sometimes led to the giving of physical pain to teacher instead of pupil. Yet this school undoubtedly anticipated in some respects the views of teaching now recognized; it won the warm approval of James Pierrepont Greaves, the pupil and English interpreter of Pestalozzi; and it led to the establishment of an "Alcott House School" at Ham (Surrey), in England, by Henry G. Wright, afterwards Mr. Alcott's co-laborer in another direction. Mr. Alcott himself visited this school in 1842, and was lionized to his heart's content—which is saying a good deal—among English reformers. Some account of this visit and of the English enterprise will be found in a paper by Mr. Emerson in the *Dial* for October, 1842. Mr. Alcott's first conspicuous social movement was in the very vague direction of the Fruitlands Community, at Harvard, Mass., a scheme which was as much wilder than Brook Farm as Brook Farm was than Stewart's dry-goods shop, and which was amusingly delineated by Miss Louisa Alcott in one of her minor sketches. His first intellectual demonstrations were in the "Orphic Sayings" of the *Dial*, which were regarded at the time as the *reductio ad absurdum* of Transcendentalism. How were people to take a man seriously who wrote, "The popular genesis is historical," and "Love globes, wisdom orbs everything"? These sentences now seem quite harmless, though perhaps a little enigmatical; but they were then held to be the worst shibboleth of that new bugbear, Transcendentalism, and they represented the most unpopular aspect of the *Dial*, while the more plain-spoken essays of Theodore Parker were what sold the numbers, so far as they ever did sell. Then, what Mr. Alcott called conversations, in his earlier days, were such startling improvisations, so full of seemingly studied whim and utter paradox, that those who went to learn remained to smile. There was plenty of thought in them, and much out-of-the-way literary knowledge; but, after all, the theories of race, food, genesis, and what not, left but little impression on the public mind. It awakened some surprise when the first volume of 'Appletons' Cyclopædia' (in 1857) contained a sketch of Alcott, written by Emerson. Thenceforward his claim to recognition stood on a basis a little firmer; but he had up to this time paid the price which a hopelessly ideal temperament must pay before it has established its right to live.

It was fortunate for Mr. Alcott that with this ideal tendency he combined in a high degree the qualities of moral and physical courage which have in all ages been held essential to the true sage. This was hardly tested in the milder and safer reforms, in which he took a certain enjoyment, partly founded on the prominence they gave him. He was unquestionably one of those who like to sit upon a

platform, to be pointed out, *digito monstrari*, and he may have liked to feel that his venerable aspect had the effect of a benediction. But he was equally true to the anti-slavery movement, when that meant the sacrifice of friends, the diminution of his always scanty finances, and even the physical danger involved in mobs. Once at least, in a very conspicuous instance, he proved himself personally brave when many others proved cowards. On the night of the attempted rescue of the fugitive Anthony Burns, in Boston (May 26, 1854), after the door of the United States Court-house, where the slave was imprisoned, had been burst in, the few abolitionists who got inside were met by a much larger body of the Marshal's men, and were forced out again, after one of the deputy marshals had been killed. The crowd outside was amply sufficient to have made its way in and rescued the slave from the United States Marshal, who had but about thirty men and was taken wholly unprepared, as he afterwards admitted; but, unhappily for the assailants, owing to a miscarriage of the notice given at Faneuil Hall, the crowd itself was composed mostly of lookers-on, and not of men who meant business. The invaders being ejected, the Court-house steps were left empty, the crowd forming a semicircle below; while the Marshal's men fell back to the stairway, over which their pistols could be seen pointing into the empty and lighted hall which had just been the scene of conflict. It was a picturesque situation—a moment of truce; everybody waiting to see what would happen next. The next thing that happened was the calm advance from among the crowd of the dignified form of Mr. Alcott, who had just arrived on the scene. Ascending the first step, he paused, and said to one of the ejected assailants—as placidly as if in one of his own "conversations"—"Why are we not within?" The person addressed replied with some indignation, "Because these people will not stand by us." Mr. Alcott returned no answer, but, grasping his cane, ascended the steps, entirely alone, and stood for a moment a conspicuous figure, at the brightly-lighted doorway. A pistol-shot was fired from within, presumably at him, upon which the philosopher, looking quietly round and seeing that he had no followers, and that it would have been throwing away his life to proceed, turned and walked down the steps, with the same measured gait and without the slightest precipitancy of manner, reëntering the crowd which opened to receive him. This anecdote has not before appeared in print, so far as we know, but we have it from a participant in the affair, who declares that under the circumstances neither Socrates nor Plato could have behaved more handsomely.

It is probably true that in the later years of his life Mr. Alcott felt some reaction from the theological radicalism which at one time marked him, and which made him in this direction a source of influence over others. At the first annual meeting of the Free Religious Association in 1868, he reaffirmed his old attitude of the simple humanity of Jesus Christ, and of the essential identity of all forms of the religious sentiment. He said of this position:

> "So fine, so sublime a religion as ours, older than Christ, old as the Godhead, old as the soul, eternal as the heavens, solid as the rock, *is and only is;* nothing else is but that, and it is in us and is us; and nothing is our real selves but that in the breast."

And so identified was he with the whole spirit of that meeting that he said of it, "I have seen many charmed days, and shared sublime hopes; but this, of all days I have yet seen, is the most sublime." But during the later years of his life, though he took part in the very last meeting of the same Association, he seemed to revert more towards the historical Christianity in which his childhood was reared; although it is claimed by some of his intimate friends that his position was not essentially altered from what it was when he was held among the chiefs of liberalism. At any rate, the apparent change led to his taking an active part in various "symposia" held by Mr. Joseph Cook, at which the veteran free-thinker was received with many blandishments, and was introduced to strangers without compunction as "Mr. Alcott, the American Plato."

Mr. Alcott's published volumes were as follows: 'Conversations with Children on the Gospels, conducted and edited by A. B. Alcott,' 2 vols. (Boston: Munroe, 1836-7); 'Spiritual Culture, or Thoughts for the Consideration of Parents and Teachers' (Boston: Dowe, 1841 [this was anonymous, but was attributed to Mr. Alcott by Charles Lane in *Dial* iii, 417]); 'Tablets,' (Boston: Roberts, 1868); 'Concord Days' (Boston: Roberts, 1872); 'Sonnets and Canzonets' (Boston: Roberts, 1882). To these must be added a preliminary sketch of Emerson, printed but not published, and also many contributions to the *Dial* (1840–44), the *Radical*, and other magazines. In the *Atlantic Monthly* (ix, 443) he wrote one of the best sketches yet made of Thoreau, under the title "The Forester." But he was less disposed to pride himself upon his books than upon his chosen mode of influence, the conversation; and it was through this, rather than by anything placed in the permanent record of print, that his influence was exerted. He wrote in the *Dial*, in 1842, "We must come to the simplest intercourse—to Conversation and the Epistle. These are most potent agencies—the reformers of the world" (ii, 431). And he might well feel it a tribute to his real power in this chosen form of propagandism, that, after his audiences in the Eastern States had grown less numerous and less attentive, he should have found a wide circle scattered through different Western cities, who opened parlors and pulpits to him for an annual tour of conversation and discourse, sending him back each year happy, refreshed, and—wonder of all wonders!—with money in his purse.

Mr. Alcott contributed even less than Emerson to anything that can be called systematic thought; he was indeed more remote than Emerson from anything to be called a system. Yet the good that he did was not merely fragmentary and sporadic; it might rather be called, using one of his own high-sounding adjectives, atmospheric; it lay in the atmosphere of the man, his benign face, his pure life, his only too willing acceptance of everything that looked like original thought in others. More than all, it lay in the persistent moral activity that could outlive what Emerson called his "failure," could outgrow the censure of his critics, outgrow even his earlier self. In some respects he always remained the same, even to his weaknesses; there was always a certain air of high-souled attitudinizing; he still seemed at times what some one long since called him, "an innocent charlatan." Even his latest achievement, the "Concord Summer School of Philosophy," had always an indefinable air of posing for something that it was not. It undoubtedly fulfilled Mr. Alcott's most delicious visions to find himself the centre of an admiring group of young disciples, having the Assabet River for an Ilissus and the Concord elms for the historic plane-trees; but, after all, the institution, like its name, was a little incongruous; there was plenty of summer, something of philosophy, and very little school. Probably most of those who were assembled came with the desire to place themselves in contact with Mr. Alcott; and this was the highest compliment they could pay him. They instinctively felt, as all may well feel, that the essential fidelity of the man to great abstract principles made him a living exponent, not merely of the temporary school of Transcendentalism, but of the whole ideal attitude. Now that he has passed away, all his little vanities, if he had them—all his oracular way of peering into the dark and winning but little out of it—these defects, if they were defects, disappear in the sweetness and dignity of a life so prolonged and so honorable. There lives no man who ever found in Mr. Alcott an enemy; there exists no man who ever went to him for counsel and found him unsympathetic or impatient; while there are many men who, at the forming period of their intellectual existence, have derived from him a life-long impetus towards noble aims.

BULGARIA.—II.

HEIDELBERG, February 9, 1888.

THE assassination of the well-intentioned Emperor Alexander II. forms an important epoch in Bulgarian history. The Prince lost his kind and faithful protector, Bulgaria a well-wisher, and when Prince Alexander travelled to St. Petersburg to be present at his uncle's funeral, he became exposed to a number of subtle and dangerous influences. The Ring, having lost its confidence of spoiling the Bulgarians with the consent of their present representatives, did their best to bring about a change in the Constitution. They knew that, thanks to the venality of the Opposition leaders and to the unreasonableness of their followers, the Prince well-nigh despaired of furthering the development of his country through the existing ultra-democratic institutions. They hoped to get him into their hands, if he established his authority more firmly, and they set to work upon him and Alexander III., and the Russian Government in order to encourage the idea of suspending the Bulgarian Constitution. And as soon as the Prince had obtained from his people (July 13, 1881) full powers for organizing the country, we see the railway concession coming up again for discussion.

This time the Ring had summoned a formidable array of allies. Besides the Minister of Public Instruction, a native of Bohemia, only two Bulgarian Ministers attended the meeting of the Cabinet on July 30, 1881, whereas Russia was represented by M. Hitrovo, by Lieut.-Col. Remlingen (at the head of the Home Office and the Board of Public Works), by M. Kopitkin, and by a Gen. Struve, who had just arrived from St. Petersburg and gave himself out as being charged by the Imperial Government to claim the right of constructing a line from Rustchuk to Sofia. Struve suggested that the amount to be spent in preparatory labors should be left to him, but Messrs. Vulkovitch and Zhelaskovitch insisted upon fixing the amount at 300,000 francs, and maintained that the concession, subject to the consent of the Chamber, should be ultimately bestowed by public competition. If Gen. Struve should not obtain it, the 300,000 francs were to be refunded to him either by the contractor or by Government. Col. Remlingen was charged officially to notify Gen. Struve of this decision. But what did M. Remlingen do? He wrote to the General that the Government accorded him the exclusive privilege of studying the line, having his expenses paid, and submitting pro-

posals for the construction of the railway. This shameful manœuvre was brought to light and frustrated, and when Col. Remlingen tried to prevent a Frenchman, Guyon, and a Bulgarian of the name of Adyenot from studying the line, the Prince interfered.

At this period the Prince and his Bulgarian Ministers began to doubt Gen. Struve's assertions as to the importance attached by the Russian Government to the construction of a "strategical" line. They finally prevailed upon M. Hitrovo to go to St. Petersburg and obtain from his Government either an advance of funds or the guarantee of a loan destined to the construction of the line. The Russian Cabinet met for the purpose, and refused both requests. At the same time Prince Alexander received permission from the Emperor to discharge Col. Remlingen, and to confer his post on one of the most able and trustworthy Bulgarians, on M. Natchevitch.

The Ring was driven to change tactics. M. Hitrovo leagued himself with the Extreme Left, whose press was showering abuse on the Prince. He organized armed bands and sent them across the Bosnian frontier to provoke an insurrection. Austria expressed its dissatisfaction in very clear terms, and the Prince felt exasperated at having to bear the responsibility for such a breach of international law. Not satisfied with this, M. Hitrovo tried to provoke a military pronunciamiento against the Prince. He issued a proclamation to all Russians serving in the Bulgarian army, notifying them that, he being the Emperor's sole representative, they need not obey any orders except those proceeding from him. The notice fell flat, as the Prince was popular among the officers, and the Russian Government found itself in honor bound to recall its Consul-General Hitrovo, and the Minister of War, Kryloff. To be sure, Prince Alexander had been obliged to proceed to Russia himself (April 27, 1882) in order to obtain their recall, and he was obliged now to accept Gen. Alexander Kaulbars as War Minister, and Gen. Soboleff as Minister of the Interior. The latter, a member of the Ring, was indefatigable in his efforts to obtain a railway concession for his friends, and both the new ministers flagrantly transgressed the instructions which Emperor Alexander III. had given them in his cousin's presence. He had told them to support the Prince with all their might in his efforts to reorganize Bulgaria, and he had ordered them to make common cause with the so-called Conservative party, which ought more justly to be denominated the Moderate Liberal party.

The two generals adopted a haughty and overbearing tone towards the Prince and his advisers; they allied themselves with the Opposition, and as soon as they discovered that their Bulgarian colleagues Natchevitch, Vulkovitch, and Greshoff were determined not to sacrifice their country's interests to a foreign ring, they founded a newspaper, the *Balkan*, out of Government funds, for the purpose of injuring and calumniating the Ministry. The Russian paper, *Novoye Vremya*, zealously joined in this abuse; and as soon as voices were raised in the Russian press in favor of Bulgaria, the official censors stepped in and silenced the Ring's adversaries. The two generals had within a short time acquired the epithet, *zhelezno-dorozhnie, i. e.*, "railroaders," so sharp was the insight of the people into the leading motives of their new ministers' policy. An honest man, M. Arsenieff, happening to be in charge of the diplomatic agency at Sofia, the generals annoyed him to such a degree that he did not rest till he was transferred to Berlin. Naturally, it never suited these intriguers that truthful reports on Bulgarian events should reach Baron Giers and his master.

The Sobranye which met on December 22, 1882, and in which the Conservatives had a majority, showed fight. It decided not to discuss the railway question until the Department of Public Works had been transferred from Gen. Soboleff to a Bulgarian. When M. Natchevitch had been charged with this post, the Assembly granted 300,000 francs for tracing the line, but only on condition of a public competition for the concession. The Russians did not accept their defeat; they were wily enough to conjure up an episode—a quarrel between the Synod and the Archbishop of Sofia—which led to the resignation of their Bulgarian colleagues. The Prince unhappily agreed to their leaving office, as he did not feel equal to an open rupture with Russia, which was inevitable if the two generals had been requested to give way. On taking leave, the three Ministers handed a memorandum to the Prince, in which the situation was clearly described and the future foretold. They pointed out that if he allowed the Russian generals to have their way, the patience of the country would be soon exhausted, and that if he opposed them, Russia would throw him overboard. It must be supposed that Prince Alexander was not unaware of this dangerous dilemma, but that, owing to the new Emperor's promise to continue his father's policy towards him and Bulgaria, he relied on setting matters straight at Moscow, where he was to assist at the coronation. It was merely a question how to tide over the period from February to May, and he saw no other way than by letting the Russians do as they pleased. He did make one attempt, to be sure, to denounce the two generals to the Czar and his Minister of Foreign Affairs, by despatching M. Stoiloff to St. Petersburg as diplomatic agent. But the Ring took care to keep all the doors closed at which M. Stoiloff knocked, and he had finally to return home without having seen either the Czar or M. de Giers.

While the Prince was travelling to Moscow via Constantinople and Darmstadt, the Bulgarian Assembly despatched its President and five members to St. Petersburg to lay the people's grievances before the Czar. The Ring was equal to the occasion. Soboleff himself was made to start from Sofia with a counter-deputation, and, the Czar refusing to receive Archbishop Simeon except in Soboleff's presence, the opportunity for confidential disclosures was lost. At last the Prince found himself in the Emperor's presence, and his earnest representations and solicitation produced an impression both on the Czar and on M. de Giers. He was promised the recall of Soboleff and Kaulbars, and the return to Sofia of Gen. Ernroth, who had earned such an excellent reputation there, and who told M. de Giers openly that he was opposed to all ideas of Russian railway enterprises in Bulgaria. Hardly, however, had the Prince turned his back on Russia, than he was officially informed of Ernroth's appointment being cancelled, and of M. Yonin's being appointed Consul-General at Sofia. He hurried home and arrived just in time to prevent the execution of Soboleff's latest design. The Ring had settled with the banker, Günzburg, that he should advance a loan of 75,000,000 francs for Bulgarian railways. To guarantee the interest on this loan, the cash in the Bulgarian exchequer, amounting to 15,000,000 francs, was to be despatched to St. Petersburg and deposited there. Though the Prince arrived in time to frustrate this plan, he was too late to prevent M. Barmoff from concluding an arrangement by which funds were procured for the future revolt. The principality owed Russia 26,000,000 francs for the military occupation during and after the war. The Czar generously decided that this money should not be transmitted to Russia, but should be exclusively spent for the good of Bulgaria. Sobeleff, however, signed an arrangement with the unprincipled Director of the Bulgarian Financial Department, to the effect that, in payment of the indemnity, a yearly sum of 1,600,000 francs should be placed at the disposal of the Russian Consulate-General. From this fund, according to our author, 1,500,000 francs were taken for the purpose of corrupting the officers, soldiers, and cadets, who kidnapped the Prince on August 21, 1886. There is a discrepancy between this statement, made on the authority of Major Gruyeff, the chief conspirator, and the pretty well-authenticated declaration of the Russian Ambassador in Turkey, that they had rid themselves of Prince Alexander at the cost of 300,000 francs. But it is easy to reconcile both statements, if we suppose 1,500,000 francs to have been withdrawn from the fund by M. Bogdanoff, the acting Agent, and by Col. Sakharoff, the military attaché, of which sum 300,000 francs were divided among the Bulgarians, while the rest was kept by the Russian conspirators.

It may be imagined that, flushed with this triumph over the Prince and the Bulgarians, the insolence of the two generals became insupportable. At M. Yonin's instigation, Gen. A. Kaulbars assembled the Russian officers in the beginning of September, 1883, at the camp of Kniazhevo, and told them that the Prince was Russia's enemy; that he had resolved to replace the Russian officers with Germans. Consequently, it became necessary that he should be deposed. To the General's surprise, he met with little response; the majority of the officers declared that, the Czar having ordered them to swear an oath of fidelity to Prince Alexander, he alone could discharge them from their obligation. They hastened to inform the Prince of Kaulbars's treachery; he showed himself at the camp, and, after an enthusiastic reception, was escorted home by the whole body of troops, 10,000 men, under command of their non-commissioned officers. Emboldened by this loyal demonstration, the Prince upbraided the generals, and, receiving an insolent answer, he bade them leave the palace, and told them that they had ceased to be his Ministers. The next day M. Yonin called and informed the Prince that, according to orders just received from St. Petersburg, the generals would remain and retain office. In this exasperating state of things, the Conservatives formed the plan of gaining over the Opposition by offering to make a coalition Ministry, and to accept the reëstablishment of the Tirnovo Constitution as a common programme. The Prince signified his approval, and when the new Assembly was opened on September 19, the generals were astounded to hear from M. Zankoff's own lips that all parties had coalesced for the purpose of saving Bulgaria. Soboleff and Kaulbars tried in vain to obtain M. Yonin's assent to the seizure and despatch to Siberia of all the leading politicians, and, not succeeding in this, they resigned office and left the country.

The Ring had in the meantime succeeded in persuading the three principal powers in Russia, the Czar, the military party, and the Panslavist leaders, that an independent Bulgaria was not reconcilable with Russian interests and Slavophil policy. It was resolved to upset the Prince's throne. Col. Nikolai Kaulbars was charged with the secret mission of sending home all Russian officers who had shown more obedience to Prince Alexander than to Gens. Soboleff and A. Kaulbars. It was settled that the Russians serving in the Bulgarian

Army should in future not remain longer than three years in the country, so as to run less danger of becoming attached to the Prince and people, and of preferring Bulgarian liberty to Russian oppression. Zankoff was prevailed upon to oust his Conservative colleagues from the Ministry, but soon afterwards the Russians tossed him over, and brought Karaveloff into power, who had promised M. Koyander to reserve the Vakarel-Tzaribrod line for Russian contractors. A firm of the name of Gubonin, belonging to the Ring, whose representative, a worthless fellow of the name of Zavatchi, was M. Koyander's guest, felt sure of obtaining the concession, but a Bulgarian company, formed at the last instant by a certain Grosseff, underbid the foreigners, and was charged with the construction of the line. The Russian Consul-General at once abandoned Karaveloff, and took up Zankoff, on condition of his openly advocating the dethronement of Prince Alexander. Partly in the hope of obtaining supreme authority after that event, partly with the intention of wreaking vengeance on the man whose influence with the Czar had brought about the dismissal of so many high functionaries who had zealously toiled for the Ring, the whole set applied themselves to the task of undermining his throne. At St. Petersburg the report was spread that Prince Alexander was secretly leagued with Austria and Germany for the purpose of destroying Russia's preponderance in the Balkan Peninsula, and that he had thwarted all attempts to construct such lines as might be useful to Russia in case of war. Among the Panslavists he was denounced as an enemy of the orthodox faith and Slav propaganda. In Bulgaria he was represented as in disgrace with the Czar, and as the cause of the Czar's displeasure with the Bulgarians.

With the object of effecting this riddance, the rebellion of Eastern Rumelia against the Sultan was prepared by Col. Tchitchakoff, Russian military attaché at Philippopolis. Finding that this failed to effect his overthrow, Servia was either encouraged, or at least not discouraged from making war upon Bulgaria, from which country Russia at once recalled all her officers. To everybody's surprise, the Bulgarian army accomplished wonders under their ruler's able leadership, and so, as a last stratagem, the nocturnal surprise of the Prince was resorted to, and his forcible abduction.

The author believes, or pretends to believe, that it never could have been the deliberate aim of Russian policy to convert Bulgarian gratitude and reverence into hatred, and to overthrow a prince who, up to the very last, recognized Russia's claims to the gratitude of Bulgaria, and acknowledged that he owed his crown and authority to the Czar. He considers the Czar to have been deceived by the calumnies of the Ring, which wished to give the character of national vengeance to its acts of private revenge.

Prince Bismarck has just been telling us, in his great speech of February 6, that Russia has no need whatever of adopting further "defensive" measures on her western frontier, since nobody dreams of attacking her. To-day's papers state, on the other hand, that at a military council presided over by Generals Vannovski and Obrutcheff, it has been decided to go on carrying out all the movements of troops previously fixed upon. According to our author, the latter officer is one of the most important members of the Ring. Are we to infer that the contractors, foiled in Bulgaria, are trying to bring about a war for the purpose of lucre, and have persuaded the Czar that the European Peace League intends to attack him, in order to collect vast armies, huge storers of electricity, on the frontiers? At all events, we see that an individual cannot safely be trusted with the sole responsibility for the fate of one hundred millions of souls. If a government can be led into a series of false moves by a reckless set of speculators, how much more easily can it succumb to the combined influences of religious fanaticism, military pride and ambition, and, above all, of a general dissatisfaction with the internal condition of the country, which are now rampant in Russia!

THEODOR VON BUNSEN.

LANDOR AND ITALY.

GENOA, February 11, 1888.

PERHAPS here in Genoa, instead of thinking of English literature, I ought to be meditating on Columbus and the discovery of America, or on the Bank of St. George and the Italian commerce of the Levant. But then, I am staying at the Hôtel de la Ville, where Lady Blessington once lived and where Byron often visited her; I have seen on the corner of the Place de la Bourse the little tablet which marks the deathplace of Daniel O'Connell, and I have just come from Albaro and from visiting the villas once inhabited by Byron, Mrs. Shelley, Leigh Hunt, Dickens, and Landor. With leisure and opportunity, reading becomes as desultory, and runs in as strange grooves, as does conversation in a party of pleasant people. When I was ill at Pisa last spring, I saw every day the house of Byron on one side the Arno, and that of Shelley on the other; I followed them in their walks and drives, and was induced not only to visit many other places where they had lived or stayed, but to reread most of their poems, their letters, and their lives, as well as much of and about their contemporaries. In the Life of Lady Blessington were some charming letters both from Landor and from Dickens, which as of necessity compelled the perusal of their biographies as written by John Forster.

After all, the pleasantest impression of Landor, except that derived directly from his letters, and especially the glimpses of himself in his 'Imaginary Conversations,' comes from his portrait—one hesitates to call it an exaggerated one—drawn by Dickens in 'Bleak House.' In Mr. Boythorn we find all the pleasantest traits of Landor's character, with just hint enough at the unpleasant parts of it to enable us to see him at his best, as he shows himself in his letters. His intellectual vigor, as well as his violence and his coarseness, is displayed everywhere in his works. The qualities and defects of Landor's writings could scarcely be judged more truly, and certainly not treated more delicately, than by Mr. Lowell in the February number of the *Century;* but I doubt whether the 'Imaginary Conversations' will ever be much read or admired except by those who have lived or who are living in Landor's time, either in reality or in books. They are entirely too personal, too full of the author's own life and character, too restricted to the ideas and events of his time. After so many revolutions in Spain it is not easy to recall the details of the Spanish war in which Landor took part as a volunteer; nor the sequence of constitutional and unconstitutional acts during the reign of Ferdinand VII.; nor all the shades of difference in the characters of the last Grand Dukes of Tuscany. Nor can we now become very enthusiastic over the generals and dictators who founded the South American republics. Although Landor fondly and vainly imagined that he had never made one of his characters utter a word such as the man would not himself have used, all that he really did was to write dialogue between Landor himself and a man of wood or straw, whom he tried to make different from himself, but who still resembled him at least as much as his own brother, whose works he said were sometimes taken for his own. One enjoys them more with the help of Landor's Letters and his Biography.

For reasons of my own, I have been, for the last year, living in the Italy of the first third of this century, and have seldom been out of the Italian society of that time, except to make the acquaintance of the English and French who came here then, as they do now, very often leading an exclusive and insular life in the great towns. Here I have often had occasion to meet and hear of Landor, and have been entertained and amused, and even at times indignant, at his prejudices, his enthusiasms, and especially at what seemed to me his incapacity to understand the character of the people among whom he moved. Even when he is most violent and wrong-headed, he at times expresses himself with so much humor—which is not *always* coarse or obscene—as to disarm resentment.

Fiesole and Florence seem more particularly associated with Landor's name, but curious glimpses of him may be caught during the years when he was at Como, Pistoja, and Pisa. He saw very strange goings on between Queen Caroline and her low-born lover, when idling in his boat under the summer moon,

> "Where loveliest of all lakes the Lario sleeps
> Under the walls of Como";

and was much disturbed when an agent came out from England to take his testimony. From here, too, he wrote, "A scoundrel, one Monti, wrote a most violent invective, in the form of a Sonnet, against England."

At Pisa he refused to meet Shelley, who, he says later, "had got into a scrape about me with Byron," because "his conduct towards his first wife had made me distrustful of him," not thinking for a moment of any deficiencies in his own marital life. With Byron, who was also at Pisa, he was, of course, at loggerheads. Miss Clairmont, in giving an account of the odd English in Pisa, mentions "Walter Savage Landor, who will not see a single English person; says he is glad the country produces people of worth, but he will have nothing to do with them." From Pisa, too, in a letter to Southey, he writes one of his odd criticisms of Italian poets: "Some time or other I propose to finish Dante, which I began about eleven years ago, but wanted perseverance; a twentieth or thirtieth part of what I read was excellent. You cannot say the same of Ariosto. He is a carnival poet, but he is never very bad."

Landor was much influenced by his surroundings, and frequently a passage in the 'Imaginary Conversations' not only reflects the mood in which he sat down to write, but tells of something which he had just seen or heard, or records a recollection which had come back to him. Take, for example, the Ninth Conversation of volume i between the Marchese Pallavicini and Landor himself, the scene of which is laid on the steps of the very villa which I saw just now at Albaro. It is to lead up to an exposure of the brutality of an English general during the British occupation of Genoa — an exposure which Landor naïvely thinks far more scathing and effective than a speech in Parliament. The talk, however, is chiefly about Italian architecture, trees, gardens; one particular tree on the lake of Como for which Landor would have given millions rather than have it cut down; the lack of the appreciation of the beautiful shown by modern Italians, their general bad manners, dirt, and

uncleanliness, both in country and town. Or take the Twelfth Conversation between Peter Leopold and the President Dupaty, with its discussion of Italian and especially of Tuscan character, running on into a rambling talk about miracles, religion, and superstition. Another example is the Conversation between Cavaliere Puntonichino and Mr. Denis Eusebius Talcranagh, in which the author tells the story in great detail of his petty quarrel with an English secretary of legation at Florence, full of abuse of Florence, of English, and especially of diplomatists.

Indeed, one of the great charms of the 'Conversations' is their unexpectedness and want of visible sequence; one never knows whither the writer's quickly changing moods will take him, or what surprises are not in store for the reader. In the long dialogue—if such it can be called—between the Duc de Richelieu, Sir Fire Coats, and Lady Glengrin, which begins in Genoa, is continued on board ship, and ends in Dublin, we have a long story about Tom Paine; the ill effects produced by his 'Age of Reason' on the life of an English country schoolmaster; long interviews with Paine at Paris, during and after the Revolution; the character of Napoleon; scenes of clerical and country life in mid-England, with the whole of a novel worthy of Fielding condensed into a few pages; an Irishman's visit to Rome and the Pope; life and manners in Ireland, and a discussion of the Irish question. In "Landor, English Visitor and Florentine Visitor," we find a picture of the life and character of the Grand Duke Ferdinand; a talk on Italian manners and customs; abuse of England, and especially of English Cabinet-government; curious criticisms on Italian literature and art; verses in praise of Shelley, Keats, and Burns; a reparation to Byron and Shelley; abuse of the *Edinburgh* and *Quarterly Reviews;* a skit at Wordsworth; and a lament at the contempt shown for art by all English sovereigns since Charles I.

The apologies to the *manes* of Shelley and Byron seemed necessary to Landor in the revulsion of feeling which came upon him after their untimely deaths; and they occur more than once. To Shelley, who was one of the earliest and warmest admirers of his "Gebir," he had been personally insulting; and Byron he had unfairly and spitefully attacked and criticised without mentioning his name, not only in the dialogue between Bishop Burnet and Humphrey Hardcastle, where Byron was represented by George Nelly, and Southey (in the blindness of Landor's admiration) stood for Milton, but also in an absurd, petty, and even ignorant way, in the Conversation between the Abbé Delille and Walter Landor, which contains some remarks on French and Italian poets that, if not just judgments, are at least clever and original.

When Landor leaves the domain of what he has himself witnessed and experienced, he becomes wild, absurd, and too often trivial. The Conversations between ancient Greeks and Romans should be excepted, because of the fitness and propriety of these the judgment of the reader must be guided by a great familiarity with the classics, which Landor had, and by a large experience of humanity, in which he was notably deficient. What I particularly refer to are the Conversations the scene of which is laid in Russia, Poland, or the East, on which his authorities were imperfect, and the spirit of which he by his nature could not understand.

Dialogues have been a favorite device of literary men since the times of Plato and Lucian; but it is a curious coincidence that the appearance of the first volumes of the 'Imaginary Conversations' should have been so nearly contemporaneous with that of the 'Operette Morali' of Leopardi. Landor's first volume, if my memory serves me right, came out in 1824, Leopardi's book in 1826, but his dialogues had all previously appeared in periodicals either in Milan or Florence. The inspiration, the leading motives, of the two books are very dissimilar, but I can never read one without thinking of the other. E. S.

Correspondence.

A CORRECTION.

To the Editor of The Nation:

Sir: In the article headed "The Civil Service as a Profession," published in the current number of your journal, you say:

"Therefore, let the candidate observe carefully whether he has passed a 'general' or a 'special' examination, for if the latter, his chances of appointment are slight. In 'special' examinations (as for examiners in the Pension Office), the entire eligible list is sent to the appointing officer, and the man at the foot is as likely to be appointed as the one at the head."

Will you permit me to say that upon this subject you have been singularly misinformed? The whole list of eligibles is not certified as stated by you. It is true that formerly the whole list was certified whenever a requisition was made for persons eligible to the position of special pension examiner, but within a few months after I became one of the Civil-Service Commissioners an order was made by the Commission that only the usual number of names—at that time four—should be certified in response to such a requisition. The practice of certifying the whole list of special-pension-examiner eligibles was a bad one, and would probably never have been deemed necessary to the efficiency of the pension service if the appointment of the 150 special pension examiners appointed in 1884 had not been authorized at the commencement of the very exciting Presidential campaign of that year. It is also true that formerly the whole list of persons eligible to places in the Department of State was certified, but under the new rules such a certification cannot now be made. Only three names from any list of eligibles—the three at the head—can be certified to any department. In short, in no examination for admission to the classified civil service is the whole list of eligibles now certified to any appointing officer.

I have probably said enough to convince you that the objections made by you to the manner in which the Civil-Service Act is being executed are without foundation in fact.

I have written this, for your information, with a hasty pen; but the pen, though hasty, is an accurate one.

In conclusion, I am constrained to say that I deprecate your use of the doubting word "if" in the sentence: "If the Civil-Service Act continues to be maintained," etc. That act will continue to be maintained. In the best interests of the Government it must be maintained; and all that is necessary to assure its maintenance by general consent—no, by general demand—is the enlightenment of the people concerning its operations, and the extension of the system of appointments which has been established by it within what is known as the classified service, to every part of the executive civil service of the United States.

Very respectfully, John H. Oberly.

United States Civil-Service Commission,
Washington, D. C., March 4, 1888.

PENAL EXPATRIATION.

To the Editor of The Nation:

Sir: Perhaps the most questionable feature of a law which itself has proved to be of questionable utility is the paragraph of the revised anti-socialistic bill framed by the German Government and recently presented to the German Parliament for enactment, conferring fuller and more arbitrary power upon the police to banish Socialists and all such persons, subjects as well as aliens, as may entertain and express opinions esteemed dangerous to society and subversive of the empire. The intimacy of modern international intercourse and the comity of civilized States would seem to demand that every nation should deal with its criminal classes within its own borders. The right of any State to banish its objectionable citizens or subjects implies the right to impose upon other States a burden which it confesses itself incapable or unwilling to bear, and thus to use them as penal colonies. If Germany should decide to ship her Socialists to Camerun or to any other territory under her own jurisdiction, no other government would think of protesting against such a measure, however inhuman it might be. Deportation of this kind is solely a matter of internal policy; it may be morally execrable and, from an industrial point of view, suicidal, but it concerns only the nation which practises it, and her colonies which suffer from it. But Germany has no better right to send worthless and hurtful portions of her populations to America, as she is constantly doing, than America has to import into Germany shiploads of rattlesnakes and potato-bugs. The fact that many of the persons thus expatriated were not as wicked as they were assumed to be, and have often become useful citizens of freer countries, does not affect, in the slightest degree, the principle involved.

In the jealous and turbulent democracies of ancient Greece, ostracism was not a mark of infamy, but a badge of honorable distinction; and the same may be said of the exile to which the European revolutionists of 1848 were condemned. Indeed, this holds true, in the main, of all banishment for political or religious opinions. Prussia owes much of her industrial wealth and prosperity to the enlightened policy which in 1685, gave an asylum to the Huguenots banished by the revocation of the Edict of Nantes, and in 1731 and 1732 welcomed the Salzburg Emigrants, victims of the bigotry of the Archbishop Leopold Anton, Count of Firmian. These two events may be regarded as two most important upward movements in the rise of Prussia to her present position of undisputed political ascendency over France and Austria.

Nowadays, however, nations do not, as a rule, send their foremost men into exile. If they happen to have an Aristides or a Themistocles, a Cimon or a Coriolanus, they usually prize and try to profit by the rare possession. They endure with patience even the bunkum of their blatherskites and demagogues instead of putting them over the boundaries as the Athenians did the blatant Hyperbolus. So far from banishing the most intelligent and industrious members of the community on account of theological or ecclesiastical differences, they tolerate such nuisances as walking delegates and professional strike-organizers. There is no doubt that the great majority of those who are now expatriated by European governments are persons who "leave their country for their country's good," and seldom become a boon to the lands in which they take up their abode.

But besides these semi-political refugees, of whom Herr Most and the Chicago Anarchists

are fair specimens, and in the practical application of whose crude theories error leads invariably to crime, thousands of paupers, imbeciles, vagabonds, confirmed invalids without any means of support, incorrigible offenders, and other vicious characters are landed annually on the shores of the United States. Only a few days ago (on the twelfth of February) the Bavarian police in Munich shipped a gang of this sort to New York *via* Bremen. One of them, Carl Fensterwalder, an old jail-bird, confesses that he was permitted to choose between five years' hard labor in the penitentiary (*Zuchthaus*) and emigration to the United States, and naturally preferred the latter alternative, as affording him a fresh and freer field for the peculiar kind of activity for which he had become notorious. Another, Joseph Rietberger by name, was a sickly and semi-idiotic pauper, who just came out of the hospital, and had hitherto passed the greater part of his life in the poorhouse. These two individuals may be taken as representatives of the lot. Each was furnished with a new suit of clothes, and sent under police supervision to Bremen, and thence, in the steerage, to New York, where they were to be paid twenty dollars apiece by the German Consul and forwarded by him to Omaha and other places in the West. Especial care seems to have been taken to distribute them as widely as possible over the country, no two of them having the same destination. This was done in order to avoid exciting suspicion, and not from any merciful desire to lessen the burden of pauperism and crime for us, by letting many American cities bear it, instead of imposing it upon a single community. The Bavarian police magistrate did not bid farewell to his erring and unfortunate countrymen who had had the high privilege of prospective American citizenship so suddenly thrust upon them, without a parting word of advice, and that was, "not to let the United States Consul in Munich know anything of the arrangement, lest he should succeed in frustrating it." It is to be hoped that the Collector of the port in New York, to whom a telegram has been sent, will detect this international fraud and reship the precious cargo to the fatherland. If, unfortunately, the speciousness of new clothes should enable the rapscallions to escape his vigilance, it is certainly desirable that they should be sent westward with all speed, before a reporter of the New York *Tribune* gets hold of them and urges them to apply for a pension as the easiest and quickest way of relieving their distress.

This incident furnishes a good example of what is constantly going on in all parts of Germany. Every two or three weeks the police officers have a so-called *razzia*, *i. e.*, they swoop down on the haunts of criminals, vagrants, and other vicious or worthless persons in different wards of the city and bring them up before the police court. Many are sent to their own homes or native towns, if it is possible to ascertain where they belong, but the worst characters are regarded as only fit to swell the population of the great republic over the sea.

There is also another source from which a vast stream of useless and injurious immigration is poured into the United States every year. Any one who has lived a long time in Germany and become intimately acquainted with the history of many families belonging to the middle and upper classes, will be surprised to discover how very large a number of them have prodigal sons in our "far country." After every other effort to reform the scapegraces has failed, they are sent to America to shift for themselves. In some instances the experiment proves successful; a new environment develops in them better qualities, and they grow into decent and worthy members of society. In most cases, however, they are black sheep dyed in the wool with depravity, which nothing can wash out. It would be easy, too, to make a long list of scions of nobility who are leading the lives of scalawags in our large cities. In view of these facts, it is high time that greater diligence should be used in warding off this floatage of morally and socially wrecked humanity, which is borne to us on every tide of foreign immigration. V.

MUNICH, February 16, 1888.

RAILROAD RATES FIXED BY LAW IN MISSOURI.

TO THE EDITOR OF THE NATION:

SIR: In your issue No. 1183, in an article headed "The Iowa Railroads," you use the following language:

"The proposal to fix rates on freight by an act of the Legislature is, we believe, something entirely new, going beyond anything hitherto proposed in any country in the matter of regulation of railroad property. The utmost that other civilized States have done is to create commissions or boards to consider, through actual judicial investigation, what 'reasonable maximum rates' are. No Legislature has, we believe, thus far taken this task on itself."

In the year 1875 the Legislature of the State of Missouri passed an act classifying railroads and regulating passenger rates, and classifying freight and regulating freight rates. By this act all freight transported upon any railroad or part of railroad in the State was divided into "four general classes," designated "as first, second, third, and fourth classes," and "seven special classes," designated "as class D, E, F, G, H, I, and J." The act then establishes "maximum rates" on each class of freight. These "maximum rates" are based on distance, so much "for the first twenty-five miles," so much additional for "the second twenty-five miles," and so much additional for "each additional twenty-five miles or fractional part thereof" over or under "thirteen miles."

For example: "Class E shall comprise flour in lots of fifty barrels or more, and lime in lots of twenty-four barrels or more." The rate of freight on class E is "not exceeding twelve cents per barrel for the first twenty-five miles, and not exceeding eight cents per barrel for the second twenty-five miles, and not exceeding four cents per barrel for each additional twenty-five miles, or fractional part thereof, unless the fraction be less than thirteen miles, in which case the rate shall not exceed two cents per barrel for said fractional part, unless the whole distance be over two hundred miles, when no greater rate than one cent per barrel shall be charged for each additional twenty-five miles over said two hundred miles."

The penalty for a violation of these provisions is "a fine of not exceeding two hundred dollars for each and every offence," to be paid by any agent or officer of the road who shall in any way violate or attempt to violate the law; and the person paying the overcharges can recover "three times the amount taken or received from him in excess of the rates prescribed by" the law. By the same act a board of three railroad commissioners is established, and they are given power to reduce the rates fixed by law "whenever, in their judgment, it can be equitably done." Substantially the same penalty is affixed to a violation, by overcharge, of the rates established by the commissioners as to a violation of the rates fixed by law.

These provisions are still a part of the law of the State of Missouri.

By section 14 of article 12 of the State Constitution of 1875, it is provided that "the General Assembly shall pass laws to correct abuses and prevent unjust discrimination and extortion in the rates of freight and passenger tariffs on the different railroads in this State; and shall, from time to time, pass laws establishing reasonable maximum rates of charges for the transportation of passengers and freight on said railroads, and enforce all such laws by adequate penalties."

The proposed legislation in Iowa would, therefore, seem to be not without precedent.

Yours truly, A. R. STROTHER.

KANSAS CITY, MO., March 3, 1888.

THE IMPORTATION OF LEAD.

TO THE EDITOR OF THE NATION:

SIR: The enclosed communication is clipped from the Chicago *Mining Review* of February 16:

"I desire to call attention to serious menace to the lead-mining and smelting interests of the United States, arising from the enormous increase of importations of lead ores from the Republic of Mexico *which come in without paying tariff duties*. Either through the imperfections of existing laws or through the wrongful administration of the laws, Mexican ores containing lead and silver are classified by the Custom-house authorities at Paso del Norte, and presumably at other places of entry, as *silver ores*, and are admitted free of duty when the silver content of the ore, reckoned at $1.29 per ounce, exceeds in value the lead content of the ore at forty cents per unit. . . .

"If free trade in Mexican ores is allowed to continue and grow at its present rate, we can foresee irreparable injury and speedy destruction to lead mining and smelting in the United States. The situation demands prompt and vigorous action on the part of the owners of lead-producing mines, in securing either necessary legislation or the proper enforcement of the laws."

Granting the figures—or doubling them, for that matter—it still remains true that the imposition of any prohibitory tax on these ores merely results in lessening the amount of freight carried by United States railroads, and in a diminution in the smelting industry of the Rocky Mountain region. The prices now ruling are such as to yield only the same average profit on Mexican ores as on those mined in the United States to the smelting concerns treating them.

It is curious to note, too, that coincidently with this "enormous increase" of imported lead ores, the price of lead has materially risen. With the demand for lead (in the ore) at all our smelting works, to enable them to smelt the "lean" ores which prevail in this region, and for which the works pay, quite irrespective of its "nationality," it is not easy to foresee the "irreparable injury and speedy destruction to lead mining and smelting in the United States" predicted in the *Review*. R. C.

GOLDEN, COL., February 22, 1888.

DENOMINATIONAL BLENDING.

TO THE EDITOR OF THE NATION:

SIR: Your article on "The Blending of Denominations" (*Nation*, No. 1183) interested me very much. I think, however, that one may fairly distinguish between the development of the "denominational instinct" and the "strengthening of sectarian prejudices." The history of American Christianity during the last fifty years presents far more examples of the former process than of the latter. Indeed, I know of but one important Protestant body which can properly be said to be, as a whole, intensely sectarian. Presbyterianism and Con-

gregationalism are a great deal more distinct from each other now, and a great deal less likely to think of "blending," than at the beginning of the century, when they did blend, after a fashion, much to the ultimate advantage of Presbyterianism. But while each of the two systems has become, at least on the ecclesiastical side, more true to its own historical attitude, both have long practically ceased to maintain the old Puritan theory of an unalterable polity, and adherents of both are among the warm friends of church unity. And I can conceive of a very effective organization of Christian forces in this country which would not obliterate denominational lines.

What you say of Congregationalists and conservative Unitarians might be, and has been, illustrated in other ways. Whatever one thinks of the denials of the early Unitarians, it is certain that they were defending the divine fatherhood against men who had unintentionally done their utmost to make it incredible, and the divine unity against unconscious tritheists. As to the latter point, a quotation from the Athanasian Creed was once taken by a Unitarian and by an Orthodox Congregationalist, for a statement of Unitarian doctrine.

Your mention, in another column of the same issue, of the proposed collection at Leipsic of publications relating to the religious history of the United States, prompts the question whether there is anything like a complete collection of that sort in this country. Partial ones of great value, of course, exist, and additions to them are welcomed. But I am not sure that an attempt like that which Dr. Gregory is now making in behalf of a German university has ever been made here, and very sure that, if not, it ought to be made at once. W. G. A.

GUILFORD, CONN., March 3, 1888.

THE CRADLE OF THE ARYAN RACE.

TO THE EDITOR OF THE NATION:

SIR: In your number of March 1st an opinion is ascribed to me, I do not know on whose authority, which I never held. In my book, 'Die Arier,' I distinctly locate the birthplace of the Aryans in the great swampy region, the Palus Magna of mediæval writers, in which the river Dnieper takes its rise. The idea of southwestern Germany being the cradle of the Aryan race sprang from the fertile brain of the late Lazarus Geiger, with whom should rest authorship and responsibility.

Respectfully, THEODOR POESCHE.

WASHINGTON, D.C., No. 1224 12TH ST., March 3, 1888.

[In Max Müller's "Poesche restricts their home to the sources of the Danube" ('Biographies of Words,' etc., p. 107), "Danube" is probably a misprint for *Dnieper*.—ED. NATION.]

Notes.

THE 'Early Days of Mormonism,' by J. H. Kennedy, with portrait and other illustrations; and 'What is the Bible?' by Prof. George T. Ladd, are in the press of Chas. Scribner's Sons.

Thomas Whittaker will shortly publish 'Lectures on the Prayer Book,' by the Rev. W. A. Snively.

Through D. Appleton & Co. the Rev. J. I. Mombert will issue by subscription a 'History of Charles the Great (Charlemagne)' in one octavo volume.

'Ten Years of Massachusetts'—that is, Massachusetts as reflected in her legislation during the past decade—by Raymond L. Bridgman, is announced by D. C. Heath & Co., Boston.

P. Blakiston, Son & Co., Philadelphia, announce 'Chemical Technology: The Application of Chemistry to the Arts and Manufactures,' edited by Charles E. Groves, F.R.S., and Wm. Thorp, B.Sc., F.I.C., in about eight volumes, with numerous illustrations.

Ginn & Co. bring out immediately 'Helps to the Intelligent Study of College Preparatory Latin,' by Prof. Karl P. Harrington.

Among D. Lothrop Co.'s forthcoming publications are 'Volcanoes and Earthquakes,' by Samuel Kneeland, and 'The Deathless Book,' by the Rev. D. O. Mears.

Simultaneously with Macmillan's series of lives of English Statesmen comes the beginning of W. H. Allen & Co.'s "Statesmen Series," to be edited by Mr. Lloyd C. Sanders. The first volume, 'Beaconsfield,' by Mr. T. E. Kebbel, is now ready, and among those to follow are 'O'Connell,' by Mr. J. A. Hamilton, 'Gambetta,' by Mr. F. A. Marzials, 'Gortchakoff,' by Mr. Charles Marvin, and the 'Prince Consort,' by Miss Yonge. The editor will himself write the life of 'Palmerston,' already handled in an earlier and still-born series by the late Anthony Trollope, who was always as ready to prepare the biography of Cæsar, Cicero, Thackeray, or Palmerston as he was to turn out a novel or a book of travels.

The pleasant announcement comes from London that we are to have a new edition of Colley Cibber's 'Apology,' the best theatrical autobiography in existence. It will be published by Mr. Nimmo uniform with his recent edition of Dr. Doran's 'Their Majesties' Servants.' The editing has been intrusted to Mr. Robert W. Lowe, than whom there is no one more competent. Cibber's 'Apology' is one of the books which cry aloud for a new edition, as the latest, the so-called Bellchambers edition, is half a century old and was ill made.

The 'Geographical Review of the Fishing Industries and Fishing Communities for the year 1880,' just issued from the Government Printing Office, is not so stale as its date might imply, for it is really half a census volume by coöperation, though issued by the Fish Commission. Prof. G. Brown Goode is the responsible author, and the contents are full of interest and instruction. An appendix contains a curious compilation of "Historical References to the Fisheries of New England" from the earliest times, by Mr. A. Howard Clark, and its literary flavor makes one wish for it a separate reprint in a more handy form. It appears that at Ipswich, Mass., as far back as 1637, shad and alewives were used for fertilizing the soil.

Cassell's 'Pocket Guide to Europe' comes to us afresh in its very handy form. The revision asserted on its title-page has not extended to the list of United States diplomatic and consular agents on pages 464–467, though, thanks to the stability of that service under our present Administration, the defects we have observed are not serious.

Dr. Francis H. Brown's 'Medical Register for New England' (Boston: Cupples & Hurd) has an established character as a well-edited and trustworthy record for the medicinal, dental, and pharmaceutical professions. It is now issued in a new edition, brought down to the close of the last year. Its scheme is (1) to enumerate and describe the associations and societies within its scope, with lists of officers; (2) to do the same by asylums, etc.; (3) to include miscellaneous allied matters; and (4) to give the membership of the several State medical societies.

Another class is served by Mr. Albert S. Bolles's 'Bankers' Almanac and Register' (Homans Publishing Co.), of which the first of the semi-annual editions for 1888 lies before us. Besides the information strictly pertinent to the title, a "list of reliable attorneys" in the United States and in Canada is appended.

A volume of 'Patriotic Addresses' delivered in America and England from 1850 to 1885 by Henry Ward Beecher has been compiled by John R. Howard (Fords, Howard & Hulbert). The contents have been well chosen, and well represent Mr. Beecher's extraordinary powers as an orator, and his eminent services while abroad to the struggling cause of the Union—services which no other American was, on the whole, so competent to perform. The compiler has prefixed a biographical sketch of Mr. Beecher, written from the point of view of close personal intimacy, but with discrimination. The portrait engravings other than those of Mr. Beecher himself are for the most part pretty bad. The print is clear and the volume well calculated for popular circulation. We quote a passage from the Manchester speech of October 9, 1863, for its bearing on a recent controversy in these columns: "It has been said that she [New York] sold her slaves. No slander was ever greater. The most careful provision was made against sale. No man travelling out of the State of New York after the passage of the Emancipation Act was permitted to have any slave with him, unless he gave bonds for his reappearance with him," etc. (p. 446).

'Reform of London Government and of City Guilds,' by J. F. B. Firth, is the latest addition to Sydney Buxton's "Imperial Parliament" series (London: Swan Sonnenschein). No one has more completely identified himself with this question than Mr. Firth; hence for a succinct survey of the arguments in favor of London municipal reform, no better book than the one before us can be recommended. The question at issue is a momentous one, and must soon come to the front in English politics. Before many decades elapse, turtle soup at the public cost will cease to tickle the palate of the London alderman. Mr. Firth's booklet will help to hasten this consummation.

We have already noticed the memoir of the late Prof. Fleeming Jenkin by Mr. Robert Louis Stevenson as published in its detached form. This memoir forms, for the general reader, much the most interesting portion of the two volumes of 'Papers, Literary, Scientific, etc.,' which are Prof. Jenkin's literary monument (Longmans). The rest of vol. i is filled with reviews in the Scottish quarterlies, and articles in various periodicals, on the "Agamemnon" and "Trachiniae," on Darwin and the 'Origin of Species' (1867), on Lucretius and the Atomic Theory, on Mrs. Siddons as *Lady Macbeth*, on Talma on the actor's art, on the antique Greek dress for women (illustrated), on rhythm in English verse, on George Eliot, on artist and critic, together with an original three-act play, "Griselda." The second volume is occupied with papers on economic, mathematical, and technical subjects—trade-unions, supply and demand, incidence of taxes, technical education, submarine telegraphy, etc., etc. This list shows the range of the writer's sympathies and acquirements. His limitations are suggested by his belief that his argumentation against Darwin in the *North British Review* had demonstrated the theory of the origin of species to be without sufficient support from the evidence, and "false by accumulative proof."

The January number of the *English Historical Review* opens with a review, by Mr. G. W. Prothero, of "Gneist on the English Constitution"—not his 'History of the Constitution' alone, but also his work upon the English Parliament, being the subject of the review—only those works, it will be noticed, which have been translated into English. It is a profitable article to read, as not merely are Gneist's opinions stated with lucidity and criticised intelligently, but the critic has opinions of his own which are worth considering. The next article is by Miss Robinson, "The Claim of the House of Orleans to Milan"—a claim, it is well known, which is the key to the most important international events of the beginning of the sixteenth century. The paper states clearly the nature of the claim, after which we have not so much a discussion of its validity as an excellent sketch of the historical events growing out of it; the present article, part i, ending with the accession of Francesco Sforza to the ducal throne of Milan in 1450. The third article, "Benoît de Boigne," by Sidney J. Owen, is, like an earlier article upon Dupleix by the same writer, devoted to the history of India, in connection with the establishment of the British rule there. De Boigne was, says the author, "the most eminent of these European adventurers, alike from his abilities and character, the greatness of his achievements, and their momentous consequences." He was a Savoyard by birth, was born in 1751, and died in 1830. Of the other contents of the number we will mention a posthumous paper by the late J. F. McLennan on "The Origin of Exogamy," and a review, by Dr. Robertson Smith, of Renan's "Histoire du Peuple d'Israël."

The December number of the *Antiquary* begins with a paper by Mr. G. Laurence Gomme upon "Open-air Assemblies"—the subject of the book by which he first made his reputation. The present article contains some interesting illustrations of this early custom in English towns and manors. This is followed by one of Sir J. H. Ramsay's useful articles upon royal accounts—a concluding article upon the "Accounts of Edward IV." A paper upon "The Customs of Dymock" contains a valuable statement of the legalized customs of the manor, as confirmed by Cromwell in 1657. The article upon London Theatres (No. 7), by Mr. Ordish, is the conclusion of "Whitefriars: Salisbury Court." The illustrated series of articles upon "The Crosses of Nottinghamshire," by A. Stapleton, has part iv in this number and part v in the January number, where we also find an illustrated paper upon "The Bells of Kent." Other articles in the January number are "The Christmas Pantomime," by Mr. Gomme; "London Homes of Dr. Johnson," by C. A. Ward; "English Religious Drama," by W. H. Hudson, and "Henry Howard, Earl of Surrey" (illustrated), by William Brailsford.

Sir Charles Bernard, late Chief Commissioner of Burmah, contributes a strikingly clear and interesting account of that country to the February *Scottish Geographical Magazine*. After describing its physical features, he treats of the people, whose numbers he puts at 9,250,000, a little over one-half being Burmese. Of their condition he draws an unusually bright picture. Their wages are four times as high as those of the natives of India, and their manner of living proportionately more comfortable. There are no great landlords, nobility, nor aristocracy, save the officials. Every village has a school attached to its monastery, in which the boys are taught to read and write. Sir Charles speaks highly of the Buddhist priests, numbering 25,000, the strictness with which they keep their vows of celibacy and poverty, and the respect in which they are held by the people. The staple industry is agriculture, rice being the principal crop. The teak in Lower Burmah is nearly exhausted, but there are still vast teak forests in the upper country, which are to be carefully preserved by the Government. Organized resistance to the English, the guerrilla warfare, has ceased, but dacoity is such a social institution that it will take a generation or two to root it out. A Burmese maiden will not smile on a youth who has not shown his prowess as a dacoit. It is singular that notwithstanding the high wages and the special inducements offered by the Government to Indian immigrants, very few come or can be prevailed upon to stay. Upper Burmah does not yet pay, but Lower Burmah yields a million annually to the Indian exchequer.

The principal article in the February Proceedings of the Royal Geographical Society is an account of an exploration of the Rio Dôce, a Brazilian stream falling into the Atlantic just north of Rio de Janeiro, by W. J. Steains. Though the basin of the river is very fertile, containing some of the richest land in the empire, it is almost unexplored, and is inhabited only by a race of Indians, who have prevented any regular settlement on its banks. At Guandú, about a hundred miles from its mouth, Mr. Steains came upon the miserable remnant of a colony of our own people, who, at the close of the war of the Rebellion, were induced by the glowing promises of the Brazilians to leave the South and settle in this wilderness. Four or five only of the original number were left, too poor to get away. The Indians, the Botocudo, with whom he lived for two months, he believes to be undoubtedly cannibals.

The French have recently succeeded in taking a gunboat from eastern Senegambia down the Niger to Timbuctoo. The greatest difficulty which Lieut. Caron encountered was the lack of fuel; the inhabitants of the countries passed through, though unfriendly, not interfering with their progress. Bandiagara, the principal city of the Toucouleurs, is described as a very important Mussulman centre. "The city seems like a vast monastery, where one hears only the chants of the muezzin and sees only people at prayer." Notwithstanding this appearance of devotion, the people are excessively depraved. It does not appear that any of the party actually entered Timbuctoo, nor was the commander able to make a treaty with the Touaregs, who are now the masters of it, so great was the opposition of the chiefs and the Moorish merchants who hold a monopoly of the trade. Though unsuccessful in this respect, the large collection of the fauna and flora, and the observations of the river, its course, commerce, and inhabitants, promise to add very largely to our knowledge of this rarely visited region.

The Russian Imperial Academy of Sciences and the Geographical Society have on hand a new and extensive expedition, which it is intended to carry out during the present year. This expedition, which has in view purely scientific as well as practical ends, aims at the prosecution of various investigations in obscure and little known localities in Siberia, viz.: in the Narymsk district, settled by Tunguses, Ostiaks, and several other native tribes, which are gradually dying out. The expedition intends to prosecute its investigations for the space of three years. It will be undertaken by Mr. Adrianoff, a learned member of the Geographical Society. The programme is not yet fully worked out; the collection of ethnographical and statistical data will enter into it, the latter being taken for the Tomsk Statistical Committee, among others. In addition to this, the expedition will study the local dialects.

The Franklin Society of Providence, R. I., has lately issued a report on the Geology of Rhode Island that will prove of value to the working geologist. It contains a list of all geological and geographical publications concerning the State, and a brief account of their contents; a list of fossils and minerals, and of localities of geological interest. As preparation for future work, the report advocates the preparation of a good topographical map, such as that now under way in Massachusetts. If the Franklin Society and the Newport Natural History Society act in concert, they can doubtless secure this result, and a modest annual appropriation for the geological coloring of the maps as well.

Mr. William R. Jenkins has republished 'La Neuvaine de Colette' in his "Romans Choisis." This pretty little romance appeared anonymously in the *Revue des Deux Mondes* in September and October last, and was republished in a volume in January, still without any author's name, by Calmann Lévy (Boston: Schoenhof). It is bright and lively, in some parts really charming, and always interesting, and it is entirely unobjectionable in the direction in which French stories so often offend. At the same time it has absolutely no moral aim to render it unattractive to the most frivolous reader, and neither psychological analysis, nor realism, nor literary theory of any kind to offend the old-fashioned few who do not read to be tortured or instructed in pessimism, but only to be entertained. An English translation has just been brought out by D. Appleton & Co.

Among recent important Paris publications is the fourth volume of 'La Fontaine,' edited by M. Henri Regnier, in Hachette's collection of the "Grands Écrivains de la France." The first three volumes contained the Fables; the present is the first volume of the 'Contes et Nouvelles.' Hachette has also published 'Beaumarchais et ses œuvres; précis de sa vie et histoire de son esprit,' by M. E. Lintilhac. Another work on the same subject, by the way, has just been issued by Plon & Nourrit: 'L'Histoire de Beaumarchais, par Gudin de la Brenellerie: mémoires inédits publiés sur les manuscrits originaux,' by M. Maurice Tourneux. The same publishers announce, to appear soon, the second and concluding volume of Monseigneur Ricard's work on the famous Abbé Maury, 'Le Cardinal Maury, 1791–1817.' The first volume, 'L'Abbé Maury, 1746–1791' (Boston: Schoenhof), appeared towards the end of last year.

Félix Alcan has just published the second volume of the 'Papiers de Barthélemy, ambassadeur de France en Suisse, 1792–1797,' edited by M. Jean Kaulek, head of the Historical Department of the Archives of the Ministry of Foreign Affairs. The present volume embraces the period from January to August, 1793.

New and old are relative terms, and the "new edition" of Webster's Dictionary now being delivered in parts to subscribers in Germany by Asher & Co., Berlin, is, to judge from the specimen page, a simple reprint from the plates of the latest edition in our market (1880). It is sold for seven dollars and a half.

On February 22 a hundred years had elapsed since Arthur Schopenhauer first saw the light in Danzig. It is proposed to publish a complete collection of his private letters. The volume will be under the editorial care of Dr. Ludwig Schemann of the University of Göttingen, well known for his acquaintance with the works of Richard Wagner, who made the great pessimistic philosopher his guide. The

book will be published by F. A. Brockhaus of Leipzig, and all the receipts are to go towards the Schopenhauer monument fund. Letters in the possession of persons in this country may be sent in care of Dr. Cyrus Adler, Johns Hopkins University, Baltimore, Md., who will have them copied and returned to their possessors as soon as possible.

—The March *Century* has no one article that rises very much in interest above the rest, but there are half-a-dozen of real excellence. Mr. John Bigelow's account of the home and personality of De Chaumont, who gave Franklin the hospitality of his house in Paris, is a pleasant illustration of the friendship which existed between France and America in the days of our Revolution; and the story of the speculations of the French syndicate, as we should now term it, in northern New York, is also an interesting piece of local history. The Chaumonts, by means of it, left their name upon our map. The episode of the making of the tunnel from Libby Prison, by which over a hundred prisoners found their way out, is told with great spirit, and gives a touch of variety to the War-Papers series. Mr. Roosevelt's description of his ranch and its employments, and of the character of the Bad Lands, near which it is situated, with a few anecdotes of personal experience, makes a good paper; and the portraits of Bismarck are equivalent to an article. By far the most important contribution is Mr. George Kennan's exhibit of the state of Russian political prisoners while in confinement before trial, or afterwards in the interval between sentence and deportation to Siberia, in which period, according to the words ascribed to a Director of the Imperial Police, the purpose of the Government is "to break their character." This means, to so reduce their physical and mental strength that they will never recover any vigor of mind or body. The instances given are revolting to the extreme of inhumanity, and yet Mr. Kennan states that he does not think there is any exaggeration in the narratives told him. If only a portion were true, however, the verdict of civilized men would be little modified. One touching anecdote is related of how the prisoners in the House of Detention succeeded in eluding the authorities, so that on our centennial Fourth of July they hung their cell-bars on the court with little American flags and colors made of rags, which were of course soon seized by the guards; but at night they illuminated also with inch-long pieces of candle which they had distributed to each other through the water-pipes leading from cell to cell. Considering who these prisoners were, and what their fate probably has been in the twelve years since, the incident is one of unspeakable pathos.

—The moiety of the Walter L. Newberry estate falling to the library bearing his name in Chicago is $2,149,201.60, truly a princely foundation for a library, and an endowment surpassed, we suppose, by no other. Even the Astor, after thirty-nine years of benefactions from the Astor family, counts a smaller endowment fund, $1,430,112.23, summing up donations and increase to date. The Newberry Library's promise, however, is rather more brilliant than the beginning; for it appears that more than half of the property, as well in the aggregate as in the half reserved for the library, consists largely in unproductive real estate. Yet the net income, after deducting $50,000 specially appropriated for the purchase of books and general expenses, amounts, since December 9, 1885, to $67,778.12. But this condition of the funds probably makes it difficult for the trustees to do as much at the start as they otherwise would in the way of building. Temporary quarters are occupied by the collection at present, which numbered January 1 6,457 volumes and 4,907 pamphlets. About 4,500 of the works belong to the class of American history; and 584 are the bibliographical apparatus, a department of the first necessity, if a library expects to do thorough cataloguing. Mr. W. F. Poole, of long experience in the Chicago Library and elsewhere, is the librarian, and his well-known genius for the work may be expected to benefit the public with something original and practical, in building as well as in management. The trustees have decided to make the library a library of reference.

—The death of Miss Alcott, which occurred on Tuesday, is made the sadder by its close sequence upon her father's dying on Sunday. No daughter could have been more devoted, and few have had more trying occasions for filial self-sacrifice. She derived from her mother, to whom the family mainly owed its support while being reared, the practical qualities so wofully lacking in her father. Her literary gift may have been a divided inheritance. With the exception of 'Hospital Sketches,' we believe all her work falls under the head of fiction, and much the greater part of this addressed to the young. Yet she drew so largely upon her own experience that a good deal of the family history and of history in a larger if not very important sense—such as is inherent in Hawthorne's 'Blithedale Romance'—was conveyed in her many volumes. Her success was remarkable, but we doubt if she valued it for any reason so much as for its enabling her to bring comfort to a home always on the verge of poverty, and especially to the parent who has just passed away. Opinions differ as to the quality of her juvenile tales, and we must ourselves profess not to regard them with the same favor that the public has shown, or to think them free from the fault sometimes of unreality, and too often of having the adult reader in mind instead of the child alone. We judge her, too, to have reached the limit of her inventiveness, so that she will be less missed from the walks of literature than from the social circle to which her amiable qualities endeared her.

—If we may judge from the Preliminary Report of the American Eclipse Expedition to Japan, lately published by Prof. Todd, some compensation, if not astronomical, may be found for the severe disappointment of eclipse day, in that the labors of the naturalist of the party, Dr. Holland, may be expected to result in much good to science. During the sojourn of the Expedition, and with the able assistance of native collectors, the work of the botanist went on almost daily—the work of the entomologist by day and by night. The acquisitions of insect fauna will prove much the most valuable, of which, in addition to his own collections of 6,000 specimens representing 1,200 species, mainly *lepidoptera* and *coleoptera*, Dr. Holland obtained by purchase the entire collection of the *pyralidæ* of Japan made by the well-known authority, Mr. H. Pryer, and representing the labors of nearly seventeen years. This contains about 4,000 specimens of nearly 400 species, the larger part of them undetermined as yet, and possibly new to science. The collection covers the entire group of the Japanese islands, including the Loo-Choo and the Bonin Islands, and contains typical specimens of many of the forms described in recent years by Mr. A. G. Butler of the British Museum. A monograph on the *pyralidæ* of Japan is now in preparation. Other work of the Expedition, on the ascent of various mountains and volcanic cones in Japan, from 6,000 to 13,000 feet elevation, will be reported to the Harvard College Observatory.

—Gen. Francis A. Walker, in the *Quarterly Journal of Economics* for January, makes some suggestions about the next, the eleventh census, and presents very interesting information about the last census, concerning which there is no more competent authority. Condemned for its extravagance, the tenth census was, in reality, very economical; the cost of it per head of the population, aside from printing and engraving, being only 9.68 cents, which is less than a cent a head more than the cost of the ninth census, although the population of the country had greatly increased in the meantime, and a great variety and extent of new statistical work was undertaken, and the traditional classes were advanced into far minuter details. Gen. Walker's original estimates of the cost of the work were, for reasons that he states, far exceeded; but the expense of it, $4,853,350, aside from printing and engraving, was kept within this limit only by the most painful economy at all points where saving was possible, and by pushing the clerical force forward at a rate of which Government offices in Washington have little experience. As to printing, engraving, and paper, the cost of printing the last report of the Commissioner of Agriculture was $200,000; and the cost of printing the eighteen quarto volumes of the census, already published, including the four quarto volumes yet to come, including also all the other printed matter of the census—the bulletins, two octavo volumes of the Compendium, etc.—will be less than the cost of printing the Agricultural reports since 1880. Although ninety-nine hundredths of the four remaining volumes have been for some time stereotyped, and only await an appropriation for printing and binding, the duration of the work suggests (so near are we to the beginning of a new enumeration) the advisability, from an economical point of view, of making the office permanent. This would avoid the necessity of suddenly raising and then disbanding a large force, to begin anew with workers without experience. Prof. Walker, also, would have the census taken once in five years, and confined to population and probably agriculture. In the intervening years the other statistics might be collected; and in this way the census takers, having fewer inquiries to make at one time, would attain a greater accuracy. The Bureau of Statistics of Labor in the Interior Department, which has had charge of the work since 1850, should have the supervision of it. The census of 1880 failed outright only in respect to churches and private schools. Our mortality statistics, however, leave much to be desired. Gen. Walker has words of strong praise for the treatment of the returns of deaths by Dr. Billings and his corps of assistants throughout the country; yet seems to think that it requires a very considerable effort to bring the number of deaths reported up to seventy per cent. of those actually occurring during the year. Aside from the class of births and deaths, the United States have occupied almost from their beginning the first place among the nations as to the extent and variety of their statistics. The other main articles in this number of the *Quarterly* are Prof. Hadley's on the workings of the Inter-State Commerce Law, and Mr. Sidney Webb's on the rate of interest and the laws of distribution.

—An unusually interesting discovery has been made by the American School of Classical Studies at Athens. Icaria has been found, the first home of the god Dionysus in Attica, and the birthplace of the Greek drama. The Ger-

man scholar Milchhöfer, on his way from Marathon to Athens last May, discovered at a little place called Sto Dionyso a choragic monument in the apse of a ruined church. The ruins showed that an important sanctuary had stood there, an inscription showed that an offering was dedicated by an Icarian, and the inference was easy that this was Icaria. The ruins lie at the foot of the northeast slope of Mt. Pentelicus, in a thick grove of pines, surrounded by glens rich in springs and large plane trees, with two glimpses of the sea—one of the most beautiful spots in Attica. Milchhöfer issued an appeal for the careful examination of the spot, which was echoed by the French archæologist Reinach. Early last autumn Professor Merriam, the Director of the American School, applied for permission to excavate there. After many delays, the permission was granted. One of the members of the school took a hammock and provisions, and established himself in an untenanted building near the ruins, and hired a dozen workmen. A number of fragments of works of art have been found, and the most complete proof from inscriptions that this was the sanctuary of Dionysus at Icaria.

—We learn further that the site of the sanctuary of the Kabeiroi in Bœotia, mentioned by Pausanias (ix,25,5), has been discovered, and will be excavated by the German Institute in Athens. The manner of its discovery was characteristic: Some small bronze votive cows bearing the inscription ἱερὸν Καβείρων were offered for sale in Athens, and the attention of M. Kavvadias, the Inspector of Antiquities, being called to them, he followed up the matter, and traced them to a dealer in antiquities at Thebes. In company with Dr. Dörpfeld, he went thither, found the men who had dug them up, and from them learned that the site of discovery was near Thespiæ. The two gentlemen visited the place and satisfied themselves of its identity, with the result announced above. M. Kavvadias, by the way, has recently begun work again at Epidauros, it being his intention this time to lay bare everything connected with the sanctuary of Asklepios. We learn that already the excavations have yielded valuable results, such as the discovery of the walls of the sanctuary, fragments of columns, two altars, and a doorway. Among the objects found are 500 votive animals in terracotta, more than a hundred votive cows in bronze and lead, and a large number of fragments of painted vases, probably also votive. These investigations do not seem likely to contribute much to the knowledge of Greek art, but if they clear up some of the mystery regarding the Kabeiroi and their cult, they will be an important contribution to the study of mythology.

—We can recommend as a highly interesting bit of biography the short life of Alfred Krupp, lately written by Schmidt-Weissenfels and published by Rosenbaum & Hart of Berlin. In an age like ours, the story of any man's rise from poverty to almost fabulous wealth can hardly fail of possessing a certain amount of dramatic interest for everybody. All of us—even the austere sociologists who manage the campaign against "capital"—are so keenly alive to the conveniences of a personal surplus that when we hear of a man who has become enormously rich we like to know just how the thing was done. But it is not always that the story of a modern money-king's career has that morally exhilarating quality which ought to pertain to good biography. A fortune made by the manipulation of stocks, or by a lucky investment in the nick of time, or by getting Congress to help one build a railroad, or by securing a monopoly for one's wares through legislation, may perhaps touch the carnal imagination, but it can hardly stir the deeps of one's moral nature. But the life of Krupp, as told by Schmidt-Weissenfels, is a continual object lesson upon the winning qualities of energy, courage, and self-reliance. We do not say that the life has no other suggestions, or that it presents nothing but edification to the moral philosopher. Whether the invention of a cast-steel breech-loading cannon, a little more deadly than anything any one had made before, is to be regarded as a benefit to the human race, is a perplexing question which we cannot now discuss. It was a question in which Krupp did not interest himself. His ambition was for Prussia, and there can be no doubt whatever that the two thousand Krupp guns that encircled Napoleon at Sedan September 1, 1870, were of great "benefit" to Prussia. From beginning to end, Krupp's reliance was upon the superiority of what he had to sell. When competition was going against him, he concentrated his energies upon the production of a better article. Not the least interesting part of Schmidt-Weissenfels's sketch is to be found in the extensive quotations he gives from the various manifestoes issued by Krupp to his workmen after social democracy and the labor question had invaded his territory. In one of these we find the following:

"In the various classes of society there are people who erroneously hope for the betterment of their position from changes in the constitution, the government, or the laws, and in so doing neglect the most essential agencies, which lie in their own power. Industry, order, and economy are the best and safest protection against the distress complained of, and, where these are lacking, the best government and the best laws do no good."

We should think that labor literature of this sort might be useful at the present time both in Germany and in some other countries.

BOLLES'S NATIONAL BANK ACT.

The National Bank Act and its Judicial Meaning. By Albert S. Bolles, editor of the *Bankers' Magazine*, etc. New York: Homans Publishing Co.

THE national banking system has been in operation twenty-five years, and in October, 1887, there were 3,049 national banks doing business, with a capital of $578,462,765 and deposits amounting to $1,249,477,126. The immense resources represented by these amounts are managed by over six thousand presidents and cashiers, to say nothing of directors, all of whom need to know something of the laws of the United States under which their banks are operated. The "National Currency Act" became a law on February 25, 1863. Owing to some imperfections it was superseded by the amended act of June 3, 1864, and the last-mentioned law, with the amendments and additions since made, forms what is generally known as the "National Bank Act."

In the course of twenty-five years the practical operation of this collection of laws has been very thoroughly tested. They have been construed in legal contests between the banks and their debtors and creditors, in judicial reviews of official action, and in opinions of the law officers of the United States. Almost every point upon which questions can arise has been interpreted by the courts. When, to the law itself and the history of its enactment, are added the decisions of judicial tribunals, the opinions of law officers, and the rules of administration adopted by the Comptroller of the Currency, the Treasurer of the United States, and the Secretary of the Treasury, a very large mass of material is collected, which must be studied by those who desire to know the true effect of each section of the National Bank Act. The managers of the 3,000 banks are daily beset with questions arising in the transaction of business, which must be promptly decided with due regard to the latest construction of legal enactment. 'The National Bank Act and its Judicial Meaning' is the result of an attempt to compile and arrange in concise form for ready reference the numerous laws, amendments, decisions, opinions, and official regulations, that form the code under which the business of national banking is to-day conducted, and by which are determined the rights and liabilities of stockholders and customers, and the duties of bank and Government officials. The value of an exhaustive and reliable work of this description cannot be too highly estimated, and every public officer dealing with national banks, and every official of the latter, would find his labors lightened by it.

An examination of this book unfortunately discloses that it does not fulfil the promise that its title and scope imply. It may be said in approval that the arrangement is excellent, the index full, and that the information given in the appendix as to the organization, extension, and management of national banking associations, and for the handling of United States bonds and the redemption of currency, is from official sources, and apparently reliable. Further credit should be given for the accurate references to the judicial decisions applying to each section quoted. There are in the body of the book nineteen chapters, each treating of a special subject, among them: "Powers of the Comptroller," "Organization of National Banking Associations," "Powers of National Banking Associations," "Rights and Liabilities of Shareholders," "Interest," "Taxation," "Criminal Offences," etc., etc. The sections of the National Banking Law applying to each subject are grouped in the corresponding chapter, and, as each section is taken up, the necessary explanations are made, fortified by references to the various decisions, opinions, and regulations which affect the practical operation of that portion of the law.

Mr. Bolles is well known as the editor of the *Bankers' Magazine*, and as the author of a financial history of the United States, and of several other books on kindred subjects. He is also Professor of Political Economy and Finance in the University of Pennsylvania. This, his last work, is one of the best, but it is the least original. Much of the material has been derived from sources to which no credit is given. The impression apparently sought to be produced is, that the book is the result of a laborious exploration of an unknown field; that the cases and opinions cited have for the first time been gathered from the State and Federal reports, and from other original documents. The value of the book would have been materially enhanced if full information had been given as to the origin and growth of the Banking Act, and the commentary upon it, with due credit to the various writers upon these and kindred subjects, whose publications have the high sanction of general approval. These references might have been embodied in a preface sketching the gradual growth of the material which Mr. Bolles has so skilfully utilized.

The absence of such references is a grave defect, and is but poorly compensated for by any factitious credit for original research which the author may acquire. It is important to know the form of the law at different stages of its history; how the language and effect of the act of 1863 differed from that of the act of 1864, or

as it subsequently appeared in the Revised Statutes of the United States. It is further exceedingly valuable in legal practice to understand the underlying reasons that led to the various changes and developments of the law as they occurred from time to time. All this, we repeat, might have been explained in a preface. But, further, an analogous defect pervades the body of the work in that it does not give the dates of decisions cited, or the adjudicating tribunals, or the dates of the official opinions. The preface might have set forth the comparative values of decisions on the same point in Federal and State courts, and thus aided laymen to form some intelligent opinion as to the worth of those decisions. Where there are conflicting decisions, no attempt is made to correlate the points of agreement so as to arrive at the best attainable resultant. This to a lawyer may be no great disadvantage, but the book is intended for laymen, for bankers to refer to at a moment's notice. As another result of the absence of a comprehensive view of the material handled, obsolete laws are given prominence when they should have been omitted; decisions are cited, without distinctive remark, which have been seriously affected as authorities by those of later dates and of higher courts; and laws actually in force are omitted, because erroneously supposed to be obsolete.

An example of the retention of an obsolete law is that of the sections imposing the two-cent stamp tax on bank checks (pp. 272–273) without referring to the repeal, in 1883, of this law, so long regarded by the banks and the public as unequal and burdensome. The chapter on taxation, commencing on page 222, affords an example of a citation of decisions without regard to their order in date or relative force. No subject has been so prolific of controversy in the courts as this, and it is to-day of vital importance to the banks. The decisions rendered have been most contradictory and confusing, and require to be most carefully arranged and considered in order that a national bank in any given State may acquire intelligent information as to the course of conduct it should pursue in order to avoid unjust taxation. The failure so to arrange and consider in this chapter is rendered more conspicuous by the fact that Mr. Chauncey P. Williams of Albany has prepared a most exhaustive and satisfactory paper on the subject, which was read at the Convention of the American Bankers' Association at Pittsburgh in October last.

A most important omission in the book of Mr. Bolles is that of section 5242 of the United States Revised Statutes, providing that no attachment, injunction, or execution shall be issued in any suit in any State, county, or municipal court against a national bank, before final judgment. This section is necessary to the protection of the banking business, and prior to 1882 the courts had rendered several decisions recognizing its force. The act of July 12, 1882, contained a proviso radically changing the standing of national banks before judicial tribunals, and immediately a question arose whether section 5242 was abrogated by the later act. It was then decided that the section had not been affected by the act of July 12, 1882, and that it continued in force as before.

It only remains to consider the sources from which Mr. Bolles has drawn the main part of the material for his book, as to which source he has maintained a strict silence. The ground he has covered, far from being an unknown field, had previously been investigated by many explorers. There are a very large number of works similar in character to the one under examination, in which some parts of the subject have been treated with a skill and tho roughness leaving little to be desired. First and foremost, the reports of the Comptrollers of the Currency from 1863 to 1887 are a mine which has been freely drawn on. The report for 1875 contains a synopsis of all the decisions of the United States Supreme Court affecting national banks made up to that date. This synopsis of decisions was enlarged the next year so as to contain not only decisions of the United States Supreme Court, but those of State courts of last resort, and has been continued and enlarged by new cases year by year to the present time. Another source is the very valuable compilation of national-bank cases by the editors of the Albany *Law Journal*, Messrs. Thompson & Brown, all cases to 1878 having been compiled by the former, and those between 1878 and 1881 by the latter. The work on 'Banks and Banking' by Mr. Morse has doubtless afforded many suggestions to the author. Mr. Morse's work is often cited as an authority in the courts, and has been mentioned with approval in several judicial decisions. Although not of equal merit with the foregoing, another compilation of the National Banking Law has been made by Mr. Ball of Chicago. These compilations and studies of the National Bank Law and its judicial meaning represent an immense amount of preliminary labor in clearing the ground and collecting material, that nullifies the apparent claim of Mr. Bolles to the credit of original investigation.

Similarly, the facts in regard to the relations between the Government and the banks, and the official application of the law, had previously been collected in a number of publications—banking periodicals and books of instructions to national banks. The report of the Comptroller of the Currency for 1878 contained a carefully drawn "summary of the principal requirements and restrictions of the National Bank Act," of nine pages, from an official standpoint, which to-day remains without material change the guide of the Comptroller's office. This summary was reprinted by that office in 1883-84 as part of a little volume of 'Instructions for the Organization and Management of National Banks.' This material is printed entire in the 'National Bank Act and its Judicial Meaning,' without a suggestion of credit or a quotation mark to indicate its origin. Mr. Bolles is not the only one who has treated Government publications in this way. Many book-makers seem to consider them common plunder, and use them without acknowledgment. The Government does not suffer by this. It is rather an advantage to have public documents quoted and intelligently commented upon. The ensuing evil is the lowering of the dignity of authorship and the confounding of all literary morality.

TOLSTOI AND KOROLENKO.

A Russian Proprietor, and Other Stories. By Count Lyof N. Tolstoi. Translated from the Russian by Nathan Haskell Dole. Thomas Y. Crowell & Co.

What to Do? Thoughts Evoked by the Census of Moscow. By Count Lyof N. Tolstoi. Translated from the Russian by Isabel F. Hapgood. Thomas Y. Crowell & Co. 1887.

What People Live By. By Count Leo Tolstoi. Translated by Mrs. Aline Delano. Boston: D. Lothrop & Co.

In Pursuit of Happiness. By Count Leo Tolstoi. Translated from the Russian by Mrs. Aline Delano. Boston: D. Lothrop Co.

The Vagrant, and Other Tales. By Vladímir Korolénko. Translated from the Russian by Mrs. Aline Delano. Thomas Y. Crowell & Co.

In the *Nineteenth Century* of April, 1879, Mr. Ralston, speaking of Tolstoi's 'War and Peace' and 'Anna Karénina,' said: "Neither of these works seems likely to be translated into English." A few months ago we were told in a public print by a New York publisher that "few translations are read, and Russian translations least of all"; and that "one translation in a hundred does pay." And now we have in English nearly all of the twelve octavo volumes of Tolstoi's Russian, to say nothing of other works from the same language. Thanks to translators and publishers for their unrequited enterprise! But, in reality, Russian translations are much read—if not by the million, yet by the thousands who demand things not only new but good. We know of a quasi-public library where recently an applicant found that but one volume of Tolstoi's works was at his service, out of twenty volumes belonging to the library.

The first book on our list contains seven stories: "A Russian Proprietor," "Lucerne," "Recollections of a Scorer," "Albert," "Two Hussars," "Three Deaths," and "A Prisoner in the Caucasus." The first six were written between 1852 and 1859; the seventh is one of the 'Tales for Children,' written between 1869 and 1872. The latter, perhaps because the latest, is by far the pleasantest story. The "Recollections of a Scorer [billiard marker]" and the "Two Hussars" are not pleasant reading. A skilful hand has sketched scenes in the life of the gambler and of the trooper—has filled in, rather, with realistic fidelity, the dark lines of their heartlessness and dissipation, which show the blacker for the few gleams of innocence and manliness that appear. These two tales seem to be told for the sake of the telling; the others, more or less, for their implied moral—implied, but in Tolstoi's writings never expressed. "A Russian Proprietor" (which in the original is called "The Landlord's Morning: a fragment from an unfinished novel, 'A Russian Landlord' [lord of the manor]") describes the Sunday morning experiences of Prince Nekhliudoff while visiting some of his peasants. (This name, it may be noticed, appears also in Tolstoi's 'Childhood, Boyhood, Youth.') The Prince had at the age of nineteen left his university course unfinished, with the purpose of carrying out immediately his new-formed plans for the improvement of his estate, and especially of the condition of his peasants. In this effort more than a year had passed when, on "a clear July Sunday, having finished his coffee and run through a chapter of 'Maison Rustique,' [he] put his notebook in [his] pocket, . . . and started out of doors." Guided by his notebook, he makes his round of visits, but meets discouragement on every side. Anxious to help his people, at whatever cost to himself, he finds them unready, unwilling. One couple will not leave their tumble-down hovel for a new stone cottage that he offers them. On his way home he says to himself: "My aunt was right when she wrote that it is easier to find happiness than to give it to others. Have my peasants become any richer? Have they learned anything? Or have they shown any moral improvement? Not the least. They are no better off, but it grows harder and harder every day for me."

'Lucerne; from the Recollections of Prince Nekhliudoff' has for its text this paragraph, printed in italics near the end of the story:

"On the 19th of July, 1857, before the

Schweitzerhof Hotel, in which there were lodging very opulent people, a wandering beggar minstrel sang for half an hour his songs, and played his guitar. About a hundred people listened to him. The minstrel thrice asked you all to give him something. No one person gave him a thing, and many made sport of him."

After which the writer says: "This is not an invention, but an actual fact." Nekhliudoff describes the really charming music of the Tyrolese; and tells how, after the crowd had sent him off with jeers, he himself followed and brought him back to the hotel, and ordered "champagne, and your very best." Both were treated with scorn, not only by an English lord and his lady, who were in the dining-room, but even by the servants. "I treated the little man exactly like an equal before all that audience of servants; and then, with all the respect I was able to express in my behavior, I took off my hat and pressed his hand with its dry and hardened fingers."

"Albert" is another story of a musician, a talented violinist, who is very weak morally (though not immoral) and very shabby. We are told how a kind-hearted bachelor took him to his own rooms and, with the aid of his servant, tried to make him better. The "Three Deaths" are those of a selfish, querulous "lady"; of a peasant coachman, who just before his death gives another coachman his boots; and of the ash-tree that the latter cuts down to make a cross for the other's grave. Before leaving this volume we ought to mark, for correction, a puzzling error of the proof reader. On page 4 is this: "Ambition is a virtue at your age, and with your means it becomes a fault and an absurdity when a man is no longer in the condition to satisfy this passion." After the word "means" a semi-colon and the word *but* have dropped out.

The next three books on our list are all from the last volume of Tolstoi's works, and belong respectively to the dates 1882–85, 1881, and 1885–86. The title 'What to Do' is from the French translation, the original titles being given in the "Contents" of the volume, namely: "Article on the census in Moscow," "Thoughts evoked by the census of Moscow," "On the significance of science and art," "On labor and luxury," and "To women." It would be superfluous to attempt a description, since the translator has herself given an excellent analysis of the volume in the *Atlantic Monthly* for July, 1887, under the title "Count Tolstoi and the Public Censor." We quote the last sentence of "To women": "Yes, ye women and mothers, in your hands, more than in those of all others, lies the salvation of the world!"

The tale 'What People Live By,' says a recent Russian writer upon Tolstoi, teaches forcibly the lesson of brotherly love "to the old and the young, to the cultured man and the plebeian, to the happy and the unhappy." It and the first of the next volume are told of shoemakers; and it is well known that our author is an active member of that guild.

'In Pursuit of Happiness'—there is in the original no title corresponding to this—contains four tales: "Where there is love there is God," "How much land a man needs," "The two pilgrims," and "Illyás." They belong to the class of which the critic above quoted says: "Concerning all these writings for the common people it may be said, that Count Tolstoi has succeeded better than all Russian writers in solving the difficult problem of a popular literature." In proof, he gives the results of an investigation made in the women's section of the Petersburg prison (formerly the Lithuanian Castle). "All Tolstoi's tales are listened to by the inmates, lettered and unlettered, with great interest, and some with real enthusiasm." Notwithstanding the scantiness of their daily wages (from 7 to 12 copecks, of which they have control of but one-half), they urgently insist upon buying these tracts with their own money. They carry them away into exile or to their village homes, in order there still to treasure them or to give them to others. We may remark here that the author takes no copyright for these tracts; any one may print them, and they may be bought for 5 copecks (about 2 cents), or less, apiece. 'What People Live By' and two in Mrs. Delano's other volume are accompanied by good copies of illustrations made for Russian readers, and these add much to the interest of the tales. But we are sorry for the omission of the New Testament texts that introduce two of the tales. It is said that Tolstoi's literary friends urge him to cease writing tracts for the people and essays in sociology and religion, and to give himself again to the production of works of art like 'Anna Karénina.' Mr. Kennan reports him as speaking "slightingly, almost contemptuously, of his works of fiction." In this he is as clearly wrong as he may be right in taking to tract-writing. Only the future can show.

The author of 'The Vagrant and Other Tales,' we learn from the "Biographical Note," is a young writer, his first sketches having appeared in 1879. The tales in this volume, with two exceptions, are told of Siberian life, or of vagrants (escaped or escaping prisoners). Want of space forbids a detailed account. Suffice it to say that the volume is exceedingly interesting both in matter and in manner. The translator deserves the thanks of every reader for marking the accents of all Russian proper names. And we must put on record to her credit the fact that she did *not* write the note on page 78, which mistakenly speaks of "the Yakúts or inhabitants of Yakútsk"; the Yakúts being one of several races inhabiting the district whose capital is Yakútsk. The editor or proof-reader, in his anxiety to distinguish the author's notes, appended to all others the abbreviation "Tr."

The work of the translators of the volumes under notice is, with some qualification, most praiseworthy. Mr. Dole sometimes misses the meaning, and sometimes obscures it, as though not quite sure whether the point be this or that. When he gets the meaning—which is usually—it is well expressed, with words well chosen. In the matter of the exact and full apprehension of the sense, both Americans stand at a disadvantage in comparison with Mrs. Delano, who, as the publishers' advertisement informs us, is "a cultivated Russian lady living in Boston"; while she, again, has had so much experience with our language that not an idiomatic fault appears, and her work is very smooth. It would of course be a truism to remark that, in translating, not only the sense but also the style should be reproduced as far as possible. In the case of Russian the difficulties are probably as great as in any other language that can be named. But, with all due respect for the opinion of others, we think this object may be more nearly attained by a somewhat closer literalness, a less frequent resort to circumlocution and to the combination of two or three sentences into one. As a simple example, chosen at random, take the title of one of the tales: "Where there is love there is God." A literal rendering would, we think, give both more grace and greater strength: "Where love [is], there [is] also God."

MARTINEAU'S STUDY OF RELIGION.

A Study of Religion. By James Martineau, D.D., LL.D. 2 vols., 8vo. Oxford: The Clarendon Press; New York: Macmillan & Co. 1888.

The distinguished "Principal of Manchester New College, London," was educated when Paley and the Bridgewater school were in the ascendant, and their influence is traceable in all that he has ever said upon the affiliated problems of philosophy and theology. He has an unmistakable flavor of conservative sympathies, although not wanting in appreciation for the changes made during his lifetime. A Nonconformist and Unitarian by training and education, if not by birth, we should have expected that freedom from the trammels of traditional views which would insure less recalcitration against the revolutionary effects of progress. Two generations ago he would have been viewed with suspicion, because his resistance to the assumptions of orthodoxy implied logical consequences of the most reprehensible kind. But intellectual development is not always in the direction anticipated by alarmists. Fear and prophecy are not infallible guides. For Dr. Martineau has not kept pace with the tendencies to agnosticism charged to the spirit of rationalism. He appears now to many as a conservative of the conservatives. He is an irreconcilable in regard to evolution, and his previous work on ethics marks close affinities with the theonomic views of Martensen. He is not, however, behind the most advanced discoveries of science; nor is he wanting in the peculiar endowments of the philosopher, that comprehensive range of abilities which extend, like the mind of Leibnitz, with almost equal freedom and ease over all the possibilities of knowledge. Perhaps no Englishman except Herbert Spencer can compare with him equally in this respect. Others may be greater in single fields, but they will be less able to command with his logical and literary power the resources of physics, mathematics, natural history, ancient and modern philosophy, psychology, and theology for a comprehensive survey of all phenomena; or to use so forcibly against opponents the weapons of scepticism.

Nevertheless, after every tribute of praise has been ungrudgingly bestowed, there remains a firm suspicion that any conversion which might accrue to his masterly argument and exposition will only be temporary, and that the next reading of a scientific book will inevitably shunt us off into the fatal vortex of unbelief. The reason for this is a fact which our author, and writers of that school generally, have failed to remark with sufficient clearness. It is the universal demand of science that we put general theories and statements to the test of actual experience. Thus, if we assert the "goodness" of God and also his creation and government of the world, science merely requires that we see whether its administration conforms to our idea of goodness. If God is said to answer prayer, science would test this belief by the same method which it employs to estimate the claims for "thought transference." We shall not decide which is right; we are only indicating a tendency.

The present volumes have been awaited with considerable interest by students and scholars. They are the sequel to the 'Types of Ethical Theory,' which appeared about three years ago. It is an important and significant fact that the author conditions religion upon ethical postulates—a position the very reverse of theonomic systems current in the past, and one which seems to contradict his theory of duty laid down in his 'Types.' There he had traced the

source of obligation in the last analysis to the authority of the Divine will. It was for this that Prof. Sidgwick took him so severely to task, and made his objections so cogent that most writers have acquiesced in their effectiveness. But here ethics are made the condition of theism, and we are left to conjecture in what sense they are so. We suspect, however, that the author is not aware of the full extent of his concession. It is one that certainly accords with the present necessity of reconstructing ethics upon a more assured basis than the changing fortunes of theological speculation. But to reverse the commonly accepted order of dependence will raise the question whether, after all, theistic beliefs have the importance we have attached to them. They may still seem to Dr. Martineau to have it; but he may be unconscious of retaining a reverence for beliefs which came to him from the theological view, and remain by association after he has completely reversed the relation of their connection and dependence. Of course, his defence will be the distinction between the *ratio essendi* of ethical and the *ratio cognoscendi* of theistic conceptions. But after we have conceded a prior importance to the gnosiological, we must apprehend a diminished interest in the ontological problem.

The extent to which the discussion represents the title will depend upon the view we take of "religion." Those whose conceptions of it are determined more by its cult than its creed, more by its forms of worship than its speculative doctrines, will find little to their taste here. Educated Unitarians, to whom the subject is mostly a philosophy, can accept it as a "Study of Religion"; but readers generally must resort to it for metaphysics and not for piety. The definition of "religion" is clear and admissible, and most conservative minds will find the author's emotional sympathies all enlisted in favor of the highest objects of reverence and hope. His philosophy is tempered by the emotional experience of a regenerated humanity, seeking a higher than itself; and, as expounded, comprehends a wider range of mental culture than the colder intellectual tastes of Unitarians usually allot to it. There is no display of intellectual pride at the achievements of liberalism, and none of the spiritual self-gratulation which led even Theodore Parker to say of his own sect, that "they were the most self-complacent people that ever took ship for the kingdom." But still, the spirit of rationalism which more intelligent students will be able to remark in every fibre of its structure, reveals no attachments to that view of religion which makes a fetish of a book, or shows an enthusiasm for surplices and rituals. It is on this account that many will see in it a suppressed tendency towards that position which can only be regarded as the last refuge of retreating thought.

There are four topics discussed, namely, "The Limits of Human Intelligence," "Theism," "Review of Opposing Systems," and "The Life to Come." Throughout the work, philosophic readers will be pleased to find what they missed in the 'Types of Ethical Theory,' namely, discussions of Kantian psychology and ethics, the former in the first, and the latter in the third topic. Most of us have been curious to know what the author would say about Kant, although tolerably able to guess from incidental sources the general direction which his exposition and criticism would take. But we cannot say that he has been happy in his efforts. It is too evident that he has not emancipated himself from the method of Locke and the principles of the "common-sense" school. Indeed, he seems not to have appreciated profoundly the problems raised by the philosophy of Locke, Berkeley, and Hume, and hence misses entirely the true position from which to estimate the great Königsberger. He is everywhere too sensitive about the relativity of knowledge, fearing that the least concession to that doctrine must land him in agnosticism, for which he has an antipathy much like that of Cato against Carthage. Of the discussions in particular we need only notice those on "teleology" and "the life to come."

Prof. Huxley at first thought evolution fatal to teleology, but later confessed his error. The chief difficulty, however, which it raises, Dr. Martineau does not seem to realize. It is not because evolution is a disguised form of chance, as the author imagines, that it seems so fatal to teleology, which implies ethical as well as intellectual attributes, but because its administration in accordance with the right of the strong is inconsistent with our highest ideas of intelligence and goodness. Thus it shows that the strong survive and the weak perish in "the struggle for existence." It is a reduction of the phenomena of nature to a formula in mechanics, where the resultant invariably accords with the superiority of physical force and prohibits all other interference. Now, "the survival of the fittest" so far explains the existence and improvement of organic structures that its most apparent implication indicates a course of things which seems to our minds a limitation of all ability to make it otherwise. The supernatural is subordinated and restricted, if it exist at all. Thus the Divine Being must either be limited in his power, or be identical with physical force. In the former case he is finite, in the latter he is not moral.

The discussion of anthropomorphism is judicious and able, but mostly a refutation of sceptical accusations. The complete confusion to which the author reduces Prof. Tyndall, and such as he, will be appreciated by all lovers of logic, whatever their sympathies. But, although one's argument for intelligence in the "world ground" may be conclusive, the crucial question is: "What relation does it sustain to man?" Does it accord with our ideals and aims, and if not, what qualifications must be added in order to call it intelligence at all? If it is not regardful of human interests, there is a diminished importance in defending its existence. We are in the position of Epicurus, who admitted the existence of the gods, but denied their participation in the affairs of the world. In such a case, theism might be admitted and still derive no value for regulating either conduct or belief.

The reply to the "alleged blemishes in nature" is exposed to a like criticism. While it serves as a most admirable check upon scientific dogmatism, it nevertheless attains its end only by admitting in reality the whole accusation of the sceptic, as the following passage will show:

> "The field-mouse, stealing through the grass in the safe darkness, catches the night-eye of the owl, and is devoured. In all such cases there is undoubtedly a sacrifice of single organisms without realizing their capabilities; and if it were the end of Nature (as it is ours) to preserve each of her offspring to full development, this would constitute failure. But so long as the life that drops into her bosom reappears in new births, nothing is really lost, and her purpose is untouched by mere change of instances. The teleology of nature must be sought, not in individuals, but in kinds."

Now, it is precisely the sacrifice of the individual that the sceptic has to complain of, and it is no refutation of him to point to the general good of the type. Besides, this view has dangerous and unwelcome consequences for another doctrine, as we shall see below.

The point of departure in discussing "the life to come" is enforced by an incident from the life of Schleiermacher, which is designed to show the incurable weakness of pantheism—namely, its affinities with the doctrine of Nirvana. From this, along with other considerations of philosophic import, Dr. Martineau would have us conclude to a personal existence beyond the grave as the only condition which will satisfy the demands of human nature. But if we can rescue the divine benevolence only by showing its exertion in behalf of the race, and not of the individual, can we invoke it when desiring to defend personal immortality against the claims of pantheism? The difficulty here is the old one, and it still remains unsolved. It is the conflict between philosophic tendencies in one direction and human interests in another. Their reconciliation remains for the future.

Robert Southey. The Story of his Life Written in his Letters. Edited by John Dennis. Boston: D. Lothrop Co.

THIS compilation from Southey's correspondence, with an introduction and some biographical notes to connect the letters, is as successful as was to be looked for. The selection is on the whole judicious, and shows the course of Southey's career in its successive periods, with his temperament and circumstances during each; the character of that long labor of his life; his confidence, as yet unjustified, in the immortality of his poems; and his manly constancy and Christian faith under the hard requirements of a bread-winning life and the repeated strokes of misfortune in the loss of children and wife. It was an original, but infelicitous, thought of Southey's to extend the ballad into an epic form, but in spite of having pleased many men worth pleasing, from Sir Walter Scott to Dean Stanley, and even such a poet as Shelley, the whole fleet of Madoc, Kehama, and Roderick have gone down like so many Spanish galleons of the old time, and the ballad has come back to us again with Sir Richard Grenville in its true immortality. It is not likely that the future inhabitants of Brazil will look back to the writer of their early history in the way that he fondly hoped—"No, Chauncey Townshend, it is not all; and I should deal insincerely with you if I did not add that ages hence it will be found among their works which are not destined to perish, and secure for me a remembrance in other countries as well as in my own; that it will be read in the heart of S. America, and communicate to the Brazilians, when they shall have become a powerful nation, much of their own history which would otherwise have perished, and be to them what the work of Herodotus is to Europe." The parallel has not yet been made, save by himself; but the Life of Nelson is still a good narrative, and outlasts everything else from his pen. When that shall have been condensed, and has passed into the British Plutarch, then will still be left the memory of a name which has been honored more than any other of his contemporaries for sterling virtues, as the old phrase went, and as an example of fortitude, labor, and common manhood. It was the perception of this moral strength that made Sir Henry Taylor affirm that it might be said of him "justly, and with no straining of the truth, that of all his contemporaries he was the greatest man"; and, without endorsing the form of the expression, we may acknowledge the truth that it conveys. Letters, however, are an incomplete expression of such a charac-

ter, and yet they have the advantage of making the reader more intimate with Southey than does formal biography. The great fault of the book is the lack of an index, which might have been easily made.

Classic German Course in English. By William Cleaver Wilkinson. Chautauqua Press. 1887.

We have here another popular book consisting of biographical sketches of the principal classical authors of Germany, with illustrative specimens of their works in English translations. Such books have now come to be rather numerous, and Mr. Wilkinson naturally feels himself called upon to explain wherein his volume differs from preceding ones of the same general kind. He accordingly states that his book is, in the first place, smaller than the others. Secondly, it is "not merely or chiefly historical and critical," but is "historical and critical incidentally." Finally, it does not "present long translated extracts in bare unbroken bulk," but does "present considerable extracts, interrupted, connected, elucidated, and appreciated by means of quasi-editorial comment in explanation and appraisal." "In other words," continues our author, "taking translated German text, select and representative, for the basis, the backbone, of the book, we shall seek so to edit the text as to invest it with flesh, its own flesh, to inspire it with breath, its own breath, to give it a heart, its own heart; in short, to make it live, and with its own life, to our readers."

Not a bad programme, certainly. We may add that the book is written from the point of view of evangelical orthodoxy, and that it is, we suppose, intended for use in the Chautauqua classes. The passages translated strike us as in the main well chosen, although many of them have often done duty as illustrative specimens before. The translations are taken from various sources, the author only now and then giving a version of his own. As to the quality of the "criticism, elucidation, and appraisal" which Mr. Wilkinson gives us, we were quite prepared for his statement that the selection, translation, and condensation of the illustrative passages cost him more labor and thought than the writing of the original text. In dealing with Luther, Klopstock, Gerhardt, and other pious writers, our author is sympathetic, and a trustworthy "guide" for those who need such guidance; but in speaking of Lessing, Herder, Wieland, and Heine, he shows his limitations. The essay upon Goethe, for example, is one long misrepresentation. It consists of statements, not usually quite devoid of foundation, but so connected and construed and with necessary qualifications so skilfully omitted, as to give a total impression which is radically wrong. As to the author's literary judgments, we quote a sentence or two: "In 1826 Heine had published the first instalment of his masterpiece, the 'Pictures of Travel'; what has there been in German literature since?" "'Faust' is dull reading, very dull reading, to the average English speaker." "We shall not conceal our own confident opinion that the time will come when men will wonder that ever such a heterolite production imposed itself on several generations of readers, or rather of critics, as a true triumph of genius and art."

The Bastille. By Capt. the Hon. D. Bingham. 2 vols. Scribner & Welford. 1888.

We do not think we can better describe the work of "Captain the Hon. D. Bingham" than by likening it to that of the organ-grinder. Every writer on history who is worth listening to combines natural and acquired qualifications. We do not, in all cases, expect or desire the wild violin-improvisation of Carlyle, or the showy though careless brilliancy of Macaulay, or the correct and conscientious but dull and mechanical proficiency of Freeman, or the degradation of the music to mere accompaniment to a political ditty, which is charged against Taine and Treitschke; but one does demand some scholarship and individuality of mind—not mere crank-turning. Yet this is all that is accomplished by the Hon. Mr. Bingham. Given a subject like the Bastille, and the only limit to the amount of matter, relevant and irrelevant, which one may write thereon, is the publisher's estimate of the cost of manufacture. But even in works of this class there is a difference of quality, to the degree that want of originality may largely be atoned for by grace of style. But Mr. Bingham's style is utterly without vigor or euphony, and is so careless that he ignores the difference between "who" and "whom." There is nothing to say about the topics treated. A popular history of the Bastille is necessarily an anecdotic history of France for four centuries, and this differs from other works of the kind only in being less attractive. Those who have no other means of informing themselves about the League, the Fronde, Mazarin, Richelieu, and the Iron Mask—not to mention two or three hundred less conspicuous characters and incidents—may find the book worth examination. As in all British histories, the print is excellent. The illustrations, on the other hand, are shabby.

The Theory and Practice of Archery. By the late Horace Ford, champion archer of England for the years 1850 to 1859 and 1867. New edition, thoroughly revised and rewritten, by W. Butt, M.A., for many years Hon. Secretary of the Royal Toxophilite Society. Longmans, Green & Co. 1887.

We can recommend this book as a thoroughly comprehensive work on practical archery. It will be especially valuable to those who take more than a superficial interest in the subject, and to whom the ordinary manuals are by no means satisfactory. Mr. Ford was the founder of modern scientific archery, and his best scores, whether at public matches or made in private practice, have never been surpassed. We feel sure that those who have some experience in archery, and who are fortunate enough to obtain a copy of this book, will feel renewed enthusiasm for the pastime, and will find a marked improvement in their scores after a careful study of it. The chapter on aiming is of special interest, as Mr. Ford's experience proved that an arrow drawn directly beneath the aiming eye was more certain in its flight than one drawn to the ear according to tradition, and his unusual success was greatly due to this fact. The last part of the book contains the records of public matches in England, and also gives some remarkable scores made in private practice. These are naturally most interesting and useful to those anxious to improve and to have some standard of excellence. Altogether, the work deserves to be owned by every one who practises archery. It will, we feel sure, meet a long-felt want.

BOOKS OF THE WEEK.

Alden's Manifold Cyclopædia of Knowledge and Language. Vol. I. A to America. John B. Alden. 50 cents.
Alexander, Mrs. A Life Interest. Henry Holt & Co. $1.
American Almanac for 1888. Am. News Co.
American and English Yachts. Chas. Scribner's Sons.
Annual Index to Periodicals, for 1887. Bangor, Me.: W. M. Griswold.
Ashton, J. A Century of Ballads. Boston: Houghton, Mifflin & Co. $7.50.
Barnard, F. P. Strongbow's Conquest of Ireland. London: David Nutt; New York: G. P. Putnam's Sons.
Becker, K. F. Friedrich der Grosse. Oxford: Clarendon Press; New York: Macmillan & Co. 90 cents.
Besant, W. Herr Paulus: His Rise, his Greatness, and his Fall. Harper & Bros. 35 cents.
Bigelow, J. Complete Works of Benjamin Franklin. Vol. VI. G. P. Putnam's Sons. $5.
Bradley, H. Story of the Goths. G. P. Putnam's Sons. $1.50.
Burnett, Mrs. F. H. Sara Crewe. Chas. Scribner's Sons.
Cary, Rosa N. Only the Governess. Philadelphia: J. B. Lippincott Co. 25 cents.
Cassell's Complete Pocket-Guide to Europe. New ed. Cassell & Co. $1.50.
Chadwick, Rev. G. A. Gospel according to St. Mark. A. C. Armstrong & Son. $1.50.
Clayton, G. Pleasant Waters: A Story of Southern Life and Character. Philadelphia: J. B. Lippincott Co.
Clodd, E. The Story of Creation: a Plain Account of Evolution. Longmans, Green & Co. $1.75.
Colton, G. Q. Shakspere and the Bible. Parallel Passages. Thos. R. Knox & Co.
Comenius, J. A. Orbis Pictus. Syracuse, N. Y.: C. W. Bardeen. $3.
Cook, W. W. Trusts: the Recent Combinations in Trade. L. K. Strouse & Co. 25 cents.
Cushing, W. Initials and Pseudonyms. 2d Series. T. Y. Crowell & Co. $3.
Darnell, H. F. Philip Hazelbrook; or, The Junior Curate. Buffalo: C. L. Sherrill & Co.
Dulac, G. Before the Dawn: a Story of Paris and the Jacquerie. G. P. Putnam's Sons. $1.50.
Emerson, J. M. Stimulants. Dick & Fitzgerald. 50 cents.
Forbes, G. Lectures on Electricity. Longmans, Green & Co. $1.50.
Goldsmith, O. The Traveller, and Deserted Village. Macmillan & Co. 50 cents.
Goldsmith, O. The Vicar of Wakefield. G. P. Putnam's Sons. $1.
Hawthorne, J. David Poindexter's Disappearance, and Other Tales. D. Appleton & Co. 50 cents.
Hawthorne, J. Section 558, or the Fatal Letter. Cassell & Co. $1.
King, Harriet E. H. The Disciples. 9th ed. A. D. F. Randolph & Co. $1.50.
Koopman, H. L. Orestes, and Other Poems. Buffalo: Moulton, Wenborne & Co. $1.
Lewis, Rev. A. H. Critical History of Sunday Legislation (321—1888). D. Appleton & Co.
Life of P. T. Barnum Written by Himself. Brought up to 1888. Bridgeport, Conn.: H. E. Bowser. 60 cents.
MacLeod, A. C. Love the Fulfilling of the Law. Extracts from the Writings and MSS. of the late Norman MacLeod, D.D. A. D. F. Randolph & Co. $1.75.
McCosh, Rev. J. The Religious Aspect of Evolution. G. P. Putnam's Sons.
Mercier C. The Nervous System and the Mind. Macmillan & Co. $4.
Meyer, Prof. L. Modern Theories of Chemistry. Longmans, Green & Co. $5.50.
Moore, Miss N. Pilgrims and Puritans: The Story of the Planting of Plymouth and Boston. Boston: Ginn & Co. 85 cents.
Murray, W. H. H. The Doom of Mamelons. Philadelphia: Hubbard Bros.
Newell, C. M. The Voyage of the Fleetwing. Boston: De Wolfe, Fiske & Co. $1.50.
O'Rell, Max. John Bull, jr., or French as She is Traduced. Cassell & Co. $1.
Palmer, Mary T. The Doctor of Deane. Boston: D. Lothrop Co.
Pennell, J. and E. Our Sentimental Journey through France and Italy. Longmans, Green & Co. $1.75.
Proudhon, P. J. System of Economical Contradictions; or, the Philosophy of Misery. Vol. I. Boston: Benj. R. Tucker. $3.50.
Rambaud, Prof. A. Histoire de la Civilisation Contemporaine en France. Paris: Armand Colin & Cie.
Richter, Prof. V. von. Text-book of Inorganic Chemistry. 3d ed. Philadelphia: P. Blakiston, Son & Co.
Robinson, Rev. Chas. S. Laudes Domini. Abridged ed. The Century Co.
Ross, Rev. A. H. The Church-Kingdom; Lectures on Congregationalism. Boston: Congregational Sunday-School and Publishing Society. $2.50.
Russell, Irwin. Poems. The Century Co. $1.

"The 'Young Folks' Cyclopædia' should be in every juvenile library."—*From a Report of the Connecticut Board of Education.*

YOUNG FOLKS' CYCLOPÆDIA of { *Common Things...$2.50.* / *Persons and Places. $2.50*

HENRY HOLT & CO., Publishers, New York.

THE MOTHER'S REGISTER.

In any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Prof. J. B. Fonssagrives's 'Mother Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1.25 for two volumes. Address Publisher of the Nation.

The Nation.

NEW YORK, THURSDAY, MARCH 15, 1888.

The Week.

THE Senate on Thursday passed a new Dependent Pension Bill, in the precise form in which it was prepared by the Pension Committee of the Grand Army of the Republic, and accepted by the Pension Committee of the Senate. The bill was drawn by the Grand Army men expressly with a view to avoiding the objections urged by the President to the bill which he vetoed last year, chief of which was the fact that the language of the latter regarding "disability" was "so uncertain, and liable to such conflicting constructions, and subject to such unjust and mischievous application, as to alone furnish sufficient ground for disapproving the proposed legislation." The new bill does seem to meet this objection, inasmuch as it expressly provides that the disability which entitles men to pensions must be a disability "which *totally* incapacitates them for the performance of labor." Strong efforts were made by Mr. Plumb and other Republicans to strike out this word "totally," as a concession to the President's scruples which the Senate ought not to make, but the majority insisted upon finally passing the bill with this important qualification retained.

Unfortunately, there are other features of the bill which are not so clear as might be desired, and Senators themselves differed so much as to the construction of sundry clauses that the real scope of the measure must remain a matter of doubt. This uncertainty of mind is reflected in the vote. The yeas on the passage of the bill were 44 and the nays 16. Allowing for 10 Senators who were paired, 70 out of the 76 members of the Senate virtually declared their attitude, of whom 49 favored the measure and 21 opposed it. Of these, 36 were Republicans and 34 Democrats. All of the 36 Republicans favored the bill. Of the 34 Democrats 13 favored it and 21 opposed. The Republicans could have been counted upon to support any pension measure, however sweeping, while the Democrats would probably have been solid in opposing a bill which they considered as opening the door to a great and unwarrantable extension of the pension list. More than half of the Democrats evidently held to this view of the pending bill, but nearly half of them thought it so well guarded as to deserve their support. It is noteworthy that among these Southern Democrats in the affirmative were "Confederate brigadiers" like Hampton of South Carolina, George and Walthall of Mississippi, Kenna and Faulkner of West Virginia, a rebel "war Governor" like Brown of Georgia, and a Confederate legislator like Pugh of Alabama, to whom must be added that Republican "rebel," Riddleberger of Virginia.

The investigation of Trusts has been taken up at Washington city. This is the right place, because it is at Washington city that the Great Trust, viz., the Tariff, is under investigation. It is altogether proper and fitting that the little Trusts and the great one should be put alongside of each other. As we anticipated, one of the pleas for the little ones is that Trusts are necessary because wages are so much higher here than in Europe. Mr. Parsons, in behalf of the Sugar Trust, according to the *Herald's* report, said that "labor was paid two or three times as high here as in Europe." This is probably an erroneous report of what Mr. Parsons said, because there is no such disparity between the United States and England, which was the country under consideration. In order to find a place where such disparity exists, we must go to some country like Russia, where wages are so low, as compared with those of England, that protective tariffs are maintained to keep English goods out. It is a singular fact that low wages in England constitute the reason for protective tariffs in the United States, while high English wages are the reason for protective tariffs in France and Germany. But it is not at all singular that the wages argument should be harnessed into the service of the Trusts. Every reason that brings this argument into the service of the tariff fits equally the case of the Trust. A high price for the article sold enables the producer to pay high wages—*argal*, he pays high wages. Let the Trust investigation go on at Washington city, but not at Albany. Let the big Trust and the little ones stand side by side, and prove their absurdities by comparison with each other.

The Burlington Railroad has promptly initiated legal proceedings against the Wabash, under the Inter-State Commerce Act, for unlawful discrimination in refusing to take freight from the Burlington. The Wabash happens to be in the hands of a receiver, and is, therefore, subject to the peremptory orders of the United States Circuit Court. That the necessary orders will be given there can be no doubt, because, whatever a railroad superintendent like Mr. St. John of the Rock Island may do, no court can set the example of disregarding a law of Congress. The written refusal of Mr. St. John to obey the law ought to be the prelude to his dismissal from the service of his company. He says that his engineers refuse to haul Burlington cars, and that in his judgment it is better not to haul them than to have a strike on his road and put the people along his line to great inconvenience. The law makes Mr. St. John liable to a fine of $5,000 for each refusal to take freight when offered to him. We hope that the Burlington will make several tenders each day and prosecute every one of them vigorously, besides making claim for damages to the parties injured by the non-delivery of their goods. Of course the Brotherhood of Engineers have put it down in their note-books that the Rock Island Company is a soft concern, and a fit subject for future attack and spoliation.

The Hon. Mr. Plumb, a member of Congress from Illinois, has asked and obtained leave to print six pages in the *Congressional Record* to prove that the 4 per cent. Government bonds are redeemable at the present time at par, following up this thesis with a gallant attack on the present Administration for buying these bonds at a premium. Mr. Plumb's argument is of various kinds and degrees of absurdity, but the chief point is that the Public Credit Act of 1869, reenacted in the Revised Statutes in 1873, provided that the United States might redeem any of its bonds before maturity if United States notes (greenbacks) should then be convertible into coin at par at the option of the holder. What the act in question said was, that "none of the interest-bearing obligations, not already due, shall be redeemed or paid before maturity, unless at such time United States notes shall be convertible into coin at the option of the holder." It is easy to see that these two propositions—the one in the law and the one in Mr. Plumb's cranium—are identical, just as a horse chestnut is a chestnut horse.

Senator Cameron of Pennsylvania on Thursday presented eleven petitions of citizens of that State "praying that no reduction be made in the tariff duties or in the internal-revenue taxes." In other words, these conservative citizens petition Congress to collect from the people a hundred million dollars, more or less, every year, that the Government has no use for, and cannot get rid of in any honest way. The right of petition is sacred, and we would not have it curtailed. But the character of these petitions suggests the important query what mankind will do when, in the course of revolving ages, the United States Treasury shall have absorbed all the money in the world. As no period of time is mentioned when any taxes shall be repealed, it behooves us to devise some method of transacting business without money. Certain persons of a speculative turn of mind have now and then propounded the plan of trading by a "tabular standard of value." Perhaps Mr. Cameron's constituents have this plan in view, and are seeking to direct public attention to that reform by preventing us from having any old-fashioned money at all.

Mr. Sherman's bid for the anti-Chinese vote turns out to have been nothing but a piece of sharp practice. Finding that his record on the anti-Chinese bills of a few years ago rendered him unavailable as a Republican candidate on the Pacific Coast, he resolved to capture that part of the country by a great show of attention to its wishes now. So he introduced a resolution, and had it passed, asking the President to negotiate a new treaty regarding Chinese emigration. This would have been bad enough as a transpa-

rent piece of electioneering if the idea of such a treaty had really been original with him, and he had been sincere in his apparent effort to stir up the Administration to action. But it turns out that, as Chairman of the Committee on Foreign Relations, Mr. Sherman knew that the Administration had been for a long time engaged in efforts to secure such a treaty, and consequently that he was guilty of false pretences in trying to pose as the champion of the Pacific Coast. If the Ohio Senator has any friends, it is time for them to interfere, or the Presidential bee will soon make him a national laughing-stock.

Mr. Henry George, in the *Standard*, supplies an illustration of the wages fallacy by a discourse on the tariff on bottles. Some years ago Mr. Siemens, the German inventor, discovered a new process for making the cheaper kind of bottles whereby the cost was greatly reduced. He offered to sell the process to the bottle makers of the United States, but as it involved the destruction of the old process and the loss of the capital invested in it, they refused to buy it. Mr. Siemens then said that he should undersell them in the United States, because he could pay the duty and still sell cheaper than they could. They replied that they "would see about that." So they went to Congress and got the duty raised to 200 per cent. ad valorem, effectually checkmating Mr. Siemens's benevolent intentions. They then lowered the wages of their workmen, established a lockout, and at the end of a long struggle starved their operatives into a surrender. In this way the theory of high wages under a prohibitory tariff was vindicated in the bottle trade.

Ex-Gov. Bullock of Georgia, the last Republican Governor of that State, continues his good work of spiking the guns of those Northern Republicans who want to make a bloody-shirt campaign this year. As everybody knows, Georgia is the State most depended upon for figures by the Republican organs and stump-speakers which argue that there is not "a free ballot and a fair count," and that the Republican vote is suppressed, because few ballots are cast for Republican candidates. Ex-Gov. Bullock meets this charge fairly and squarely. He says: "The fact that the ten Congressmen from Georgia were elected by 26,000 votes, and without opposition, does not by any means prove that it was either a dishonest vote or an unfair count. It only proves that there was no issue about which our people contended, or upon which we differed among ourselves." He says that if the issue of protection or free trade can be made, "every man—white, black, and yellow—in Georgia will vote according to his convictions, and the votes will be counted as cast"; but that "if the question in issue is the supposed suppression of votes, no one will bother his head about it, for every one knows that it is a false issue, and one in which we take no interest."

When Mr. Sherman made his famous Nashville speech last year, he gave utterance to this most patriotic sentiment: "The war is over, thank God; but the courage, bravery, and fortitude of both sides are now the pride and heritage of us all." This tribute to the valor of "rebels" was no sooner published than "Bill" Chandler and others of the party Bourbons began denouncing Mr. Sherman, and he was forced to recant in his Springfield speech, wherein he denounced every "rebel" as unworthy to hold office. Happily Mr. Sherman could not wipe out the printed report of his Nashville speech, and we are very glad to note that the words which we have quoted have been selected by the surviving members of the Federal and Confederate divisions that participated in the charge of Pickett's corps at Gettysburg, and will be graven on the monument that these former enemies propose to erect on that memorable field near the so-called "Bloody Angle." It would have been much better for Mr. Sherman's reputation if he had told "Bill" Chandler and the rest of the Bourbons that he "would rather be right than be President," and that he would stand by his Nashville speech, for in that case he would certainly have been right and might have been President, whereas his recantation put it out of his power to be either.

The "crisis" is on again. This time it is in Augusta and Bangor, Me. A week ago Monday it was in Lewiston and other Maine cities, and in Des Moines, Iowa. A fortnight before it was in Syracuse, N. Y. From the point of view of common sense, the question in each city was simply whether one or another man should be Mayor, but in the politicians' view, the issue has been whether "free trade" should be endorsed, whether the city would "keep her place in the Republican line"; whether the voters should help to secure "a Republican State and a Republican President next fall." The result has varied greatly. Senator Hiscock appealed to Syracuse to "indicate the sturdiness of Republican politics in Central New York in this Presidential year," and the city went Democratic by almost 800 majority. The great Manley informed the world after the elections in Lewiston and other Maine cities, on Monday week, that "Maine repudiates the free-trade message"; but as Des Moines the same day elected a Democratic Mayor, it looked as though, by parity of reasoning, Iowa endorsed free trade. Of course no such issue was really involved in the elections anywhere; and after seeing the mixed character of the results, the politicians will probably be ready to admit that they have been talking nonsense.

There could be no better evidence of the growth of thrift in the South than the introduction of the cent. In the old days nobody bothered with so small a thing as a cent, and the nickel was the smallest change that passed current. Even to this day in Georgia the "rules governing the transportation of passengers" laid down by the State Railroad Commission provide that "when the passenger fare does not end in 5 or 0, the nearest sum so ending shall be the fare. For example, for 27 cents, collect 25 cents; for 28 cents, collect 30 cents." But the South has gradually discovered that it is not beneath its dignity to look after the pennies, and the Commission has just amended this rule by providing that railroad companies after May 1 shall collect the exact mileage if they can make the necessary change, and, in case they cannot, shall not collect more than the next lowest amount ending in 5 or 0. This, of course, makes it for the advantage of the railroad companies to lay in a supply of cents, so that they can make the exact change, and, once accustomed to the penny in paying railroad fare, the people will soon learn to insist upon it in all transactions. And they will find that it "will be money in their pockets."

Some curious results appear in statistics furnished by Mr. Harrison Branthwaite, keeper of a home for inebriates at Twickenham, England. Mr. Branthwaite's conclusion is that "drunkenness is a disease amenable, like other diseases, to careful treatment." No doubt his qualification, "like other diseases," is to be construed strictly; that is, there are many incurable cases. Still, out of fifty patients under treatment for an average period of about five months, only nine have "relapsed," while eleven have become total abstainers. In nineteen out of the fifty cases an hereditary disposition to drink existed. An analysis of causes shows a convivial disposition in fifteen cases, while forty-two were "social" in habit, only one being "morose" and one "gloomy"; "domestic worry" drove eleven to drink, and "business worry" was the cause of seven instances. Blaine editors should take notice that "election work" is responsible for one case out of fifty. A useful moral may be drawn from the statement that of the patients on Mr. Branthwaite's list twenty-three were given to "all kinds" of stimulants, while it includes only one addicted exclusively to wine, and one who indulged in beer solely.

It becomes more and more evident every day that the feature of Blaine's withdrawal which most worries the Blaine men is the fear that the Republican party may possibly nominate somebody for whom some Mugwump may vote. In the discussion of candidates, it is already made plain that a good word from a Mugwump in favor of any man is accounted sufficient reason for "straight Republicans" to drop him from consideration. Thus, the Cincinnati *Commercial Gazette* remarks that "the Mugwump and Cleveland papers in New York and Philadelphia are taking a good deal too much interest in Judge Gresham as a Republican candidate to commend him to Republicans. Able editors who did, or propose to, support Cleveland for the Presidency, should not imagine that they will be consulted about the Republican candidates." The best expression of this feeling which we have anywhere found appears in the Gloversville *Intelligencer*, a Republican organ published in Fulton Coun-

ty in this State. The *Intelligencer* explains that it mourns over Mr. Blaine's withdrawal in part because it had hoped to fight the next Presidential contest on that line, and because it believed that he would win by an overwhelming majority, but chiefly for another reason, which must be stated in its own words:

"But over and beyond these causes of sorrow there's one that sinks deep into our soul—that eats into our innermost heart and burns like the fires of sheol—and that is, that the withdrawal of Blaine from the contest may, and probably will, afford a pretext for George William Curtis, George Jones, and other nasty little Mugwumps to support the Republican ticket next fall."

This fear that objectionable people may vote your ticket is one of the most curious things ever known in the history of politics. How Abraham Lincoln would have laughed over the idea that the Republican party might get too many votes because some "nasty" people proposed to vote for it! However, it is of no use to laugh over the idea, for it is really a very serious matter to the people who entertain it. What must be done is to devise some means by which these objectionable voters may be kept from supporting the Republican ticket. The thorough-going Blaine men still insist that the only certain method is to nominate Blaine anyway. But it would be well to be prepared for all contingencies, and in case Blaine is not nominated, there must be some assurance that the man who is nominated will not get any more votes than Blaine would. How would it do to draw up a list of possible candidates any one of whom the "nasty little Mugwumps" would pledge themselves not to vote for, and any one of whom, therefore, would be eligible.

Massachusetts towns have the chance to vote on the question of licensing the sale of liquor every year, and the same swinging of the pendulum from one extreme to the other which occurs so regularly in the large cities is often noted in the smaller places. Of twenty-three towns in the western part of the State which voted last week six went for license which went against it last year, while two went against it now which went for it last year. The aggregate vote of all twenty-three towns showed 739 majority against license last year and 342 for license this year.

We presume Mayor Hewitt has done nothing to give more genuine pleasure to a large body of people than his blunt refusal to review the Irish procession on St. Patrick's Day. The courage of it is so novel that it both delights and amuses, in these days when politicians pass so much of their time looking around to find clubs, or societies, or brotherhoods before which to abase themselves. Moreover, the St. Patrick's procession has always been one of those mistaken modes of commending themselves to American admiration and good wishes into which the Irish are so apt to fall. As a procession it is never impressive, and, in fact, is apt to be a little ridiculous in American eyes. It costs a good deal of money to poor people, and it constitutes a most annoying interruption to traffic at a busy hour of the day. The pretence in which Mayors have always hitherto been in the habit of indulging (we believe Oakey Hall wore a green coat in honor of it), that they considered it something very fine, has been one of the most pitiful episodes in municipal politics, and Mr. Hewitt's refusal to continue the tradition is a good sign of the times. We say good sign of the times, because the attempts of associations and clubs of one sort or another to bully or cow public officials were never so numerous as at present.

Mr. Randall's Tariff Bill may be looked upon as the champion oddity of the session. It does not entirely repeal the liquor taxes, but it puts them in such shape that they might better be repealed. The discrimination between spirits used in the arts, and spirits used as a beverage, and between those distilled from grain and those distilled from fruits, could never be carried into effect on our widely extended and sparsely peopled territory. The duty on sugar is left absolutely untouched, and here Mr. Randall shows a more slavish devotion to the principles of protection than the Republicans. The bill sent to Washington by the Home Market Club of Boston cuts heavily into the sugar duties, and offers a compensating bounty to the planters. The remainder of Mr. Randall's bill is a readjustment of fractions among the protected classes, giving a little more to one and a little less to another, like the country described in one of Bastiat's parables, where the people had resolved that no industry could prosper unless highway robbery were legalized, the roads being apportioned between the different highwaymen, and reapportioned whenever it was found that one was getting more and another less than his fair share. The Republicans, we are convinced, will have nothing to do with Mr. Randall's bill; and since the Democrats will not touch it, the only thing to be done with it is to put it in a show-case and exhibit it as an oddity.

The meetings of Republican State Committees in the Southern States, which are now occurring, do not cut much figure in the despatches, but they well deserve attention. The local papers in the cities where the committees meet, occasionally contribute information of no little significance as to what is going on among the politicians. Thus, the Montgomery *Dispatch*, the Democratic paper published at the capital of Alabama, says that the Republican State Committee in that city last week rendered it evident that Blaine's friends still mean to push his claims and work for his nomination. The *Dispatch* draws this picture of the proceedings: "Money was used here during the meeting of the Committee in the interest of both Blaine and Sherman. Blaine had the biggest pile if not the best 'hand,' and raked in the 'pot.' When a prominent Republican who attended the meeting of the Committee as a spectator, and who is more truthful than discreet, remarked that it is not John Sherman's bloody-shirt record or Blaine's protective-tariff letter which is going to capture the Southern vote, but the *income* tax,' he uttered a vapid truism, and one which, it is quite evident, Steve Elkins appreciates, but of which Sherman's friends seem totally and wholly ignorant." The *Dispatch* concludes that the Montgomery proceedings are only part of a policy which is being carried out through the South, and expresses the opinion that Blaine is going to be nominated.

Without reference to the question of its bearing on the chances of rival candidates, the state of things which is illustrated by this Alabama incident contains much food for thought. The theory of a national convention is that representatives of a political party gather from all parts of the country to decide what man will make the strongest candidate for President. Under normal circumstances, there is a rude sort of equality and fairness in allowing each State a share in the Convention proportioned to the State's share of the total electoral vote for President. But what is known as the "Solid South" casts more than one-third of the electoral votes, and in only half-a-dozen of these sixteen old slave States is the Republican party at present a real political organization. In the other Southern States, the only semblance of an organization is the relic of the machine which was constructed by the Federal office-holders under Republican national administrations. Enough of these managers are left to "go through the motions" of holding conventions and electing delegates, but the delegates have no real constituency which has authorized them to speak for it. Yet Alabama will have more delegates in the Republican National Convention than New Jersey, and Mississippi more than Connecticut; and these delegates, who represent no constituencies, may force a candidate upon States like New Jersey and Connecticut.

Mr. Goschen's proposal to convert the national debt of Great Britain from 3 per cents into 2½ per cents is a very important, though not, as things go, an over-bold transaction. The 3 per cents are now quoted at 102⅜, and would be considerably higher if they were not menaced by the proposed funding scheme, which has been hanging over the market ever since they rose above par. Mr. Goschen's plan proposes that the interest of the new consols shall be 2¾ per cent. for fourteen years, and 2½ per cent. thereafter, effecting a saving to the Treasury of £1,400,000 per year immediately, and £2,800,000 after the expiration of the fourteen years. There is no reason why the plan should not be successfully carried out. The English fundholders have been protesting against it in a feeble and somewhat ludicrous way ever since the project took shape, five or six months ago, but their groans will not be listened to, and of course ought not to be.

THE EFFECT OF THE KAISER'S DEATH.

ALTHOUGH it has been for the last five years, at least, reasonable to expect the death of the German Emperor at any moment, it has had, nevertheless, as the disappearance of any great historic figure must have, the effect of a more or less painful surprise in all civilized countries. People are now asking, with as much anxiety as if he had died at the age of sixty or seventy instead of ninety-one, what is to happen next, how will the German Empire fare, and what will be the effect on the peace of Europe.

In trying to answer these questions, it is well to bear in mind that the Emperor's greatest feat of statecraft was the discovery, promotion, and steady support of Bismarck; and that whenever we examine closely any piece of his policy during the past twenty-five years, we find that its merit lay in a fixed, unswerving, unshakable determination that, through weal or woe, Bismarck should have his way. It is true that Bismarck could not have created the German Empire without having such a sovereign at his back, but it is true also, and in a larger sense, that King William would never have been Kaiser if he had not at the critical moment found a minister whose courage was equal to every occasion. The two men must have passed through awful moments of anxiety together, but Bismarck was probably truthful in claiming that at some of the most awful he had to supply for both the needful amount of unconquerable will; that, in fact, the King's prejudices were among the greatest obstacles he had to overcome in the earlier days of his Titanic task. We shall probably arrive at a clearer conception of the political importance of the Kaiser's death by asking ourselves whether it would at any time within the last twenty years have been possible to carry any measure, either of administration or legislation, in the German Empire without Bismarck's initiative or against his wish. The Minister has in truth been, and is now, the supreme ruler of the empire. He has not only crushed all opponents, but has silenced all critics. For a long time it has been impossible for any man to make a career in German politics who found fault with Bismarck's ways.

Consequently, the great crisis of the German Empire has not yet come, and will not come until Bismarck disappears from the scene. The notion that either the Crown Prince or his son, even if both were in the vigor of health, could get rid of the Prince or his policy, especially in the present state of Europe, is chimerical. Neither of them would probably even attempt such a feat. The fear that Prince William, if he now ascends the throne, can precipitate a quarrel with anybody, ignores the moral forces which, even in the most military of States, lie behind the fleets and armies, and must be controlled before the national strength can be put forth. To mobilize the German Army in a quarrel of which Bismarck did not approve, and which the nation would, therefore, think unnecessary, would be a task for which no sovereign would be equal, and least of all a young and sickly one. The most absolute monarchs in our day are but wheels in the immense social machine. The Czar, who is to outward appearance the only specimen of the old eighteenth-century sovereign left in Christendom, is said to be the least free, in his sphere, of all the Russians. His generals, his bureaucracy, and his revenue collectors surround him with walls of necessity against which he might beat his brains out.

The probabilities are, therefore, that the influence of the Kaiser's death on European politics will be imperceptible, tragic and impressive as the circumstances have made it. There are few more pathetic events in history than the transmission of the crown, in the order of nature, to the gallant soldier and honest gentleman lately thought to be dying by inches at San Remo. If a painter wished to illustrate the vanity of human wishes, to bring home to us with the pencil "what shadows we are and what shadows we pursue," he could hardly choose a better subject than the receipt by the Crown Prince of the news that he had inherited the greatest throne in the world. But this is, after all, the old tale of private sorrow and disappointment. The great crisis in German politics will not come until Prince Bismarck's death is announced. Then, indeed, the wisest man may well hold his breath; for even the warmest admirer of the Prince and of his work must admit that the one thing for which he has in his great career made no provision is a successor. Neither his policy nor his system of government is suited to a world in which the supply of Bismarcks runs short. When his tongue is silent and his busy brain has ceased to plot, and not until then, we shall know what he has done, if anything, to make his work enduring.

A GOOD FIELD FOR REFORM.

SOMETHING needs to be done, and done promptly, about the Indian service, and the only thing that can be done to secure reform is the extension to this service of the civil-service rules. The matter has more than once been laid before the President by the Indian Rights Association of Philadelphia. He has not questioned the accuracy of these reports, and he has acquiesced in the opinion expressed by Mr. Oberly that he has the power, under the law, to extend the operation of the rules to this service. Nevertheless, nothing has been done. All the recent accounts of the doings at the agencies go to show that the spoils system never flourished more vigorously anywhere than it flourishes there. Nevertheless, nowhere is it such a disgrace to the nation. The helplessness and ignorance of the Indians constitute the strongest possible claim on the Administration for care in the appointment of those who are to look after them. Political hacks are bad enough in the post-offices and custom-houses of white men, but in these places they are impositions on people who ought to be able to take care of themselves. Putting them in charge of the Indians is a fraud on the helpless and the poor.

The root of this trouble (and if the President does not know it, it is time he did) is that Mr. Atkins, although personally a most respectable man, is much too simple-minded and good-natured for his place. The real Indian Commissioner is not he, but Mr. Upshaw, his assistant. It is Upshaw who manages Indian affairs, and he manages them not for the benefit of the Indians, but for his own benefit and that of the "party." Nearly every appointment in the Indian service is made by him, or comes direct from him, and is turned to his account in some way. Under his system he manages to place Senators and Congressmen under personal obligations to him. We are informed that when he hears of their election he writes to them asking if they need anything in his line, or, in other words, whether they would like to plant a henchman in the Indian service. It must be said for him, however, that there is nothing partisan in his operations. He "tenders" his good offices to Democrats and Republicans alike, and he consequently has abundance of friends in both parties ready to certify in the hour of need that he is "one of the ablest executive officers in Washington." In short, he lives on terms of close intimacy with the mammon of unrighteousness. Now, it is time he was overhauled. If the President means to put an end to the great discredit the Indian service has been bringing upon his Administration, and destroy the ammunition it will furnish to his enemies next summer, he must begin with Upshaw. There can be no change for the better as long as there is a man in Upshaw's place more occupied with obliging Congressmen than taking proper care of the nation's wards, or a man in Mr. Atkins's place who is willing to let Upshaw have his way.

The effects of the Upshaw system began to show themselves as early as 1886. A good illustration of it was the removal of the farmer at the Cheyenne and Arapahoe Agency, in the summer of that year, to make way for an old gentleman who, by reason of age and permanent infirmity, was, Capt. Bell, the agent, reported, "not suited to discharge the duties of the position." The physician at the post declared him permanently disabled, and an Indian had to be employed to do his duty. Capt. Bell (U. S. A.) continues his report as follows (Sept. 7, 1886):

> "The uncertainty as to tenure of office existing in the minds of employees at this agency, due to the system adopted by the Department of appointing persons to fill various positions who are entirely devoid of experience in Indian affairs, is demoralizing and injurious to the service. Under the present system they feel, and properly so, that the faithful attention to duty, honesty, and efficiency counts for little, and that it is only a question of time when the Department will require their place for some one as a reward for political services. The chief herder, who has faithfully performed his duties at this agency for several years, has recently been removed to give place to the appointment of a young man from Tennessee, who has never had a day's experience in taking care of large herds of cattle on the plains in winter, and I imagine that his first experience with a Dakota blizzard will make him wish for the comforts

of his Tennessee home. The efficient issue clerk has also been removed and his place filled by the appointment, contrary to regulations, of a partner in one of the Indian trading establishments of this place, the removal and appointment having been made by an inspector of the Department, and during the absence of the agent. I have not heard of any charges having been made against either of the persons removed. Until honesty and faithful performance of duty are taken into account and made the basis of tenure of office, and until the Department and its management are entirely and absolutely divorced from politics, but little can be hoped for in the way of material progress.

"The policy now in vogue is degrading and demoralizing. The agent is but a figure-head, and is prevented by the interference of the Department from conducting the affairs of the agency according to commonsense business principles. It is impossible for an agent to maintain a manly sentiment of independence and self-respect, and remain voluntarily in the service; and nine-tenths of the agents, if they express their true sentiments, will endorse what I say. There can be but one head to an Indian agency, and the agent should be that head, if discipline, the mainspring of success, is to be maintained. If an agent is not capable of selecting the persons to serve under him, he is not a fit person for the place, and should be removed."

This report was made a year and a half ago. Things have not mended since then. They have grown worse. Such things always grow worse merely by continuing, like any sore, physical or moral. No bad man or bad practice maintains for any length of time the same degree of badness. Mr. J. B. Harrison, whose competence and high character as an observer are well known to readers of the *Nation*, visited the Indian Boarding School on the Yainax Reserve in southern Oregon in the summer of 1886. He found it in charge of Prof. Leeke, an admirable man whom any other civilized Government would think itself lucky to get in its service. When his term expired, Upshaw got rid of him promptly, probably to oblige his Congressmen. Prof. Painter, who visited the Territory last summer on behalf of the Indian Rights Association, found some Government boarding-schools in which as many as five successive superintendents had served in one year. The condition of some of the schools under Upshaw's men he reported as deplorable.

In fact, it is impossible to resist the conclusion that the Indian service has suffered as no other department of the Government has done from the change of administration in 1884. It has, as far as we can ascertain, all come from the fatal error of putting a weak man at the head of the Bureau, and giving him a smart, active, unscrupulous, and energetic politician to do his work for him. The President cannot have meant this, but he cannot afford to let it go on. Upshaw is too expensive a person for any administration to keep in the house. He cannot get votes out of the Indians, and he disgusts thousands of voters who wish well to President Cleveland's Administration, but to whom cruelty and jobbery and corruption are never so odious as when practised on those who cannot complain.

GRASS.

THE bill introduced in the Senate by Mr. Platt of Connecticut, providing for the establishment of an experimental grass and forage-plant farm, ought not to go without notice by those interested in the expenditure of Government money and those who care for agriculture. It provides for the purchase of a Government farm near the 100th meridian, presumably in western Kansas, or in Nebraska or Dakota, where "extended experiments are to be carried on," with a view to the economic worth and the culture of grasses and forage. In support of the project, attention is called to the value of our grass crop, which aggregates about one thousand millions a year. On the quality of our grasses depends that of our beef, mutton, pork, and whatever else comes of such nutriment. "All flesh is grass," cries the Senator—whether with enthusiasm or sadness we are not informed, though we understand the Scripture quotation to illustrate those remarkable coincidences between science and revelation which the last generation was fond of adducing.

We credit the Senator with a higher motive than the gratification of his own appetite. He desires to promote our agricultural interests. In directing attention to the worth of careful observations on grass culture, he has touched a matter of considerable importance. Whether the establishment of a Government farm may prove to be the wisest way to accomplish his purpose, is a question to be discussed after the desirability of some action has been admitted.

Mr. Platt informs us that the yearly cost of the seed and vegetable section of the Agricultural Bureau is $100,000. No suggestion is given as to the cost of the new project. The first outlay for the farm in the proposed region need not be large. But at its heels follows the need of buildings, tools, and scientific appliances on a scale commensurate with the dignity of a Government establishment for the conduct of "extensive experiments." To these must be added laborers, superintendents, and scientific investigators. The first cost will be small compared with maintenance through even a limited period of years. Annual expenses will not be diminished by the distance of the farm from the office at Washington. To say that the hundred thousand dollars per year now spent on seeds and vegetables would be matched by an equal sum for grasses and forage plants is probably not far from the truth. This would not be an unreasonable sum were the interests of science or practical agriculture to be most effectually furthered by the outlay. On this point we have serious doubt. We do not question that the Western plains, towards which the project partly looks, might, in the end, be helped by a scientific handling of the grasses native to them, and by a judicious selection of forage plants to supplement the grasses; though cultivation has not yet made such progress among the ranches as to suggest much immediate benefit. In so far as the plan contemplates a general investigation of the grasses of the country, the extreme West presents difficulties.

But objections are not urged on account of the proposed location. They arise from the limited benefit to be derived from a single Government farm in any locality. Government cannot establish one farm to conduct experiments which shall be of more than partial value to the whole country. When the people in Washington go into the business of scientific farming, they will find themselves in a very large business, which will require one farm for each important climatic division of the country, and perhaps another for every diversity of soil. Grasses and forage plants are dependent for profitable growth on soil, climate, and fertilizers. These last can be commanded by purchase anywhere. But soil and climate are uncontrollable. Although Mr. Platt states that but little attention has been paid to grasses by the Agricultural Department and by agriculturists generally (a statement which needs some further qualification), he seems aware that grasses, as well as fruits, are limited in their range by climate, those which grow in the colder and more moist Northern Atlantic States being impossible to the Southern States or to the great interior plains, though they may flourish again on the upper Pacific Coast. From this fact it follows that grasses which might flourish on a single Government farm could not, on that account, be recommended for cultivation in a region where the climatic conditions materially differ from those around the experiment station. Observations on the growth of grass and forage near Washington, for example, are well-nigh worthless to the farmer in Vermont, Michigan, Wisconsin, Texas, or Georgia. At the present moment our Southern States are making strenuous exertions to establish general farming in place of a too exclusive cotton, rice, and sugar culture. They may be thought to be in more pressing need of help in the matter of grasses and forage than is the extreme West; but experiments conducted in New England or on the Western plains would be of but the least service to the young dairy and beef interest those States are endeavoring to foster. These reflections repeat themselves almost word for word when we substitute the consideration of soil for that of climate. No one farm is likely to embrace a great variety of soils. The most that could be affirmed as the result of experiments conducted on clay land, for example, would be that a particular grass or fodder succeeded well or poorly on clay under the peculiar climatic conditions prevailing in the region, though the plant might reverse its behavior either in a different soil or in the same soil with a different degree of moisture or of heat.

We agree with Mr. Platt in his main purpose, but we think he overlooks difficulties that would occur to the scientific investigator and the practical farmer. The establishment of a large and expensive farm by the Government might be advocated and undertaken with gratifying éclat, but the money can be better expended. We speak for no institution, nor by reason of suggestion from any. Mr. Platt confesses that his attention was first called to this subject by the activity displayed in this department of research by one of our State agricultural experiment stations. It is surprising that he did not see how these State institutions,

widely scattered over the country, and equipped by men of a high order of scientific attainment, zealously prosecuting investigations in all directions, could be made available in coöperation with the department at Washington for a much wider inquiry into grasses and forage plants than would be possible to a single Government farm, or to several. These institutions were either called into being by the patronage of the central Government or have been endowed by the public treasury. They are fitted with appliances, and are accustomed to work with economy. A corps of professors and experts in Connecticut, Michigan, Missouri, Vermont, Georgia, or Texas, works under conditions of climate which apply to the surrounding country. Its experiments on grasses would have an immediate value for that region in which it operates. Such a corps can always, without purchase, command all varieties of soil on neighboring farms, and would find intelligent farmers willing to carry out each one an experiment on a crop under the direction of an expert. The labor and cost of visitation by the investigator would be slight, and most farmers would require but small assistance in money. If our Government is to expend a hundred thousand dollars per year, or a half or a quarter of that sum, let it appropriate for the next ten or twenty years a few hundred dollars annually to each of several judiciously selected experiment stations, for the specific purpose of aiding the Government to obtain the information needed. We do not want a Government farm in the far West, or in the East, or in the South. We need coöperation of the central Bureau with the State institutions, thus securing encouragement to these in conducting investigations which they have already begun, and would be glad to prosecute. The State stations would then stand, as they ought, in intimate relation with the Agricultural Department at Washington, collecting facts for classification and generalization, very much as the signal stations stand related to the Weather Bureau, except that the bond would be voluntary and unofficial. We hope Senator Platt may be induced to revise his plan so as to bring it into accord with economy and efficiency.

A CRANKY VIEW OF COPYRIGHT.

THERE is a fine specimen of confused thinking in an article against copyright in the last number of the *Christian Union* by the Rev. James M. Whiton. Here is one of the tidbits:

"Plainly, there is a fallacy in calling a poem or a novel property in the same sense that a house is property. The house belongs to the builder because he built it. That reason is valid, for all time, to the builder and his heirs or assigns. The novel does not belong to the author for any such reason, otherwise there could be no limitation of his right. It belongs to him for a time, because the State has invested him with a limited ownership as a reward for the service which he performs for the general benefit. When the term of years has expired, his work becomes public property. It is no stealing to appropriate it then, though he or his heirs are living still. But how that which is not stealing, when outside of the time-limit of the copyright, can be stealing when outside of the space-limit, has not yet been made to appear. We object to this being taken for granted, especially with the invidious assumption of a superior morality in receiving it as an article of faith. We 'have a good conscience, in all things willing to live honestly,' and simply wish the right and the wrong to be made more clear."

Mr. Whiton's trouble here arises out of his failure to define, even in his own mind, the terms he uses—a failure not uncommon with disputants of his school. He employs the term "belongs" in two senses, as indicating both moral right and legal possession, and shifts from one to the other as best suits his convenience. For instance, "the house belongs to the builder *because* he built it," not because the law protects him in its possession; but "the novel does not belong to the author," *because* the State only protects him in the enjoyment of it for a limited period. If the first rule be the true one, and a thing belongs, as a matter of moral right, to the maker of it, of course the novel belongs to the author simply because he wrote it. If, on the other hand, the latter rule be the true one, and nothing belongs to a man except what the law protects him in the enjoyment of, his house would cease to belong to him whenever the police failed or refused to expel intruders from it. In fact, if I should construct a house in the Indian Territory, or any other wilderness where there was no law, I should have no more "right" to it than the first comer, and less right than any man who could oust me. That a man does not own a thing "because" the State does not protect his ownership, or only protects it for a limited period, or only imperfectly, is a funny non-sequitur to emanate from a professional moralist.

The true way to approach the copyright question is to base one's reasoning on the rule of morals and common sense, that all work of a man's hands or head belongs to him, of natural right, unless his ownership is modified by some sort of preliminary contract, as in the case of work done for hire. Having laid this down, we can proceed to consider the other and totally different question of expediency, to what extent, and by what means, and under what conditions the law should protect any kind of property. It protects landed and personal property, for instance, in different ways, and some kinds of property, as dogs, for instance, it refuses under certain circumstances to protect at all. The spectacle of one man making money out of the sale of a thing which another man has created, without compensation to the owner, ought to suggest to every moralist who witnesses it that there is a hideous defect in the law which should be promptly remedied, and this, we are bound to say, for the honor of human nature, is the usual effect of such a spectacle. But what it suggests to Mr. Whiton is, oddly enough, that the maker of the article does not own it, or the other would not be selling it. So that if he got to a city where the police was bad, or the courts inefficient, or in which he saw robbers taking people's watches in the street with impunity, he would conclude, by parity of reasoning, that the people robbed had probably no claim to the watches themselves. "If they really owned them," he would say, "why should the robbers take them away from them?"

It was, down to the middle of the last century, the custom in Cornwall to seize and carry off everything which came ashore in wrecks, including the personal belongings of the crew. The good faith in which the people maintained this custom is illustrated by the well-known story of the Cornish vicar who, when the news of a ship ashore reached the church during the service on Sunday, called out to the congregation to wait till he got down from the pulpit and took off his gown, so that all might start fair. If Mr. Whiton had passed by on such an occasion, he would exclaim: "How odd that the things in that wrecked ship do not belong to the crew or the owners," and if asked how he knew they did not belong to them, would doubtless answer that if they did the Sheriff would be on hand to protect them.

Probably on no subject except currency has there been as much curious mental aberration as on copyright. One has only to go back to the reports of bygone currency discussions to find notions about the nature and use of money which, in later and quieter times, read like the ravings of lunatics or the chatter of children. The experience of the world with the copyright is somewhat similar. It is a new and very unfamiliar kind of property, which is dissociated from possession in a way that seems very strange and unmanageable to a world which is only just getting accustomed to large masses of personalty represented simply by bits of paper. Consequently, when the question of providing proper protection for it comes up, one has to tussle at the outset with a host of cranky, old-fashioned people, who think that whatever is easy to steal must surely be, like objects *feræ naturæ*, the common inheritance of the human race.

THE OPENING OF PARLIAMENT.

LONDON, February 27, 1888.

THE Government has now met Parliament, and it is possible to form some judgment on the strength of parties in the House of Commons and in the country. A well-known dissentient Liberal, who was absent from England during the recess, has published his impression that the cause of home rule has not advanced. It may well be that, before the opening of the session, even an impartial eye might have failed to detect any movement in the tide. The effect of the bye elections in the spring and summer of last year had had time to subside. The Conservative majority at Winchester was increased. It would be idle to deny all effect to the desperate energy displayed by the Liberal-Unionist leaders. They have been fighting for their lives, with the deep sea of political extinction behind them, and before them the hope of largely influencing the policy and ruling in the councils of their new allies. Again, the policy of repression in Ireland, theoretically declared by the Prime Minister two years ago, and now carried out by a minister to whom the defiance of hostile criticism is not an uncongenial attitude, while it has lost and not gained adherents, has yet put heart into the Tory party. If, in exchange for the name of power, they must surrender

many conservative principles, it is some consolation for a party which is often taunted with being much bolder in theory than in practice, to figure for once as the upholders of a firm and unflinching policy.

But the final decision of the country cometh not by observation, and few supporters of the Government outside of a newspaper would deny that whatever the future vicissitudes of the question may be, the events of the past fortnight have been discouraging to their prospects, and that at the close of the debate on the Address the position of the Home-Rulers stands considerably improved. This result was at first helped by a group of bye elections, though the elation of some of Mr. Gladstone's followers has received a smart check by the defeat at Doncaster. The significance of bye elections is apt to be exaggerated. Still, at a critical period, when the public mind is extremely sensitive, a run of success, if it were unbroken, might have a widespread general influence. The news of the Southwark election, with a quite unexpected majority, came to the House when Mr. Goschen was replying with effort to a speech of Mr. Gladstone's which had made a profound impression. The dramatic effect of the scene will not be forgotten, and it obviously disconcerted the most able and most confident champion of the Treasury Bench. But in the debate itself the preponderance of advantage was with the Opposition to a degree not often witnessed in these days, when the platform and the press so largely anticipate and discount the effect of Parliamentary discussion.

In the debate on Mr. Parnell's amendment, the issues involved in the present policy of the Government became more clearly defined. The Opposition have all along maintained that the Crimes Act was a weapon forged not against crime but against legitimate combination. It was now argued that the truth of this contention had been proved by experience, although the attempts to put down combination had not been successful; that the injustice and ruin still inflicted on tenants on great estates like Lord Clanricarde's afforded conclusive justification for legal organizations, such as the National League, and even supplied excuses for illegal combinations, such as the Plan of Campaign. The Government made no serious attempt to connect the National League with any criminal object or the perpetration of crime. They did not succeed in showing that they had achieved any result commensurate with a violent infringement of political rights. The population of Ireland are irritated by what they conceive to be the persecution of members of Parliament and other respectable men, petty in character, but necessarily accompanied by many circumstances of individual cruelty and indignity—not to speak of such events as the bloodshed at Mitchelstown. Yet the Government failed to show that they had advanced a step on the road to producing contentment and peace in Ireland.

An important feature of the discussion was the calm and temperate declaration made by Mr. Gladstone on behalf of the Liberal party. He not only disclaimed all sympathy with obstruction, but welcomed the proposed legislation of the Government, which chiefly consists in the Local-Government Bill for England. On behalf of the Irish party, and from the Irish point of view, Mr. Parnell's statements on the same subject were not less emphatic, and even in Mr. O'Brien's remarkable and impassioned speech there was no discordant note. The Coercion Bill gave the Nationalist members a more than plausible excuse for a different attitude last session; the Government programme of last year offered little opportunity for a welcome to useful legislation; and, lastly, in Mr. Gladstone's necessary absence, the Liberals were without leadership at the commencement of the session. Yet many Liberal members would have rejoiced if the present attitude of the Opposition had been more clearly and firmly taken up from the first. The announcement was received with little graciousness, or rather with marked uneasiness, by the more combatant occupants of the Treasury bench, who well know that the best card in their hand is to fix upon the Opposition the stigma of disorder, whether inside or outside the walls of Parliament. The street disturbances in London, unfortunately no new thing, and fortunately not of a serious character, are drawn in to reinforce the doctrine that Mr. Gladstone is preaching a gospel of anarchy and social danger. On the other hand, there is some reason to believe that the metropolitan electors consider that the present Irish policy has infected the London police with the habit of using their batons very freely and indiscriminately. In many quarters it is almost grotesque to observe the readiness to attribute any breach of order or of law to the inspiration of the Liberal leader. The poor Scottish crofters, whose disturbances began six years ago, are spoken of as if they were the dupes of the new home-rule policy.

Again, the Tories taunt the English Home-Rulers with their sentimental policy. They mock at the "union of hearts" for which Liberals profess to strive. But, in truth, the ultimate appeal is made both on one side and on the other to the more generous feelings of the mass of the electors. These feelings are, when roused, a great motive power. Just as the gallery of an humble theatre is intensely moved by the spectacle of injured virtue or triumphant villany, even when presented with little refinement and little art, so in a great national question the so-called sentiment of the multitude will count for something. The Home-Rulers say, the Irish have been, and still are, misgoverned and ill-used. Let them mind their own affairs. But the Unionists also say, these self-styled Nationalists are bad citizens and bad men, the friends of criminals, if not criminals themselves, and they conspire against the dignity of your Parliament. Will you hand over to such men the government of Ireland? Thus both sides appeal to the better feelings, to the moral sympathies, of the masses. As the discussion proceeds, these considerations acquire more decisive importance. As an argument against home rule the danger of separation sinks by comparison into the shade. The difficulty of the Ulster minority appeals to the reason and the feelings of certain men and classes of men, but its influence is local and partial. On the other hand, the character, the motive, the conduct of the home-rule movement and those who promote and guide it, are questions which go home to the minds and consciences of all the electors.

On this issue, as the facts come more and more into the daylight, the Unionist party are not gaining ground. The agrarian crime which has blazed or smouldered in Ireland for at least a century and a half, is doubtless connected, and most closely and significantly connected, with Irish discontent; but the Government has wholly failed to connect it with the operations of the National party. Indeed, a very strong case has been made for the contention that the National League had done more than any other agency to check agrarian crime. In this matter it is sometimes hard to believe that the denunciations of the Government are entirely sincere. They do not deny, indeed they insist on, the representative character of the Nationalist members in relation to the Nationalist movement. Their organs in the press have not scrupled to allege that the leading members of the party are steeped in associations with crime. But, as the Nationalist members become better known, the charge sounds hollow and absurd. Lately depreciated and ostracised in Parliament, it is now the fashion almost to exaggerate the great ability which not a few of them display. But, at all events, it is difficult to doubt their sincerity, or that as a body they are endowed with as much public spirit as any equal number of members. Treated as Ishmaelites even in the Parliament of 1880, they had, indeed, too much acquired the habit of open disrespect for the dignity, usages, and convenience of Parliament. But the Irish party belong to a sensitive race, equally quick to respond to kindness or affront. They feel the cordiality with which they are welcomed as the allies of the Liberal party. As the struggle develops, they are beginning to realize the magnitude of the sacrifice which the Liberal party and individual Liberals made in the cause of justice to Ireland. They themselves are beginning to be known, welcomed, and understood on English and Scottish platforms. Accordingly, the imputation that the Nationalist cause is tainted with criminality is beginning to lose its sting.

As to the orderly conduct of the business of Parliament, the new rule for stoppage at midnight, which was passed on Friday with so much unanimity, obviously affords facilities for obstruction. But in the same proportion that it does so, obstruction will be more keenly resented. There is no doubt that the declaration of the Irish leader on this point, if it is consistently adhered to by his followers, will remove a rock of offence which stood in the way of the cause of home rule. C. D.

TURGENEFF AND THE NIHILISTS.

PARIS, February 24, 1888.

THE person and the works of Ivan Turgeneff are so interesting that I was tempted to read two books recently published—the first, under the title of 'Souvenirs sur Tourguéneff,' the other entitled 'Tourguéneff Inconnu'; titles, it must be said, which were full of promises. The author of the 'Souvenirs' is Isaac Pavlovsky; the author of 'Tourguéneff Inconnu' is Michel Delines, who has translated several of Tolstoi's works, and published books on Russia. Everything must be taken with grains of allowance in these two books, and it is almost impossible to say what is true in them and what is not. The work of Michel Delines seems to have been written chiefly in order to contradict the work of Pavlovsky, and to show him to be entirely unreliable. Though Pavlovsky only appears in it as X——, he is easily recognized. He is represented as a Russian who arrived in Paris with a friend Y——; both gave themselves out as persecuted Nihilists. Turgeneff saw in them victims of the censorship, and of the Draconian laws regarding the press of his own country. He made a protégé of X——, helped him to find his way into the French press, to make translations, lent him money. X—— was of an ungrateful nature, and, when Turgeneff found him out, he uttered this prophecy (if we are to believe Delines): "I was mistaken in this young man, but I can now tell you exactly what his future career will be. Remember what I say: this man will become one of Katkoff's contributors; he will abandon the Nihilists and will cover them with mud; he will publish Souvenirs on me after my death, and represent himself as my intimate friend." He is even said to have added: "Wait, I have not done. This man will not die a natural

death—he will be killed by a woman." Well, Pavlovsky (who is evidently X——) has left the Nihilists; he has not written for Katkoff's paper, but in a paper of the same color. Delines seems to wait impatiently for the accomplishment of the end of the prophecy.

There is only one thing to be remembered in this: it is the great generosity of Ivan Turgeneff. He knew very well that among the Russian exiles in Paris there were many bad and suspicious characters; he pitied their vices as much as their misery, and could not shut his hand to them. Individual charity can hardly ever be blamed; it is perhaps not so easy to excuse Turgeneff when he helped journals of a Nihilistic tinge. He did it as a Liberal, not as a Nihilist, as a sort of protest against the enslavement of the press in Russia; but it cannot be wondered at if this support has been mis represented. A few days after his death, Lavroff, a well-known Russian revolutionist, published in a French paper the following letter:

"Sir, you will oblige me by publishing in your paper [*La Justice*], always in sympathy with the emancipation movement in Russia, a few lines which I have the pleasure to send you. Turgeneff once dead, I have no longer any reason for concealment, and I feel it a duty to make public a fact which, till now, was only known to me and to a small number of persons. When I transferred, in 1874, the editorship of the socialistic and revolutionary review *En Avant* from Zurich to London, Turgeneff proposed to me, on his own initiative, to help me in the publication of this review. During the three following years, during all the time I was the editor, he sent annually 500 francs to the cashier of the review."

This letter made a great sensation in Russia, and in all the countries where Turgeneff had readers. Katkoff reproduced it with shouts of triumph; he had always denounced the tendencies of Turgeneff's novels, and represented him as a secret enemy of the orthodox faith, of the autocratic power, as an adversary of Panslavism. The municipality of St. Petersburg was not allowed to pay the expenses of the ceremony which took place on the arrival of Turgeneff's remains. The great novelist was denounced as a Nihilist.

He was, indeed, the propagator of that name, now so universally employed, though so difficult of definition. The word was uesd in the famous novel 'Fathers and Sons,' which first appeared in 1861. It was considered then a most severe criticism of the state of mind which is called Nihilism. The Russian youth of the universities recognized their own aspirations in Bazaroff, and denounced the type as a caricature and a calumny. Turgeneff was branded as an enemy of progress; he received congratulations from the orthodox and reactionary camp, and these congratulations annoyed him as much as the criticisms of the advanced party. He thought it necessary to defend himself, and the author of the 'Souvenirs' cites a curious letter written by Turgeneff from Paris, on April 26, 1860, to the Russian students at Heidelberg. In this letter he explains his Bazaroff, who towers above all the other personages of the novel:

"I wished to make him a tragical character. He is honest, sincere, and a democrat to his finger-tips. And you find that I have given no good sides to him! 'Force and Matter' [a materialistic work of Büchner's, much read in the Russian universities] is for him a mere work of vulgarization, a work without value. . . . All my novel is directed against the nobility as a privileged class. Look well at the figures of Nicholas Petrovitch, Paul Petrovitch, Arcadii; they all mean weakness, laziness, narrowness. And the æsthetic sense made me choose good representatives of the nobility so as to prove my point the better. If the cream is bad, what must the milk be? To put on the scene officials, generals, thieves, would be coarse and false. All the Nihilists whom I have known (Bielinsky, Bakunin, Hertzen, Dobroliuboff, etc.) were descended from good and honest parents. This fact has great significance. . . . If the reader does not like Bazaroff, with all his coarseness, all his hardness, his dryness, his want of pity, the fault is mine, and I have not accomplished my object. . . . I dreamt of a dark figure, savage, great, only half emerged from barbarism, strong, wicked, and honest, and nevertheless condemned to perish as it always is on the threshold of the future. . . . At the present moment, two men only have completely understood my intentions—Dostoyevsky and Botkin."

This curious letter gives us an insight into the conscience of Turgeneff; he wished to encourage the Russian youth, but not to deceive them. He was a Liberal, not a Revolutionary. He was, above all, an artist; he had the rare and strange power which consists in creating living types. He has told us more about Russia than any other man, not excepting Tolstoi. When he was accused in 1879 of connivance with the Russian Nihilists, he wrote to M. Stasutevitch, editor of the *Messager d'Europe*, a sort of profession of faith, which is cited in 'Tourguéneff Inconnu':

"While," he says, "the editor of the Moscow *Journal* imputes to me ignoble and even almost criminal intentions, he accuses me also of kneeling before a certain portion of our youth, and of courting their sympathy by every means. This attitude, if it really existed, would tend to prove that I renounce my own ideas and adorn myself with the ideas of others. Without wishing to vaunt myself, I have the right to affirm that the ideas which I have expressed, either through the press or orally, have not been modified during the last forty years. In the eyes of our youth I have always been considered as a man of gradation, a Liberal of the old school in the English sense, a man who expects the reforms from above, an enemy by principle of revolution."

Turgeneff is here perfectly sincere; he was a man of gradation, as he says, not a revolutionist. It is not to be wondered at if he offended in turn the sentiments of the Russian aristocracy and of the Russian court, and the feelings of the Russian advanced schools. He described what he saw, and presented to Russia a faithful mirror of her own miseries and faults. How did he become a Liberal, in the most noble sense of the word? He had become so, as a child, in his father's and mother's house. The most interesting part of the two books which I have before me is an account of Turgeneff's family in 'Tourguéneff Inconnu.' His mother was the most curious type of the Russian *grande dame;* she belonged to the family of the Lutovinoffs, very powerful and wealthy lords, who owned a great number of peasants. She had been educated in the house of her stepfather, who tried to seduce her. When she was seventeen years old, she ran away, and found a refuge at the house of her uncle, Ivan Lutovinoff. She inherited his immense fortune at the age of thirty, and married Turgeneff's father, a man of exceptional beauty, who led the dissipated life of the boyards. She became a widow, while she was still young, with two boys, Nicholas and Ivan. She was a severe mother and a severe master. At her house at Spasskoë she lived like a tyrant of the feudal ages. When Ivan Turgeneff went to Berlin to finish his studies, he was accompanied by the family doctor (who was one of his mother's serfs). Young Ivan became his doctor's friend, and did all he could to persuade his mother to allow him his freedom. The mother would never consent to it. Did she not treat him well? was he not allowed at the servants' table to eat what came from the master's table? All Ivan's entreaties were vain. 'Mumu,' one of the most touching of Turgeneff's stories, was inspired by the scenes which he had witnessed in his mother's house. She was the very type of a slaveholder—could not conceive that her rights could be disputed; and there is no exaggeration in saying that she prepared her son unconsciously for the great work of emancipation. For Turgeneff was essentially of a tender, sweet, and sympathetic nature; there was in his heart a fountain of pity for all human suffering, even for those sufferings which are caused by vice. Without knowing anything of the Darwinian theories, he was a sort of Darwinian, and believed in the terrible laws of heredity and fatality. His curiosity was almost morbid, and once brought him to the foot of the French scaffold; but this curiosity was not a mere stimulant of his genius—he really suffered at the sight of pain, of deformity, of moral or physical misery. One of his own stories is called 'The Despairer'; he liked those despairers, victims of their own time, victims of their own nature, half innocent and half criminal, living examples of the frailty of humanity.

Those who read the two volumes I have mentioned, I would recommend to distrust many things which have been inspired by spite, envy, and even hatred; to be very careful in the choice of what may be believed and what must be disbelieved. As for myself, who had the good fortune to know Turgeneff, I had not much difficulty in weeding out many pages, as I had only to remember that Turgeneff was essentially what is called a gentleman.

Correspondence.

PHILOLOGICAL MARE'S NESTS.

To the Editor of The Nation:

Sir: By daring assertions, easily enough set aside by the better informed, dabblers in English philology, or ninety-and-nine out of every hundred that discourse on it, persist, in this scientific age of ours, precisely as of old, in contributing to amplify the stock of popular errors. From the legion of their illusions I select, at present, a mere brace, with a view to their thorough exposure and explosion. A larger number, if dwelt on as fully as I shall dwell on these, would necessitate, it may be feared, an excess of the aridity endurable in a single letter. Some further samples of the same ample brood of chimeras I purpose to examine more briefly on other occasions.

As if there could be no question about the matter, a learned Latinist, the late Professor Charles Short, would have us believe that the word *duration* "was coined in the last century" (*American Journal of Philology*, vol. v, p. 420, 1884).

Immediately on reading this precipitate statement of my old friend and college-mate, there occurred to me several passages in Sir Thomas Browne, who employs *duration* quite as freely as any writer of our own age. One of these passages, if only for its exquisite rhythm, deserves to be transcribed at length:

"But the iniquity of oblivion blindly scattereth her poppy, and deals with the memory of men, without distinction to merit of perpetuity. Who can but pity the founder of the Pyramids? Herostratus lives, that burnt the Temple of Diana; he is almost lost, that built it. Time hath spared the Epitaph of Adrian's horse, confounded that of himself. In vain we compute our felicities by the advantage of our good names; since bad have equal *durations;* and Thersites is like to live as long as Agamemnon."—*Hydriotaphia and Garden of Cyrus*, p. 27 (ed. 1658).

This looked out, on consulting my notes, and turning over a few books, I soon traced the

word in Abp. Ussher (1624), Dr. George Hakewill (1627), Henry Earl of Monmouth (1637), Dr. William Bray (1641), Rev. John Brinsley (1645), Henry Lawrence (1646), James Howell (1651), Rev. Robert Bailie (1653), the translation of Scudery's *Curia Politiae* (1654), the translation of Thomas White's *Peripateticall Institutions* (1656), Bp. Gauden (1659), Bp. Wilkins (1668), Rev. Obadiah Walker (1673 and 1692), Dr. Richard Burthogge (1674), Rev. Theophilus Gale (1677), Guy Miege (1687), Dryden (1692), Lord Preston (1695), Rev. John Serjeant (1697), Rev. Jeremy Collier (1697), Dean Swift (1697), etc. In Dr. Henry More I have counted up twenty-four instances of it, and some thirty in Dr. Isaac Barrow.

Dr. Johnson, with all his successors, Dr. Richardson excepted, simply names Locke as the earliest authority for *duration;* and Locke lived till 1704. A quotation evidencing its use by him in 1690 is given, however, by Dr. Richardson, with another from Sir Matthew Hale (before 1676), and one of the fifteenth century from Chaucer. To the passage which he extracts from Chaucer's *Knightes Tale* he might have appended one from the same poet's *House of Fame*, near the end.

Besides consulting Dr. Johnson, probably Professor Short thought it sufficient to explore the concordances to Shakespeare and the Bible, as warrant for the decision which he arrived at so unhesitatingly. A similarly otiose procedure on the part of any one having to do with a word in the classical languages, he would doubtless have held to be unscholarlike in the extreme. But it was only our mother-tongue, poor thing, that, when he despatched *duration*, he was deigning, for once in a way, to concern himself with; and, in default of a little research, and even of a moderate acquaintance with our literature, he seems to have considered intuition as competent to authorize him in passing a categorical judgment. Thus much for *duration*.

I now advert to the word *mostly*, an adverb parallel to *nearly* and *firstly*, for example, in having been preceded by a shorter form which was itself an adverb. If some one discovers that it was once flouted as a tasteless and unnecessary innovation, such as *muchly* is in our eyes, small should be the wonder. It "had not yet arisen," peremptorily pronounces Mr. T. L. Kington Oliphant, commenting on *most*, bearing the same sense, used in a work which "must have been written about 1730 or earlier." (*The New English*, 1886, vol. ii., pp. 159, 161.)

To reach this remarkable conclusion, Mr. Oliphant can have done no more than supplement very superficial reading by a mere glance at the lazy doings of certain lexicographers. For, though Dr. Richardson cites only Hume for *mostly*, Dr. Johnson cites Bacon for it, but without giving due particulars. A friend has pointed out to me that his citation is from the *Advertisement touching an Holy War* (1622). See Bacon's *Works* (ed. Spedding and others) vol. vii., p. 30. Bailey inserted *mostly* in his Dictionary in 1730, if not before.

Already, I apprehend, the reader may be disposed to doubt which has the upper hand, as furnishing a title to discredit—the self-confidence of Mr. Oliphant, or his shallowness. As he has exhibited some of his salient peculiarities in connexion with the point under notice, so he has exhibited them, and quite as flagrantly, in cases which it would overtask patience barely to catalogue.

Only within a short time have I searched to ascertain how far *mostly* was accepted in the seventeenth century. Of its prior existence I know nothing; but, as the outcome of a desultory quest, I speedily satisfied myself that, let alone 1730, not even in 1630 can it have excited much surprise as a novelty. I had somewhat expected to come on the word in that intrepid verbarian, Joshua Sylvester; and my failure to do so may have been owing to the fact that my special excursion in his cataclysm of somniferous poetastry was not a more protracted one. Why it is that Mr. Halliwell-Phillipps assigns a niche to *mostly* in his *Dictionary of Archaisms and Provincialisms*, and speaks of it as belonging to "various dialects," must be left to conjecture. Quotations for it which I have collected from older authors are subjoined:

"Our Cities and suburbes are, *mostly*, seized in Lay fee."—Dr. William Sclater (1621), *The Quæstion of Tythes Revised* (1623), p. 192; also at pp. 168, 217.

"Our Religion is, *mostly*, talke and discourse."—*Id.* (1626), *Expos. II. Thess.* (1629), p. 42; also at pp. 103, 153, 157.

"*Mostly*, we account those things neither good, rational, nor commodious, which," &c.—J. Pettus (1657), in *Loveday's Letters* (ed. 1663), A 3 *v.*

"The first Principle, which he, *mostly*, calleth the Monad, otherwhere he calls the Father."—Dr. Richard Burthogge (1674), *Causa Dei* (1675), p. 245.

"The Meazels is a Disease incident, *mostly*, to Children."—Guy Miege, *French Dictionary*, Second Part (1687), under *mostly*.

"In the Annotations, also, I have, *mostly*, followed them."—Lord Preston, Translation of *Boetius's Consolations of Philosophy* (1695), p. xii; also at p. 230.

"The Confusion of Ideas . . . springs, *mostly*, from the Reasons assign'd by himself."—Rev. John Serjeant, *Solid Philosophy Asserted* (1697), p. 275; also at p. 454.

"Pleasure consists, *mostly*, in Fancy."—Rev. Jeremy Collier (1697), *Essays* (1703), Part I., p. 72; also at p. 122.

"Your Converse, I conceive, would be, *mostly*, with the Latter."—*Id.*, Translation of *Marcus Antoninus's Conversation with Himself* (1701), p. 86.

"A Troop of Servants *mostly* arm'd."—Edward Ward, *Hudibras Redivivus* (1705–7), vol. I., Canto xiii.

Obsolete equivalents of *mostly* are seen in *mostwhat* and *most an end*, both of them long very common, and the latter of them not yet dropped in vulgar speech; in *most deal;* in *for most part;* and also in *almost*. The last was very current till about 1600. Five and twenty quotations for it, of the era of Queen Elizabeth, are at my elbow: six from one small volume.

Among the living dialectal synonyms of *mostly* are *mostlins*, *mostlings*, *mooastlins*, *meeastlins*, *meeastwise*, *most in general*, *most in deal*, and *most part*, to which may be added the North British *maistlins*.

Hitherto I have been occupied with *mostly* in the sense of *most* under its extensive aspect, or "for the most part"; a phrase, in passing, of venerable antiquity. But I have still to speak of *mostly* as importing "almost," "very nearly," "well nigh," "all but." It seems to have wholly escaped the attention of philologists; and it is seldom met with, I suspect, in authors of any period. The only old book in which I have observed it, a book which could attract none but the veriest Dryasdust, is by the same singultous saint whom I have first adduced for the *mostly* now classical. The ensuing passages are taken from it:

"We sit, *mostly* all, under our owne vine and figtree." "But how have wee, *mostly* all, given occasion to have Mercuries statue our fittest Embleme?" "So is their speech gracious, *mostly* alwayes."—Dr. William Sclater (1626), *Expos. II. Thess.* (1629), pp. 261, 263, 285.

Speaking for his fellow-countrymen in 1545, Nicolas Udall remarks:

"No man of our tyme, and in our Englishe toungue (which none but our selfes, for our owne use, do much passe on), wryteth so ornately, but that he hath, in soondrie woordes & phrases, some smatche of his native countrey phrases that he was borne in."—Translation of *Erasmus's Paraphrase* (1548), *Luke*, 6 *r.*

And so it continued to be, very generally, long after Udall's time, and notably as respected the learned Dr. Henry More, who was flourishing a hundred and forty years later. As to Sclater, who wrote in Somersetshire, if he was not born there, whether his *mostly*, in its rarer signification, was a rusticism which he adopted from his humbler neighbors, future inquiry possibly may determine.

The *mostly* here considered I have frequently heard in conversation; and, moreover, I have had before me, upwards of a score of times, manuscript evidence of its being equally prevalent in England, in Scotland, and in Ireland. As I have already said, it is not, however, often seen in print. Yet a leading article in the London *Daily News* of Dec. 22, 1886, has, at p. 5: "*Mostly* all were small meat-eaters." Again, Dr. Murray, in his incomparable Dictionary, gives "*mostly* all" as the leading definition of the disused *almost*, "for the most part."

And here, not unfitly, I may quote De Foe and Sterne, as having, with, presumably, many another, at least seemed to intend, by *mostly*, *most* taken intensively, that is to say, "more than all else," "in the greatest degree":

"I told him, with freedom, I feared *mostly* their treachery and ill-usage of me, if I put my life in their hands."—*Robinson Crusoe* (1719), vol. i., p. 121 (ed. 1781).

"My father had scarce read the letter, when, taking the thing by the right end, he instantly began to plague and puzzle his head how to lay it out *mostly* to the honour of his family."—*Tristram Shandy*, vol. iv., ch. xxxi. (1761).

Touching *most*, "almost," no proof that it is other than a modernism is known to me. That it is shortened from *mostly* is very unlikely. Pretty certainly, as Dr. Murray rules, we have, in it, an aphetization of *almost*, through *a'most;* and it must have originated among the ignorant, to whom it has, all along, been ordinarily confined. But Mr. Goold Brown, Mr. J. R. Bartlett, and Prof. Schele de Vere, with others, are wrong in thinking it an Americanism. One hears it, I suppose, as much on this side of the Atlantic as on the other. Mr. Brown quotes, for it, a book in which it is used seriously. This is not the case with it in the Rev. James Pycroft's *Agony Point* (1862), pp. 300, 354. To the north of the Tweed, one may infer, it is not reputed objectionable; for we find "*most* any verse" at p. 109 of the second edition of *English Composition* (1879), by "John Nichol, M. A. Balliol, Oxon., LL.D., Professor of [the] English Language and Literature in the University of Glasgow." In this undoctorly doctor's school-days, deviation into bad English can hardly have been accounted an irregularity calling to be treated with administration of birch.

Though I am not here handling the respectable uses of *most*, I give a quotation in which, denoting "in the greatest degree," it is so qualified that the result is to produce a strikingly anomalous combination:

"Whan tidynges herof came to Cirtha, such as defended the towne were moch abasshed, but Adherball *all most* of all."—Alexander Barclay, translation of *Sallust* (Pynson's 1st ed., *c.* 1520), fol. 22.

This *all most* can by no possibility represent the old *allermost* or *aldermost*.

Very singular, too, is the locution to signify "for the most part," exemplified below by Nicolas Udall:

"The daye, also, beeyng nothyng fitte for the purpose of dooyng suche a thyng, was not *all of the moste* to their contentacion, aswell

for the high solemnitee of the feaste self, as also for the great resorte of people to thesame feaste." Translation of *Erasmus's Paraphrase, Luke* (1545), 168 *v.* (ed. 1548).

Your obedient servant,

F. Hall.

Marlesford, England, January 20, 1888.

VON HOLST ON AMERICAN CONSTITUTIONAL LAW.

To the Editor of The Nation:

Sir: The last number (January) of Von Sybel's *Historische Zeitschrift* contains an article by Dr. von Holst on the Constitutional Law of the United States in the light of English parliamentarism. Although this writer has made our history and constitutional development his peculiar study, and his works are regarded as authoritative, some of the views expressed in his article show how difficult it is for any foreigner to understand perfectly the institutions under which we live. Thus, in speaking of the Senate, he says that Senators rather than members of the lower house are regarded by the masses of the people as their genuine representatives. Another similar remark is, that everybody always knows who the Senators from his State are. How many New Yorkers knew that Miller was one of their Senators, or that Platt was one, before the "me too" incident? How many Jerseymen can tell off-hand the names of the present Senators from that State? How many Pennsylvanians can name both of their Senators?

Dr. von Holst argues, at considerable length, that the President has no share whatever in the legislative power, and that the veto gives him but a negative influence. How can that be called a negative influence which wields sixteen per cent. of the entire vote of Congress? A measure passed by fifty votes out of every ninety-nine in both houses goes to the President for his approval, and, if approved, becomes the law of the land; but if he returns it vetoed, it is null unless passed by sixty-six votes out of every ninety-nine. In the Fiftieth Congress, numbering in both houses 401 members, the actual difference between a majority and a two-thirds vote is exactly sixty-six, so that the veto power requires sixty-six votes to overcome it. These sixty-six votes of the President are like the sword of Brennus, and weigh heavy in the scale—almost as heavy as the prohibitive veto of the English Crown, which, however, has not been exercised since 1707.

Aside from that, however, it seems like taking a very literal view of things to say that because the President and his Cabinet do not sit in Congress, and do not actually introduce bills, they can do nothing but await passively the action of Congress. In the first place, they always can and frequently have caused members of Congress to introduce bills; secondly, any President who has decided views concerning legislation can have them put into effect by a public appeal to Congress as a body. Of this a conspicuous instance, which goes far to upset the Professor's theory, is the present Tariff Bill, which may be regarded as the direct outcome of Mr. Cleveland's recent message.

Our Constitution, like that of any other progressive country, is in a state of flux, and what is true of it to-day may not be true to-morrow. Dr. von Holst predicts very confidently that the Senate will never be shorn of its power as the House of Lords has been. The fate which has overtaken the Electoral College should have served as a warning to make him more cautious. The Electoral College, it is well known, was designed as an autonomic body acting on its discretion, but it has degenerated not even into a body of delegates, but into a body of messengers with absolutely nothing to do but to carry a message which might be better carried by the mails.

As an additional illustration of the difficulties which even the best informed foreigner has to contend with, it may be mentioned that in citing a letter of "G. B." in the *Nation* of February 24, 1887, Dr. von Holst quotes as follows: "He has to sit an idle spectator of ground (grand?) and lofty tumbling, etc.," the word in parenthesis being his emendation of the text. But perhaps this is no worse than some of the Shakspere emendations one meets with.

N. Z.

New York, March 5, 1888.

GOLDSMID'S TRANSLATION OF GROTIUS ON THE ORIGIN OF THE NATIVE RACES OF AMERICA.

To the Editor of The Nation:

Sir: In 1884 there was printed in Edinburgh by Mr. Edmund Goldsmid, as one of the numbers of his *Bibliotheca Curiosa*, a translation into English by himself of the little volume entitled 'De Origine Gentium Americanarum Dissertatio,' which Grotius published in Paris, in 1642, while Swedish Ambassador at the French court. We are told in an "Introduction" that the tract first appeared in 1542, but this may be a typographical error. Of the quality of the translation, however, I will proceed to give a few examples. Grotius is made to say:

"I see that there are many who think that all those tribes were from Scythia, which we now call Great Tartary. They base their argument on this, that at Anianus [Behring's Straits, evidently, *note*]—be it a strait or a bay (for which of the two it is not clear)—there is no great space between Tartary and America. Now, if it is a gulf, the lands must be contiguous, and in that case the passage would be easy; if it is a strait, it becomes more narrow the further it is entered, and the opposite coasts, just like those of the Hellespont, or of the Bosphorus, in Thrace, forbids navigation even for merchant vessels."

A note remarks: "This passage seems either obscure or ridiculous." But the original reads at the end: "Ac proinde fauces illas, quales sunt Hellesponti, aut in Thracia Bosphori, nullo negotio navibus potuisse transmitti," of which the meaning is plain enough: "And accordingly its entrance, like that of the Hellespont or the Thracian Bosphorus, could be crossed by ships with no difficulty."

Again, we read, "Posts in Florida have been set up for the ascertainment of maximum heat," as a rendering of "Tribunalia in Florida ad experimentum altissimi æstus," *i. e.*, "Platforms made conformable to the highest tide." In another passage we are told that "From time immemorial they believed that the soul survived the body, which Lucan attributed to the tribes which he despised as Arctic"; the last clause being a version of "quos Arctos despicit," or "whom the Great Bear looks down upon." So one of Marius's soldiers is transmuted into "Marianus, the soldier," and Peter Martyr into "Peter the Martyr." But I will not trespass upon your space to point out more such blunders.

Grotius's language seems to have fared almost as hard at the hands of his translator as his arguments did at those of an acute critic, John De Laet; but we will not attempt here a summary of the discussion. It was carried on by a double exchange of broadsides in the shape of a 'Dissertatio,' etc., by Grotius, and 'Notæ ad Dissertationem,' etc., by De Laet; followed by 'Dissertatio Altera,' etc., by Grotius, and 'Responsio ad Dissertationem Secundam,' etc., by De Laet. The latter gets the better of the argument, in my judgment, and Grotius, losing his temper, quotes Catullus to abuse his adversary as "obtrectator, opaca quem bonum barba facit." Finally, he retires from the contest with this parting shot at his opponent's Latinity:

"Latius haud Latius satis est, nec scribere cessat Latius. Ut sileas, Latius, est satius."

Henry W. Haynes.

Boston, March 7, 1888.

SENATOR INGALLS'S "SARCASM."

To the Editor of The Nation:

Sir: Having read the speech of Senator Ingalls on a pending pension bill, with editorial comments upon the power of "sarcastic invective" possessed by that eminent statesman (or which possesses *him* in the sense in which the Scriptural swine were possessed), I am reminded of a story which a friend of mine—a lawyer—tells of his first case. He was retained for the defence of a negro accused of assault and battery. At the trial, the prosecutor having told his story, the prisoner was put upon the stand, and asked to state the circumstances in his own way. He said he was sitting in his doorway in the cool of the evening, and saw the prosecutor approaching; that the prosecutor stepped upon the footway and said: "You black ——— ———," etc. (the words are left to the reader's imagination; the sense can be gathered from the speech above referred to). "Well, what did you say to that?" asked the prisoner's counsel. Drawing himself up, the witness replied with dignity: "I do not remembah my exact words, sah, but I have no doubt it was something equally sarcastic."

Yours, Joseph Parrish.

Philadelphia, March 7, 1888.

Notes.

Cassell & Co. publish immediately a Life of the late Emperor of Germany, by Archibald Forbes.

Harper & Bros. announce the sixth and last volume of Kinglake's 'Invasion of the Crimea,' and 'For the Right,' by Karl Emil Franzos.

The second volume of Thomas Stevens's 'Around the World on a Bicycle,' and J. H. Kennedy's 'Early Days of Mormonism,' are in the press of Chas. Scribner's Sons.

Mr. Ad. F. Bandelier, of the Hemenway Southwestern Archæological Expedition, to whom is assigned the documentary historical research, and who last year copied in Mexico very valuable documents of which a large number were completely unknown, is now at work at Santa Fé, N. M., on the Archives, by courtesy so called. He has already saved the oldest papers, but has thus far found only two antedating the rebellion of 1680, viz., one of 1636 and another of 1664, which bears the signature of Diego de Peñalossa. These documents are perfect revelations as to the period when the Spaniards were in the vicinity of El Paso, and when the conspiracy of Casas Grandes was being prepared.

With the April number, *Babyhood* is to cross the water and have an English edition simultaneous with the American—a merited expansion of a most excellent periodical for mothers.

The *Youth's Companion* will publish directly the story of the late Miss Alcott's girlhood, written but a few months ago, and full of interesting reminiscences of the Concord group.

In the last number of *Nature*, Sir Joseph Hooker pays an affectionate tribute to his old

friend Asa Gray; and Dr. Fr. Hoffmann, editor of the New York *Pharmaceutische Rundschau*, in his March issue, prints an equally appreciative biographical sketch, with a list of Dr. Gray's most important contributions to botanical literature—a product surprising in itself, but accompanied, as we know, with a vast literary activity in other directions. A fairly good "process" portrait accompanies the article.

On January 15 appeared in Berne the first number of the monthly *Le Droit d'Auteur*, organ of the International Union for the Protection of Literary and Artistical Works. It will be the main source of authentic news, statistics, and discussion relating to the objects of the Union. The subscription price of five francs, sixty centimes, may be sent to MM. Jent & Reinert, Berne.

We commend to thoughtful readers Mr. Henry Holt's paper in the March *New Englander* on "Some Practical Aspects of the Literary Life in the United States," especially as it is at present injuriously affected by the absence of an international copyright. The first portion deals in a sensible and practical way with the aspirations of young persons to become writers for the press and authors of books. The last portion narrates the rise and fall of the "courtesy of the trade," with the rise (but as yet no fall, only failures) of the "pirate." Mr. Holt's well-known views as to translations not paying and as to the decline of the book-buying habit, are here repeated. He declares that "a very small portion of even the paper and printing interest of the country would be affected by the removal from American soil of all reprinting of books copyrighted in foreign countries." We can hardly agree with Mr. Holt in explaining the contrast of the state of American letters in 1851-1876 with that of the subsequent period by the breaking down of the courtesy of the trade or "virtual international copyright."

Seldom is any issue of the Proceedings of the American Antiquarian Society so largely and permanently valuable as Part I. of Vol. V. We have already made mention of Prof. Franklin B. Dexter's laborious "Estimates of Population in the American colonies [up to the First Census in 1790]." It is here printed in full, with graphic charts. Prof. Dexter observes of Rhode Island, that "her share in the proceeds of the slave trade is suggested incidentally by the fact that, at the acme of her colonial prosperity, one person of every nine within her borders was either a negro or an Indian—four or five times as great a proportion, that is to say, as in her neighbors, and unequalled anywhere north of Mason and Dixon's line." The British occupation during the Revolution caused a marked loss of slaves to Virginia, North and South Carolina, and Georgia, but most of all to South Carolina, where the whites were actually left far in the ascendant. Mr. William B. Weeden's paper on the "Early African Slave Trade in New England" is another well worth preserving. It reveals Peter Faneuil's gains in the slave trade with one hand, while the other was engaged in public and private charities and in building the "Cradle of Liberty." There are two opposing papers on an episode in King Philip's War. Finally, Mr. Andrew McFarland Davis furnishes some curious particulars concerning "The First Scholarship at Harvard College," the gift of a woman, Lady Moulsham or Mowlson—a name we would suggest for bestowal on the first building erected for the "Annex."

An eminent benefactress of the present day, Mrs. Elizabeth Thompson, is commemorated in the *New England Magazine* for March, with a portrait.

The eleventh annual issue of Spofford's 'American Almanac, and Treasury of Facts, Statistical, Financial, and Political,' for the year 1888, has been made by the American News Co. It is an indispensable work, though the recognition of this fact is not as general as it should be.

The twenty-fifth issue of the 'Statesman's Year-Book' (Macmillan) is also a standard work, and its superior typographical attractiveness doubtless bespeaks a more liberal patronage than Mr. Spofford's labors have earned. Equipped with both these manuals, an American citizen can dispense with a large number of books of reference relating to his own and to foreign countries.

Scribner & Welford send us samples of "Bohn's Select Library," which we find to be old favorites in a new external guise: slender duodecimos in olive-green smooth-cloth backs, neatly stamped in black and red. Thus we have Cary's 'Dante's Inferno,' Oxenford's 'Goethe's Boyhood,' Anna Swanwick's metrical version of the first part of 'Faust,' Schiller's "Mary Stuart" and "Maid of Orleans" in one binding, Lessing's 'Laokoon,' and Bacon's Essays. They make a very taking array on the shelf.

The ever-swelling "Cassell's National Library" seems to become international in the case of the 109th issue—Mrs. Anna Bowman Dodd's 'Republic of the Future.' Other late numbers are Shakspere's "Lear," Shelley's "Prometheus Unbound," Dickens's 'Cricket on the Hearth,' 'Anecdotes of Dr. Samuel Johnson,' and more of Plutarch's Lives.

In the "Knickerbocker Nuggets" series of the Messrs. Putnam we have the 'Vicar of Wakefield,' with illustrations; and the same story is added to Ginn & Co.'s "Classics for Children," but abbreviated and verbally annotated.

Collectors—and, in these latter days, who so devoid of curiosity and culture as not to collect something?—will receive with pleasure the pretty little book which M. Paul Ginisty has recently written about the vagaries of some of their Parisian brethren. 'Le Dieu Bibelot' (Paris: Dupret; New York: F. W. Christern) has for its sub-title, "Les Collections Originales"; and, although it contains half-a-dozen other sketches, its chief interest is in the first group of chapters, describing eight rather unusual collections. One gentleman collects canes, another keys, and a third advertising cards often of historic interest and artistic merit, while a fourth is gathering death's-heads, mostly carved in ivory and taken from old rosaries. Quite as lugubrious is the autographic mania of yet another, who has sought out letters and manuscripts by notorious murderers—the chief prize being a sort of holographic last-dying-speech-and-confession. We read also of an admirer of the circus-ring who has a collection of "posters" and *billets-doux;* and we are told of yet another special student who has succeeded at last in getting together nearly all the utensils and implements of an apothecary's shop of the seventeenth century.

On January 31, the honor degree of M.A. was bestowed at Oxford on Dr. Lawrence H. Mills, S.T.D., University of New York, for his labors in continuing Darmesteter's editing of the Avesta. Dr. Mills was selected for the task by Prof. Max Müller.

An unfortunate misplacement of sentences in the Note about the sanctuary of the Kabeiroi on p. 202 of our last issue, will be corrected by taking the sentence, "M. Kavvadias. . . . . Asklepios" from the middle, and putting it at the end of the paragraph.

—The article on "Foreign Jurisdiction in Japan," by Mr. E. H. House, in the *New Princeton Review* for March, is a timely and forcible discussion of a subject of vital interest not only to natives, but to American residents in the Mikado's empire. The writer exposes in detail the shameful oppression of the Japanese through the system of exterritoriality, which virtually bars out the lawful owners of the soil from every foot of the "foreign concessions" in the five ports and two cities in which aliens reside. He spares not to show, also, that the Americans have joined hand and purse with European Powers to continue a state of things that long since lost the shadow of necessity or justice. Temporary arrangements once made, as the Japanese believed, for mutual convenience, have, in the presence of the inevitable gunboat and of armed regiments camped on the soil, gradually hardened into "rights" and "law." The old fable of the wolf and the lamb has been enacted over again. Indeed, we think it not disprovable that when "her Britannic Majesty" was "invested with power and authority in remote countries to the same extent as if obtained 'by cession or conquest,'" the Americans were quick to follow suit, in establishing consular courts, and in "practically extinguishing all rights of the Japanese Government over the regions assigned for foreign occupation and traffic." Indeed, as we remember, in the ordinary conversation of our fellow-countrymen at Yokohama, during the first decade or so following its opening, the question of justice obtainable at the United States consular court was largely one of five or ten dollars. Unfortunately, too, even in such schemes as the bombardment of Shimonoséki, and the subsequent levy of three millions of dollars blackmail, the United States Minister joined hand, besides obtaining a private indemnity to boot, as his diplomatic correspondence shows. Common sense, however, ruled at Washington when another of our envoys asked for a guard of twenty-five soldiers, even when he was living at Yokohama, twenty miles from the capital where he ought to have been. Two illustrious names, Harris and Bingham, occur in the list of American ministers in Tokio who believed in justice and protested to our Government again and again that the United States should withdraw from the "coöperative policy" and entangling alliance with Europeans in Japan. Neither of these men needed American soldiers camped on the soil of Japan, while their absolute freedom in moving openly among the natives contrasted strongly and even amusingly with the cage-like room in which one of our envoys habitually slept in the Legation building, for which, by the way, the United States paid no rent.

—Revision of the treaties with Japan is required by all the sound traditions of American policy, and by the convictions of our people. Withdrawal from the European league and "coöperative policy" is the first step; freedom to Japan to regulate her own customs and taxes is another. So far, all Americans doubtless agree. Mr. House, in his closing paragraph, pleads for "an unconditional release from the ties which hold her [Japan] in political and moral enslavement. One frank and outspoken word from the Chief Magistrate of this republic would enable her to reclaim the liberties to which she is as honorably entitled as the most enlightened of western countries." Here, we are compelled to differ. The question of putting American citizens under Japanese law

involves a reversal of old custom and diplomatic precedents, and even the President cannot act upon sentiment alone. He can be but the servant and representative of the people and the Government. Not only to the average American, but to most intelligent people, and even special students, Japan is still, despite the outward bloom of civilization, and even a ready-made "code of law . . . adapted to all the exigencies of the situation," an Asiatic power. It is hardly true, we think, that "no one disputes their intention or their ability to fulfil these [their] promises." Even if President Cleveland and the Senate believed all the Japanese Government professes, they cannot move without assurance from those most competent to speak—the Americans resident in Japan, for instance—that everything is ready for the total abolition of exterritoriality. The feeling of Americans toward Japan is not only very warm, but we think comparatively unselfish. Europeans have large trade interests in Japan, while the people of the United States buy generously and sell almost nothing. They are so ready to hope and believe good of her, to lighten her burdens, and to assist in her struggles in progress, that only the acts of the Japanese Government itself can chill American sympathy and retard revision of the treaties.

— Mr. H. B. Wheatley contributes to the January number of the *Bookworm* (Geo. J. Coombes), under the title "A Mad Book," a brief account of the works of Robert Deverell, formerly Fellow of St. John's College, Cambridge, and M. P. for Saltash. He refers especially to a treatise, privately printed in London in 1805, called 'Andalusia; or, Notes tending to show that the Yellow Fever of the West Indies and of Andalusia, in Spain, was a Disease well known to the Ancients.' Though from this title one would naturally expect a medical treatise, on examination it turns out to be "a partial reprint of Milton's 'Masque of Comus,' with illustrative notes showing the hidden meaning of that poem to be an account of the yellow fever and the means of cure." This was soon followed by other small works of a similar character, but Mr. Deverell's literary career culminated in the publication in 1813 of a work in six octavo volumes, which he called 'Hieroglyphics and Other Antiquities; in treating of which many favorite pieces of Butler, Shakspere, and other great writers, in prose and verse, are put in a light now entirely new, by notes, occasional dissertations, and upwards of 200 engravings in wood and copper.' The illustrations are mainly full-page pictures of the surface of the moon, as it appears in the telescope, and detached portions of it, the aim of the author being to prove that many of the phrases, characters, and incidents, not only of Shakspere's plays, but of "all the classics," are merely allusions to the *appearances of the moon.* In the first volume he applies his novel theory to Hudibras and one of Butler's minor works, "The Elephant in the Moon." The second and third contain parts of "Hamlet," "King Lear," "Othello," and "Merchant of Venice," with illustrative notes and pictures. The following examples will give some idea of the work, though, of course, they do not show the learning which the author really possessed. "'Moult no feather': this very singular phrase may be referable to the circumstance that the prototypes of *Rosencrantz* and *Guildenstern* appearto be naked in the moon, and that there are small detached portions of shadow over their heads resembling the feathers flying about birds in the state of moulting them." "'Get thee to a nunnery.' The shadows at the right and left of *Ophelia's* face in the moon, from beneath which she seems to look out as from a veil, sufficiently explain this expression, so frequently repeated."

—In his introduction to the third volume Deverell says: "Though I would not be understood to assert that all the plays of Shakspere are to be explained by a reference to appearances in the moon, yet, lest it should be thought that the coincidences pointed out between these appearances and the plays contained in the second volume ought to be attributed to accident rather than to design; before other matters are entered upon towards the end of this volume, I shall offer an elucidation of two more of his plays, 'Othello' and the 'Merchant of Venice,' by the same method as before." We do not know that we can find a better note to close our excerpts from this remarkable work than this upon a speech of *Shylock:* "The frequent mention of the Ryalto may be referable to the circular form of the moon, any portion of which, and particularly the half-moon, may be considered as resembling the arch of a bridge." It should be said that the notes are frequently accompanied by engravings of the shadows in the moon, so arranged as to bear some faint resemblance to the subject treated. In the succeeding volumes Horace, Terence, Sophocles, and Milton are similarly commented upon. It will hardly be credited, but the British Museum Catalogue shows that in 1816 a second edition was published of this strange work of a lunatic (in the most literal sense of the word) scholar. A writer in *Notes and Queries* says that Mr. Deverell's friends endeavored to suppress this book. Whether this is true or not we cannot tell, though the only copies of which we have any knowledge now existing are the one referred to above and one in the Barton collection in the Boston Public Library.

—Mr. Sidney S. Rider, in his *Book Notes* (March 3, 1888), is led, under cover of some criticisms on Mr. G. W. Williams's recent work on Negro Troops, to censure the colored people of Rhode Island. He complains, for instance, that when (August 4, 1862) Gov. Sprague of Rhode Island issued a call for a colored regiment, "the negroes would not enlist," and quotes Stone's 'Rhode Island in the Rebellion' to the effect that "a rendezvous was opened and about one hundred men enrolled." But the fact is, that the whole colored population of Rhode Island was then hardly large enough to furnish a full regiment of adult male negroes. The whole number of colored males between eighteen and forty-five years of age in Rhode Island was, in 1860, but 1,165 (compendium of 9th census, p. 553), and from this must be subtracted all the lame, halt, blind, and otherwise unfit for military duty. There may possibly have been seven or eight hundred in the State who would have passed the mustering officer, though it must be remembered that these officers were much stricter in their scrutiny at that period than later, so that this estimate may be too high. If a hundred of these enlisted at once, it is a very creditable showing for Rhode Island, especially when we take into view the bitter prejudice then existing against colored soldiers, and the distrust everywhere felt of the somewhat impulsive and unstable disposition of Gov. Sprague. When Gov. Andrew, eight months later, set about the same enterprise in a more deliberate and careful way, he found plenty of recruits.

—Mr. Rider is scarcely more just when he comes to speak of the colored regiment of heavy artillery afterwards raised in Rhode Island (8th U. S. Colored Heavy Artillery—afterwards 11th U. S. C. H. A.). He complains of this regiment for its large mortality, yet has to admit in the same breath that it was under command of a merely nominal Colonel (Sypher), who never even saw the regiment united, and whose name seems to have been curiously significant of his value. If our war proved anything, it proved that the health and physical condition of the very best regiment depended almost wholly on the way in which it was commanded; and this was especially true of the colored troops, which were constantly exposed, unless their commanding officers stoutly resisted it, to a disastrous excess of fatigue duty. It is rather hard, under these circumstances, to dispose of the 324 men whose lives were wasted by saying merely that "they lacked endurance." As for the fact that they were "never in battle," the obvious remark is that this was not an uncommon experience with heavy artillery regiments.

—Mr. F. C. Clark writes us from the University of Michigan:

"Permit me to say a few words regarding the article in the *Nation* for March 1 on 'The Iowa Railroads.' In regard to Gov. Larrabee's recommendation concerning 'the passage of a law fixing reasonable, maximum rates of freight,' you say 'it is something entirely new. . . . No Legislature has thus far taken this task on itself.' I beg leave to correct your mistaken impression by saying that it is entirely in accord with many of the State Boards of Railroad Commissioners, and delegated to such boards either by the Constitution direct or by legislative enactment. The Constitution of California expressly provides that 'the Commissioners shall have the power, and it is their duty, to establish rates of charges for the transportation of passengers and freights.' The Board of Railroad Commissioners in Illinois, by act of May 2, 1873, are directed to make for each railroad doing business in the State a schedule of reasonable maximum rates for transportation of freights, passengers, and cars, which schedule shall be taken as prima-facie evidence that the rates prescribed therein are not extortionate. Such is the case also in New Hampshire, Tennessee, and other States."

—Vol. ii, No. 5, of the Publications of the American Economic Association is entitled 'Two Chapters on the Mediæval Guilds of England,' by Edwin R. A. Seligman, Ph.D. (November, 1887). The preface states that in chapter i ("The Guilds-Merchant") the author has derived assistance from Gross's 'Gilda Mercatoria' (Göttingen, 1883), and in chapter ii ("The Craft Guilds") from Von Ochenkowski's 'England's wirthschaftliche Entwickelung' (Jena, 1879). Mr. Seligman's obligations to Gross's thesis seem to be much greater than one would infer from a perusal of the preface. Though the two writers diverge on some minor points, and the arrangement and a few of the illustrations are different, the kernel of Mr. Seligman's chapter i and that of 'Gilda Mercatoria' are identical; the former contains no important results, no important argument, and no important references to the sources, that are not to be found in the latter. This, we think, should have been pointed out less equivocally in the preface and footnotes. The reproduction of verbal errors, such as "Walworth" for "Walford" (Seligman, 35, 67; Gross, i, 2), shows how carefully the German work has been conned. What we have said of chapter i and Gross's treatise applies, though in a somewhat less degree, to chapter ii and Von Ochenkowski's book. The main fault of this part of the work is that many generalizations are based wholly upon London, whose municipal development was, in many respects, different from that of the other towns of England. The genesis of craft gilds can be studied to best advantage in the provincial boroughs of England; and the

materials for such investigations, both printed and unprinted, are abundant. The range of Mr. Seligman's data is somewhat broader than that of Von Ochenkowski's, but not broad enough. Though the work before us is not free from errors of detail, the author is deserving of much credit for giving to the world an excellent condensation of Gross's and Von Ochenkowski's researches, in a lucid and agreeable form—free from those pyrotechnical displays of erudition that obscure, rather than illumine, the two German productions. Mr. Seligman's pamphlet will, we hope, at length dissipate the absurd theories introduced by Brentano, eighteen years ago, which English scholars then swallowed, and have been complacently digesting to the present day. It may be added that among the recent announcements of the Clarendon Press is a treatise on 'The Gild Merchant' by Gross, which, we understand, is an elaborate extension of the original German work, and is founded, in part, upon new manuscript materials discovered by the author in English town archives.

MORE FICTION.

Seth's Brother's Wife: A Study of Life in the Greater New York. By Harold Frederick. Charles Scribner's Sons.

Pine and Palm: A Novel. By Moncure D. Conway. Henry Holt & Co.

Old New England Days: A Story of True Life. By Sophie M. Damon. Boston: Cupples & Hurd.

Uncle 'Lisha's Shop: Life in Yankeeland. By Rowland E. Robinson. *Forest and Stream* Publishing Co.

Bledisloe; or Aunt Pen's American Nieces. An International Story. By Ada M. Trotter. Boston: Cupples & Hurd.

George Stalden: A Personal Memoir of the time of the American Revolutionary War. Edited by Edmund Lawrence. London: Remington & Co.

Major and Minor: A Novel. By W. E. Norris. Henry Holt & Co.

The New Antigone: A Romance. Macmillan & Co.

THE story of 'Seth's Brother's Wife' is rather a tame one, in spite of several elements which might, with proper treatment, have served to make it exciting. The incipient love affair between the young journalist and his brother's wife experiences a sudden collapse just at the moment which a more venturesome writer than Mr. Frederick would have seized upon as the one opportunity that the tale affords for strong work. It is, perhaps, just as well that he took the commonplace course of passing this critical point. By so doing he was sure to get into no difficulties, and was equally certain of bringing Seth's modest career to a decent and seemly stage of respectability, where one is content to leave him undisturbed along with the innumerable host of novel heroes who have settled down to spend their days in earning an honest living for an honest family. It is true that the righteous indignation which Seth shows towards his sister-in-law, when she believes he has murdered her husband and is thanking him for it, is only what one would have expected of any well-meaning young fellow whose life had been reasonably honest and pure. But the power of that character which one moulds for one's self through action and thought is so slightly apparent in him that, had his feelings and the result been exactly opposite, it would not have seemed unnatural or impossible. The easy and unprofessional way, too, in which the real murderer was discovered and caught, marks the loss of another opportunity on the part of the author. He might have introduced the ever-popular detective and a few chapters of mystery and subtile reasoning *à la* Poe with telling effect. In the place of these passports to the publisher, a matter-of-fact sheriff and a mere arrest and confession seem like a wilful waste of valuable materials.

The best part of the book, by all odds, is the chapters, evidently drawn from experience, which describe Seth's career as a journalist. The different persons in the office where he goes to work as a reporter are done with a firm touch, with a vigor and naturalness which can only come from a full confidence on the part of the writer that he has his subject well in hand. Although the newspaper office and Seth's life while serving his apprenticeship there form but an episode, there is nothing else in the story which comes near equalling it. One realizes that, after all, the larger part of the man's life is to be passed in such an atmosphere; that what little romance there was in his youth is to be rubbed off by daily contact with the Dents and Tylers and Workmans whom one meets everywhere in the struggle for existence; and also, speaking generally, that the most serious part of a man's life offers the slightest opportunities to the novelist. For surely, to the average man—the man one meets everywhere except in the majority of novels—the daily task which lasts through uneventful years is a more potent factor in fixing the values that he sets on life than the history, however harrowing or delicious, of the time between commencement-day and marriage.

We do not say that Mr. Frederick has erred by leaving his hero a commonplace newspaper man instead of making him a rascal, and thereby having an opportunity of trying his hand at tragedy; if he has made a mistake, it has been on the safe side. There is no ground, however, for accusing Mr. Conway of being too tame. He has not only made the most of his opportunities, but has taken care in constructing his story that there should be no lack of them. None there are, to be sure, such as a jealous husband conveniently murdered; but the number of lighter incidents sufficiently piquant to be momentarily interesting is almost embarrassingly large. In fact, about all one can say in praise of the book is that it is lively and engaging. It is too much like patchwork to be of any real value as literature, and shows evidence of having been too hurriedly written—though at the same time with a certain facility—to be of much worth as a preparation for better work.

The insight which one gets of a phase of civilization in America that has now nearly passed away, through such books as 'Old New England Days' and 'Uncle 'Lisha's Shop,' is well worth having. Even though the stories, considered merely as such, are without literary form or finish, and could more properly be called a collection of anecdotes, there is about them the spirit of the sturdy, honest simplicity which has for so long characterized the rural population of New England, and which makes one regret, in spite of Matthew Arnold, that the statistician is busy with noting its decadence and gradual absorption, while the realist novel-writer is describing its demoralization by the march of progress and the city boarders. It was a phase of civilization, it is true, which was far from perfect; there was much in it that was hard, and but little light or sweetness. Yet there was an independence, coupled with a neighborly helpfulness, about it, a morality which, while it was intolerant, was nevertheless sincere, and a respect if not an appreciation for higher things, for which, one sometimes thinks, the new and growing communities of the West to-day might advantageously exchange a portion of their push and energy.

One is prejudiced against 'Bledisloe' at the start by the claim, printed on the title-page, that it is an "international romance." Just what constitutes an international novel is perhaps as hard to determine as it is difficult to find the long-expected American novel. In the present case it seems to have been thought only necessary to have two American women of English descent returned to visit their relatives at a pretty little village on the Severn. While there they witness and in some measure assist the evolution of the stale old drama of the spendthrift father attempting to marry his beautiful daughter to an old but wealthy admirer, while her heart is breaking for the young Adonis who has nothing but his art to live on. This piece of stock in trade is enough to spoil the smoother and rather pretty love affairs of the American girls; but even were it left out, the novel would be only an ordinarily clever piece of work—a quiet chronicle of tennis, archery, runaway horses, mad bulls, and picnic excursions. The figure of Mr. Irwine was evidently meant to be after the grand type, and his action in preventing his wealthy rival from being dashed to death at the foot of a cliff is an example of pure heroism and great nobility. But novel heroes have done such very similar things so very many times before, that one is not sufficiently impressed either with Mr. Irwine's magnanimity or with the writer's originality.

It is unfortunate for Mr. Lawrence that one so readily recalls 'The Virginians' while reading the memoirs of 'George Stalden.' Two books could hardly be more unlike; but the mere fact that the story—and the story is, of course, the chief part of the memoirs—is laid in the same time with Thackeray's, induces one to make comparisons, and any modern novelist who invites a comparison with Thackeray is unfortunate. It makes no difference on what lines the parallels are drawn—whether it is the human interest awakened by the story, or the antiquarian interest evoked by the reproduction of a by-gone time—they reach the same end, and one's conclusion remains the same. This all may be said, however, without preventing the possibility of praising Mr. Lawrence's work for its own sake. It is painstaking, even, and scholarly. The slightly antiquated style is never obtrusive, and has a certain quiet charm of its own which helps a great deal towards making the book readable. It must be owned, though, that without the style and the interest of the time—a period especially appealing to the sympathies of American readers—the simple adventures and simpler romance of George Stalden would prove very dry material for the average novel reader.

Not so with either Mr. Norris's 'Major and Minor' or the romance of 'The New Antigone.' There is sensationalism enough and to spare in either of them. In Mr. Norris's novel this usually objectionable quality is so toned down by the presence of real people, and relieved by the genuine human interests which they have in common with other mortals, that one is ready to forgive it, especially as it enables one to get through the six hundred and odd pages of the book without too much of an effort. It may be true that the stories have all been told; but there is a perennial interest in some of them. The history of Brian Seagrave's love for Beatrice Huntley is certainly not new in its main features. One can hardly think of a novelist who has not tried his hand at least once on a

similar situation; but it always remains pleasing to read of a young fellow, who is in every way worthy and high-minded, loving hopelessly above his station, and finally being loved in return, and perhaps suitably rewarded. There is a sense of consolation for the young men readers in such a tale. And the young ladies, who, we are told, now form the chief audience for novelists, will always, one fancies, be partial to such a history; especially if it turns out as charmingly as Brian's affair.

As for 'The New Antigone,' it was cast in a large mould, but the metal has cracked in the cooling. The writer, who chooses to leave his name off the title-page, has evidently a very high opinion of the novel's place in literature. He has not only chosen great models, but he has also been at no lack of pains to do them justice—yet with rather poor success, one must admit. The romance which deals with rank materialism and bald socialism cannot but be unromantic; and the tragedy which is evolved from an actor's mere change of view can never have the force of true tragedy, nor evoke the sympathy which one feels for a noble mind struggling against an adverse fate.

SPANISH AND ITALIAN FOLK-SONGS.

Spanish and Italian Folk-Songs. Translated by Alma Strettell. With photogravures after sketches by John S. Sargent, Edwin A. Abbey, Morelli, and W. Padgett. Macmillan & Co. 1887. Sm. 4to, pp. xxi, 124.

THE noble ballads of the Spanish people are well known to the English reader through the spirited versions of Lockhart and Rodd; but the modern popular lyrical poetry of Spain is almost wholly unknown out of the country. And yet it is well worthy of attention, and has many interesting points of resemblance with the popular poetry of Italy. It was, then, a very happy thought of Miss Strettell to give a selection from the popular poetry of the two countries. Unfortunately, however, she has limited her choice of Spanish folk-songs to a single field, which, interesting though it be, is the least popular of all.

The two provinces of Spain which are the most prolific in popular poetry are Aragon and Andalusia. In the latter, side by side with the usual folk-songs, has sprung up in recent times a curious class of compositions known as *cantes flamencos*, or "gypsy songs." Just why the gypsies are called "Flemings" in Spain is not clear, but probably, like our "Bohemian" and "gypsy," it indicated the land from which the mysterious people seemed to come. The gypsies were expelled from Germany in the sixteenth century, and considerable numbers of them went over into Spain, where they were at first called *germanos*, and later *flamencos*. They found a congenial home in Andalusia, and there alone developed the songs which Miss Strettell has for the first time translated into English. The *cantes flamencos* as we now have them are not in the gypsy tongue, are of recent date, and in many cases their authors are well known and still living. They are not folk-songs in the true sense of the word, and at the present day are seldom heard outside of the *café-concert*. They are written in the dialect of Andalusia, which has been influenced somewhat by the gypsy language, and their character does not differ from the genuine Andalusian folk-song. In the words of a profound connoisseur of this class of poetry, "the *cantes flamencos* are in no wise to be regarded as a disfigurement of old, genuine gypsy poetry, but as Andalusian poetry which, chiefly in the language, has assumed a gypsy tinge."

The usual form of these poems is the popular stanza of four lines of eight syllables, with vowel rhyme (assonance) in second and third lines. Sometimes the first line is suppressed, and thus we have *soleares* or *soleás* (for *soledades*, from Soledad, the name of a woman to whom the music is due, and not from the prevailing melancholy character of the poems themselves) of three and four lines.

Miss Strettell's versions, we may say at once, are worthy of all praise for their fidelity to the contents of the original, and for their grace and spirit. The translator has, however, allowed herself certain liberties with the form which are not to be commended. We do not blame her substitution of the English rhyme for the Spanish assonance—that is perhaps necessary; but she has no right arbitrarily to change the length of the verse. So far has Miss Strettell gone in this that there is scarcely one of her translations which preserves the exact form of the original. For the Italian hendecasyllabic verse she substitutes the English verse of ten syllables with accent on the last, and for the Spanish eight-syllable verse she substitutes verse of four, six, seven, or ten syllables.

How interesting and strange these poems are, may be seen from even a very brief selection. Here are a few of the three-line *soleares*:

> "I crossed the churchyard lea,
> And even the rosemary
> Told thou wert false to me."

The original reads:

> "En er simenterio entré,
> Y hasta el romero me dijo
> Que era farso tu queré."

Death and the graveyard are constant factors in these poems.

> "Gypsy maid, when thou art dead,
> Let them with my very heart's blood
> Mark the gravestone at thy head."

> "To-day she passed me, lying dead;
> And when I saw how fair she was,
> A covering o'er her face I spread."

> "One moonlit night
> I saw the gravedigger, digging
> My grave in the silvery light."

> "I will die, that I may see
> Whether death can end this frenzy,
> This thirst for thee."

The same ideas are found in the four-line *soleares:*

> "Yestereven
> The dead-cart passed me nigh;
> A hand hung out uncovered—
> I knew her again thereby."

> "When I have lain ten years in death,
> And worms have fed on me,
> Writ on my bones shall yet be found
> The love I bore to thee."

Besides the *soleares*, the favorite form is that of the *seguidilla jitana*, so named to distinguish it from the Spanish *seguidilla*, which has an addition of three lines, called *estribillo*, that may be suppressed. The *seguidilla jitana* consists of four lines of six, six, eleven, and six syllables, with assonance in the second and fourth lines. A better division makes the lines of eleven syllables—two of five and six. Here are two in Miss Strettell's translation:

> "Go now, and tell the moon
> She need not rise to-night,
> Or shine, because I have my comrade's eyes
> To give me light."

> "Once, as I told my beads,
> While yet the dawn was red,
> I saw the mother of my soul come towards me,
> With arms outspread."

There are several other classes of the *cantes flamencos* which we have not time to mention here, but enough has been said to show how interesting a field Miss Strettell has opened to the English reader.

The second part of the book is devoted to the better-known Italian popular songs, two great classes of which, the *rispetti* and the *stornelli*, are well represented, and there is also a *vocero* or dirge from Corsica. The examples are taken, as was proper, chiefly from Tuscany and Sicily, the great centres of Italian folk-song. There are numerous examples of the flower-*stornelli*, the first line of which is the name of some flower, tree, or shrub, mentioned arbitrarily to furnish an assonance for the third line.

These are from Tuscany:

> "Pomegranate flower!
> And if these sighs of mine were flames of fire,
> The world would be consumed this very hour."

> "O cypress flower!
> Taper, light up above the thicket there
> To light my love, who passes at this hour."

> "Flower of the grain!
> The mill stands idle, tho' the wheel may turn;
> Love grows and we consume away in vain."

Only two are from Sicily:

> "Flower in the vale!
> The sun will show his face no more at all,
> Because he knows thy splendors make him pale."

> "Flower of the vine!
> Christ did forgive his enemies their sin,
> And do thou, dearest life, forgive me mine."

The make-up of the book is worthy of its dainty contents. It is bound in pale green silk, printed on what looks like hand-made paper, with very curious illustrations in photogravure from drawings by Sargent, Abbey, and others. The artists have reflected the weird spirit of the poetry. The process, however, is often vague to indistinctness. Altogether, in form and contents, the book is the most charming we have seen for a long time.

We cannot dismiss it, however, without observing that the reader, not to speak of the reviewer, has rights which the translator is bound to respect. Miss Strettell nowhere in her book makes any reference to the sources of her work. The reader might sometimes like to go a little deeper into the subject; the reviewer, if he is conscientious, will wish to compare the translation. Miss Strettell may have collected all her originals herself, or she may have used the work of others. As a matter of fact, the *cantes flamencos* may be found in the only collection of these songs which has yet been printed, 'Coleccion de Cantes Flamencos, recojidos y anotados por Demófilo (A. Machado y Alvarez)' (Seville, 1881). An admirable article on the subject by Dr. H. Schuchardt may be found in the *Zeitschrift für romanische Philologie*, vol. v, page 249. The Italian poems may be found, with one or two exceptions, in Tigri's 'Canti popolari Toscani' (Florence, 1869), and in Pitrè's 'Canti Popolari Siciliani' (Palermo, 1871).

LAYARD'S EARLY ADVENTURES.

Early Adventures in Persia, Susiana, and Babylonia, including a residence among the Bakhtiyari and other wild tribes before the discovery of Nineveh. By Sir Henry Layard. 2 vols. With maps and illustrations. Longmans, Green & Co. 1887. 8vo.

IT is now forty years since Sir Henry Layard published an account of his excavations in the mounds of Kouyunjik, the site of ancient Nineveh. Of this and the similar work at Babylon we need say no more than that the secret of his success, in the face of countless obstacles put in his way by Turk and Arab, was not so much a great zeal and persistence as his remarkable knowledge of the people and the methods of dealing with them. The manner in which he gained this knowledge, the veteran explorer and diplomatist at length reveals in these volumes. He was just twenty-two when, in 1839, he left England, with Mr. E. L. Mitford, with the intention of going overland to India, an undertaking at that time more formidable and perilous than crossing Africa is to-day. As his companion has recently published an account of this journey (strangely, however, omitting to mention Sir Henry's name), the latter begins his story at Jerusalem, where the two

separated for a time. The younger traveller, whose "youthful appearance" had caused Mr. Mitford some misgivings at the start, determined to visit the ruins of Petra, and from thence make his way to Damascus through the wilderness lying to the east of the Jordan. But the disturbed condition of the country, which was then occupied by the Egyptians, made this route, always a hazardous one, unusually dangerous, and Mr. Mitford was unwilling to risk the attempt. Sir Henry, however, persisted, and, accompanied only by a native of one of the Trans-Jordanic tribes, reached Petra without difficulty. But his journey northward from this place, which the rapacious Bedouins, who inhabited the caves, gave him no opportunity to examine carefully, was a constant succession of hardships. He escaped from the hands of one robber tribe only to fall into those of another. To add to his difficulties, the plague was raging in some of their encampments, and a cordon of soldiers guarded the approaches to Damascus to turn back all travellers from the south. But his unfailing courage, and a happy faculty for making useful friends, enabled him to overcome all hindrances, although he was stripped of nearly everything which he possessed. Eluding the guards at night, he reached the gates of Damascus in a condition very similar to that of Bedreddin, whom the genius laid sleeping at these same gates in the halcyon days of Haroun al-Rashid. Naturally, Sir Henry contrasts his entrance in this nearly naked state with his reception when, thirty-eight years after, he came as the British Ambassador to Turkey, and "vast crowds of men and women of all creeds" went out to welcome him. After a few days' rest in Damascus, he rejoined Mr. Mitford at Aleppo, taking Baalbek on his way. In the course of his later tour he went again to Baalbek, and found, to his great regret, that since his previous visit "many of the delicate architectural ornaments of the temple and other buildings had greatly suffered from wanton injury attributed to English and American tourists."

When the travellers reached Hamadan, in Persia, at which place the Shah was then encamped with his army, they found it impossible to obtain permission to cross into Afghanistan by way of Yezd and Seistan, as they had originally intended. Accordingly here they finally separated, Mr. Mitford proceeding on his journey to Ceylon through Herat, while Sir Henry, still cherishing hopes of being able to carry out their first plan, which included the tracing the course of the Helmund, turned southward to Ispahan. The Shah's camp was raised the day preceding his departure. "Before leaving the city the soldiers had pillaged the bazaars. All the shops were closed, and the inhabitants, dreading violence and ill-treatment, had concealed themselves in their houses. The gardens around the town had been stripped of their produce and the trees cut down. The place looked as if it had been taken and sacked in war. Such was the usual result of a visit from the Shah, his Ministers, and his army." On reaching Ispahan, Layard determined, while waiting for an opportunity to go to Seistan, to visit some remarkable ruins and inscriptions said to exist in the Luristan Mountains, on the western borders of Persia. For this purpose he applied to the Governor of the province for the necessary firman. This man, Manuchar Khan, the Matamet, as he was usually called, was a Georgian eunuch, whom great administrative abilities had raised from the lot of a slave to this important post. Although hated for his cruelty, of which some terrible instances are given, and though thoroughly unscrupulous in the means used to secure his ends, yet "it was generally admitted that he ruled justly, that he protected the weak from oppression by the strong, and that, where he was able to enforce his authority, life and property were secure."

His firman having been secured, Sir Henry joined a party of Lurs who were about to return to their mountain homes. He was warned that all these mountaineers were robbers, cruel, bloodthirsty, and treacherous, and that he risked his life in venturing among them. But, nothing daunted by this, the young traveller adopted the dress of his new companions, and made it his constant study to conform to their customs and to avoid offending their religious sentiments and prejudices. His outfit was very simple, consisting of a small carpet, a wadded coverlet, and a pair of saddle-bags, containing "a second shirt, a hammer and nails to shoe my horse, one or two books and maps, and a few necessary medicines." In money he had but £10, the Lurs insisting that he would "require none when with their tribe, with whom hospitality was a duty, and who would resent as an insult an offer of payment for it." Under their escort he made his way to Kala Tul, the residence of Mehemet Taki Khan, the head of the great Bakhtiyari tribe, who inhabit the mountains of ancient Susiana. This was a castle perched on a high mound in a narrow valley, not unlike a feudal stronghold of Europe, with towers, court-yards, and guest chamber over the entrance. Here, in the absence of the chief, the principal wife, "a tall, graceful woman, still young and singularly handsome, dressed in the Persian fashion, with a quantity of hair falling in tresses down her back from under the purple silk kerchief bound round her forehead," welcomed the young Englishman, who "was at once captivated by her sweet and kindly expression." He was equally attracted to her husband, a man of about fifty years of age, of middle height, with a very noble air and "the very beau-ideal of a great feudal chief." By his courage and abilities he had acquired almost sovereign power over a large territory, and "was famed throughout Persia, as well as in his mountains, as a dauntless warrior, a most expert swordsman, an excellent shot, and an unrivalled horseman." His followers were worthy of their chief, "a splendid race, far surpassing, in moral as well as in physical qualities, the inhabitants of the towns and plains of Persia."

Sir Henry gives a very attractive picture of his life among this people, whose gratitude he won at the outset by successfully treating the eldest son of the chief for a dangerous fever. The days were spent in hunting or in exercising horses, the evenings in conversation and in listening to recitations of poetry, of which the Bakhtiyari are passionately fond. He also made excursions, not unaccompanied with danger, to remote places among the mountains in search of ruins and inscriptions. After several months spent in these occupations, the Matamet appeared in the valley with an army, ostensibly on a visit of courtesy, but really for the purpose of seizing Mehemet, whom the Shah regarded with great suspicion and jealousy on account of his power. The Englishman was not an unconcerned spectator of the exciting events which followed, but chivalrously devoted himself to the cause of the mountain-chief, though bringing himself thereby again and again into imminent peril. When the Persian demanded the eldest son of Mehemet as a hostage, Layard was sent with him. Hussein was ten years old and "one of the most beautiful boys I ever saw, and the very picture of a young warrior." When brought into the presence of the Matamet the latter asked him sternly, "'Why have you not brought your father with you? Is he not coming to Shuster to see me?' 'No,' replied the boy, with an undaunted air, his hand resting on his gun. 'What if I were to send those soldiers' (pointing to the horsemen careering in the plain beneath) 'to fetch him?' rejoined the Matamet. 'Let them go to Kala Tul,' answered Hussein Kuli, grasping his dagger. 'They will all come back naked, like this,' putting his forefinger into his mouth and then withdrawing it and holding it up, a significant gesture employed by the Bakhtiyari to denote that they have stripped a man to his skin." Mehemet was compelled to leave his mountain fastnesses and to take refuge in the swamps of the delta of the Euphrates-Tigris, whither Layard followed him, the latter part of the way floating down the Karun on a raft of reeds, having been robbed and abandoned on its banks. The unequal struggle between the Persian Governor and the mountain chieftain could have but one ending. The latter was treacherously taken prisoner, and, a daring attempt to rescue him in which Layard joined having failed, was carried to Teheran, where he died in 1851.

Layard, in an endeavor to secure an asylum for his family in their native mountains, was captured, but escaped, though his only companion was murdered. After great suffering from the scorching heat of the plains, over which he wandered for several days, he reached Shuster. There he had an interview with the Matamet, who naturally reproached him for the risks which he had run. "'You Englishmen,' he added, in an angry tone, 'are always meddling in matters which do not concern you, and interfering in the affairs of other countries. You attempted to do it in Afghanistan, but all your countrymen there have been put to death; not one of them has escaped.' He then described the ignominious manner in which the corpse of Sir William MacNaghten had been treated at Caubul, and the insults heaped upon the bodies of other English officers." As this was several months before the massacre actually occurred, the Matamet apparently had information of the intended extermination of the English, and supposed that it had already been done. From Shuster Sir Henry made his way with great difficulty and several hair-breadth escapes from Bedouin robbers to Bagdad, which he reached, after a year's absence, bareheaded and with naked feet, clad only in a tarbush and abba, an Arab shirt and cloak.

While waiting for letters from England, he went again to the mountains, partly to visit some ruins which the disturbed condition of the country had prevented his examining before, and partly to learn the fate of his Bakhtiyari friends. The most interesting part of this excursion, which was not without exciting adventures, was his visit to Dizful, a famous fort on the summit of a hill, whose almost perpendicular sides could only be scaled by means of ladders and ropes. On his return to Bagdad, he accompanied Lieut. Selby in the steamer *Assyria* in an exploration of the rivers Tigris and Karun, which very nearly had a tragic ending in a hostile encounter with the Arabs, Lieut. Selby being wounded. At this time, Layard's purpose to go to India being finally abandoned, he went to Constantinople with despatches for Sir Stratford Canning, then British Minister to Turkey.

The concluding chapters give graphic pictures of the "Great Elchi," and his methods of dealing with the Sultan and his ministers, and of life in Constantinople at that day. Layard was employed by Sir Stratford in various pri-

vate missions, which he discharged in such a manner as to win the Minister's confidence. Among other things, he was sent to Thessaly and the Balkan provinces to get information as to the state of the country. A revolution was in progress in Servia, and in order to carry important information to Sir Stratford he rode post from Belgrade to Constantinople in less than six days, a journey of 600 miles, which he performed "in less time by some hours than Col. Townley, a Queen's messenger, whose Tatar ride over the same ground had been mentioned by Lord Palmerston in the House of Commons as the fastest on record." His adventures, which were remarkable both for their number and variety, ended with a mission to northern Albania, where there was a serious rising against the Turks. At the request of Omar Pasha, the commander of the troops sent to put it down, Sir Henry visited the insurgent camp as a mediator. One of the most striking passages in the book is his description of a dance of the Ghegas, on the night of his arrival in camp, in which some hundreds of them moved "round with measured steps to the sound of drums and oboes, stamping their feet and swinging their arms to and fro," while others held torches or brandished swords and raised their war-cries.

It is a pity that Sir Henry Layard, for his own reputation, should have delayed so long the publication of these singularly interesting volumes, which were written, substantially as they are printed, many years ago. Not only would they have put him in the front rank of Asiatic travellers, but it is not unlikely that his accounts of the Bakhtiyari might have led to some efforts for the amelioration of their wretched condition. Making all allowances for the young man's enthusiasm, they are far the most interesting people of Central Asia of whom we have ever read. Sir Henry's style in the first part of his work is a little dry, but grows more animated as he proceeds, and there are few readers who will not follow with absorbing interest and sympathy the fortunes of Mehemet and his charming wife Khatun-jan, "Lady of my Soul." The maps are not such as one would expect to find in a work of this character, and it is with considerable difficulty that the author's route can be traced upon them.

A MODERN KNIGHT ERRANT.

Richard F. Burton, K.C.M.G.: A Biography. By Francis Hitchman, author of 'The Public Life of the Earl of Beaconsfield,' etc. 2 vols. London: Sampson Low & Co. 1887.

SOMEBODY or other once described the human race as consisting of men, women, and clergymen. "Explorers," however, constitute a fourth class having a distinct claim to a place of its own apart from the others. An insatiable curiosity as to the life led in the unknown and waste places of the earth acts like a goad upon the mind of the explorer. He wanders, by choice, among the most brutalized portion of humanity, for, as Sir Richard Burton points out, the "explorer" is not to be confounded with the traveller. The latter journeys over a beaten track; the former is the forerunner of the traveller. It is the pride and glory of the explorer to penetrate whither the foot of civilized man has not preceded him. The security of civilization is an offence to this roving habit of mind. In the great army of explorers Sir Richard F. Burton must always hold a distinguished place, and Mr. Hitchman has done well to collect within a reasonable compass the long story of his wanderings. At the same time, we wish that he had dwelt more upon the man and less upon the details of his journeys. He has given us two thick volumes about Sir Richard Burton, and calls his work "a biography"; but of Sir Richard Burton himself he conveys but a vague and indefinite impression. Burton began life as an officer in the army of the East India Company, landing at Bombay on October 28, 1842. His Indian career was brief, lasting only seven years, but is remarkable for the perseverance with which, after the manner of the true explorer, he pursued his researches into the unknown. To nineteen-twentieths of the young Englishmen who go to India, the land of their adoption has absolutely no interest except as a hunting ground or a shooting preserve. If the rules of the service did not peremptorily demand a certain knowledge of the language, there are only a few who would acquire enough to converse even with their servants. As to going one step beyond the limit enforced by the Government, it is safe to say that even the thought of so insane an enterprise does not enter the head of one Anglo-Indian official out of every five hundred. Burton's practice was in marked contrast with this routine. In the brief space of seven years he passed examinations in six of the native languages, and had acquired a considerable knowledge of two others. He applied himself with so much zeal and devotion to the study of the mysteries of the Hindu faith that his instructor—a strict Hindu—invested him, so he declares, with the "Brahminical thread." He also became so proficient in the Sikh religion and literature, that here, also, his instructor solemnly initiated him (we presume, though he does not expressly say so) as a member of the "Khalsa." What was the exact value attaching to these ceremonies we cannot say. To invest a man with the "Brahminical thread" is to confer upon him the spiritual rank of the "twice-born"—a dignity which is not in the power of flesh and blood to confer, and which we cannot conceive of a Brahmin even pretending to confer upon a stranger and an outcast.

Arabic, however, appears to have been Burton's favorite study:

"Under Shaykh Háshim," he writes, "I began the systematic study of practical Moslem divinity; learned about a quarter of the Koran by heart, and became a proficient at prayers. It was always my desire to visit Mecca during the pilgrimage season. Written descriptions by hearsay of its rites and ceremonies were common enough in all languages, but none satisfied me; moreover, no one seemed practically to know anything about the matter. So to this preparation I devoted all my time and energy, not forgetting a sympathetic study of Sufism, the gnosticism of Al-Islam, which would raise me high above the rank of a mere Moslem. I conscientiously went through the Chillá or quarantine of fasting and other exercises, which, by the by, proved rather too exciting to the brain."

In reading his account of these portentous labors we must confess to a feeling that Sir Richard Burton has unconsciously been led into over-statement. The brief period of seven years would hardly suffice for the study of a single Oriental religion. In the case of Sir Richard Burton, if we are to accept his account precisely as it stands, it was sufficient for the study of eight languages, for a searching investigation into the mysteries of three creeds, for the discharge of official duties, for a number of journeys over unfrequented parts of India, and for a considerable quantity of sickness. All this, it seems to us, is a good deal more than could be crammed into the time even if Sir Richard could have dispensed altogether with eating, sleep, and recreation. It is clear, however, from the success with which he accomplished the pilgrimage to Mecca, undertaken immediately after leaving India, that his instructor, the Shaykh Háshim, must have succeeded in converting him into a very correct semblance of an orthodox Moslem. At the end of this, his first, and perhaps his most remarkable adventure, Sir Richard expressed his opinion that the results were not worth the sacrifices they had entailed. We are entirely of that opinion. Setting aside the danger, the appalling physical discomfort and hardship, Sir Richard had to play during the whole of this trying time the part of a devout Moslem. He had to visit shrines without number; to engage in prayer an incalculable number of times; to be, in a word, in a perpetual state of make-believe. And without entering into the casuistry of the matter, it is impossible to exaggerate the wearisomeness, the inward disgust and loathing, engendered by long persistence in such an anomalous attitude.

Few men, at the same time, accustomed to the milder ways of civilized life, could have lived through the hardships of this dangerous adventure. It began with a voyage from Suez to Yambú, in a small, crazy ship crammed as full as it could hold with a crowd of savage and filthy pilgrims from North Africa.

"Within this comfortless craft" (this is Burton's description) "no fewer than ninety-seven unhappy pilgrims with their baggage were remorselessly packed, while fifteen women and children were crowded into the cabin. Their manners were rude, and their faces full of fierce contempt or insolent familiarity. A few old men were there, with countenances expressive of intense ferocity; women as savage and full of fight as men; and handsome boys with shrill voices, and hands always upon their daggers. The women were mere bundles of dirty white rags. The males were clad in burnús, brown or striped woollen cloaks with hoods; they had neither turban nor tarbush, trusting to their thick curly hair, or to the prodigious hardness of their scalps, as a defence against the sun; and there was not a slipper nor a shoe among the party."

The voyage in this agreeable company lasted twelve mortal days. The discomforts are not to be described, and on some occasions even the hardened Arabs and Africans, who, by Burton's account, are capable of enduring almost any extreme of hardship, suffered most severely.

Africa was the scene of the larger portion of Burton's adventures; but he travelled largely in Asia also, and the scenes and peoples through which he passed he has described in a series of volumes that contain the most minute and varied pictures of savage life ever drawn by a denizen of the civilized world. If there is anybody anywhere who still retains a lingering belief in the reality of "the noble savage," they should be referred to any one of these volumes in order to be disabused of it.

Burton's life of peril and adventure was ended by landing him in the obscure harborage of a consulate at Trieste. Mr. Hitchman is full of indignation at the want of official appreciation for his hero which is disclosed by this circumstance. He ought, however, to take comfort. If Sir Richard Burton had been the kind of man to work easily in official harness, there would have been no occasion for the composition of the volumes under review. Official promotion depends upon a belief in the sanctity of official routines and the virtues of official superiors. That Sir Richard Burton has no particle of this saving faith in his constitution is very abundantly illustrated by the liveliest episode to be found in these two volumes. During the Crimean war, Burton, zealous as always in pursuit of adventure, became an officer in the force of Bashi-bazuks which General Beal-son of the Indian Army was at that time commissioned to raise. This experience of his is, perhaps, the only one which he had omitted to

describe in print. The omission is now made good by a chapter written by himself, and which appears in its proper place in Mr. Hitchman's work. It is a very lively, amusing, and vigorous piece of autobiography, but plain-spoken to a degree. In Burton's deliberate opinion, there was not a prominent man, French or English, connected with this war, who was not knave or fool, except in those rarer cases where he was a combination of both. It may be that Sir Richard is right, but this contemptuous estimate of the men placed in authority over him has been, we fancy, a characteristic of his through life; and when this happens, the superiors, naturally enough, fail to perceive the merits of their too free-thinking critic. Conventionality in all its phases has, through life, been abhorrent to Mr. Hitchman's hero. He has, in all times and places, said what he thought, and done what he wished to do, regardless of the susceptibilities of others or the consequences to himself. This indifference to others' opinions, this disregard of consequence, has made him a great and successful explorer, but are not the qualities which lead to prosperity and promotion in a State department.

The Condition of the Working Class in England in 1844. With appendix, written in 1886, and preface, 1887. By Frederick Engels. John W. Lovell Co.

Arcady. For Better for Worse: A Study of Rural Life in England. By Augustus Jessop, D.D. G. P. Putnam's Sons. 1887.

As the Roman Emperor in his triumphal procession was accompanied by a slave to remind him that he was mortal, so to the prosperous and comfortable citizen of to-day there comes from time to time a wail out of the depth of poverty and misery, saddening his enjoyment with the consciousness of terrible suffering among his fellow-creatures, which yet he is powerless to relieve. The success of Mr. George's 'Progress and Poverty' was less owing to the actual merits of the book than to the fact that, after rehearsing in tones of deep compassion the pitiful story, he announced himself as the prophet of a new gospel, and promised a specific which would at least open the way to ultimate relief from the heavy burden of the world. It was not only the poor who caught eagerly at the flattering hope, but thousands upon thousands of those who, themselves beyond fear of want, find their lives darkened by despairing sympathy.

Mr. Engels is not less confident than Mr. George that the universe would be all right enough if only he could have the ordering of it. He is a Socialist, pure and simple. "Now the Socialists of the school of Marx, too, demand the resumption by society of the land, and not only of the land, but of all other means of production likewise." Mr. Engels is not disturbed by the vast development of machine-power and factory life. He dwells with all the glee of an economist upon the number of spindles, the pounds of cotton yarn, and the yards of goods, the output of coal, and the increase of population of towns. The trouble is, that the advantage accrues to the capitalist, by whom the laborer is ground down. All would be well if only the State would manage the factories, and mines, and railroads, and distribute the proceeds equitably among all concerned. And then follows, through two hundred pages of fine print, a catalogue of past horrors so awful as to form a pretty hard strain upon credulity. And yet, after all this demonstration of the need of some prompt and decisive interference, the reader finds the main problem still unsolved, whether such action by the State, even if possible, would not do more harm than good.

It is a comfort to turn from such a picture to the cheery and practical narrative of Dr. Jessop. Having held a curacy in the east of England for seven years, and then lived in a city for twenty-five years, in 1879 he was again presented to a benefice in Norfolk. He sets himself to compare the present condition of the agricultural population with that which he knew in years gone by. After speaking of the classes above, he finds that "the laborer of to-day is a great deal better off than his father was, *with one notable and shameful exception.* His children are cleaner, better taught, better looked after, better dressed than they were; his wife is no longer the poor drudge she almost invariably became after her fourth or fifth child; she has her perambulator, and, in many instances, her sewing-machine; she even talks to you of her dressmaker." The exception referred to is in the matter of lodging, of which he gives a melancholy picture, and, as a consequence, of the decline in female purity. Another gain is, that whereas the laborer used to be always in debt, he now has more money, is much sharper about it, and as a rule pays his way. On the other hand, the laborer's life has had the joy taken out of it:

"There are scores, perhaps hundreds, of villages where the inhabitants have absolutely no amusements of any kind outside the public house, where cricket or bowls or even skittles are as unknown as bear-baiting, where the children play at marbles in the gutter in bodily fear lest the road surveyor should come down upon them."

These two evils, bad lodging and absence of occupation, drive off the young men; and all who can, either emigrate or go to the towns, leaving agricultural labor both scarce and of poor quality. Another change is, that while the laborer of fifty years ago drank a good deal of beer and cider at the farmhouses, he never tasted gin or other strong liquor. Now the facilities for drunkenness have largely increased. Dr. Jessop is no such Utopian as George and Engels, and discusses calmly and practically what can be done, though even so his views are hardly more encouraging. His book is very readable, being enlivened with anecdote and studies of character, and is especially interesting as a picture of life very different from anything in this country.

English Newspapers. Chapters on the History of Journalism. By H. R. Fox Bourne. 2 vols. London: Chatto & Windus. 1887.

Mr. Fox Bourne has long established his reputation as a diligent and successful investigator of the unfrequented byways of history. Passing by his biographies of John Locke and Sir Philip Sidney, few books of our day are fuller of quaint and instructive information than his 'English Seamen under the Tudors' and his 'British Merchants.' His "Chapters on the History of Journalism" are a capital addition to his former contributions to a like line of research. The subject is full of interest, and leads an inquirer, by way of natural necessity, down all manner of obscure passages, and into queer nooks and crannies innumerable. The history of the English press falls into two clearly defined divisions—the period of the press militant and the period of the press triumphant. It cannot be denied that the former is much the more interesting of the two. In a sense it might be maintained that the press was then even more powerful than afterwards, when it had successfully vindicated its right to existence and freedom of speech. After the Revolution of 1688, from which date the political power of the press may be said to have begun, the constituency to which it appealed was concentrated in a single small area, to wit, "the town." The opinion of "the town" was, in fact, the public opinion of the United Kingdom. A telling article passed at once, like an electric current, through all parts of "the town," with fear of change greatly perplexing monarchs and politicians. The promptitude and certainty with which an effect was produced naturally attracted a number of powerful writers to make use of the press as an engine, and a glance through the pages of Mr. Bourne's first volume will show that no inconsiderable portion of the standard literature of Great Britain first saw the light of day in the columns of a struggling press. Defoe, Swift, Steele, Addison, "Junius," Johnson, Burke, Coleridge, are only a few of the great names closely connected with the press during this its militant period, and so attractive are the associations suggested by these names that their simple appearance in a printed page seems to invest it with interest.

Mr. Bourne has, of course, much more to do with them than merely to mention them. The particulars which he gives respecting Defoe and Coleridge are especially interesting, and he has printed almost *in extenso* the article in the *North Briton* that caused the war between John Wilkes and the constitutional authorities, in which the latter were so completely and ignominiously defeated. This period of conflict, adversity, and final triumph brings out in a very striking way the bulldog tenacity of the English character. Prosecution, fine, and imprisonment were until the beginning of the present century the normal diet, one might almost say, of an honest and independent editor. If he refused to succumb to the corrupting allurements of the authorities, he was certain to be attacked by assault and battery. Before the Whig Revolution he was even worse off. He was not infrequently hung; he was constantly placed in the pillory, and he was liable at any moment to endure excision of the ears. There is no instance, we think, of an editor being executed or mutilated after 1688, but, until the peace of 1815, and, indeed, for some time after, his calling remained a highly precarious one. Cobbett left the country and retired to America rather than face the danger of it. The brothers Hunt, so late as 1813, expiated an uncomplimentary article on "The First Gentleman in Europe" by two years' imprisonment and a fine of £1,000. The very dangers, however, which beset the profession were a testimony to its power, and this power was, in its turn, strengthened and extended by the ability of the men who wrote either as editors or contributors. True it is that when a Defoe, a Swift, a "Junius," or some other great author was not writing, the press sank very rapidly to mere scurrility and abuse; but this, so far from diminishing, greatly enhanced the effect of the powerful and thoughtful writing whenever it appeared.

It is this struggle, between the State on the one side and the press on the other, which makes the early history of English journalism as exciting as a sensational novel, and Mr. Bourne has told the story in a graphic and vigorous fashion. But when journalism, emerging victorious from the long conflict, becomes a coördinate authority in the government of the country with the Crown and the Legislature, its history becomes more prosaic and a great deal less interesting. The daily paper has now become a great commercial venture, in which every other consideration has, perforce, to be subordinated to the financial one. It is not strange, therefore,

that the latter part of Mr. Bourne's "Chapters" should not be so full of interest as the earlier. The fault lies, not with him, but in the nature of the subject. It is not in the power of mortal man to invest Mr. Delane with the interest which surrounds the author of 'Robinson Crusoe,' or to make his readers care as much for Mr. Edmund Yates and Mr. Henry Labouchere as for Mr. Addison or Sir Richard Steele. At the same time, all that portion of Mr. Bourne's book which deals with the modern London press is a perfect mine of information on the subject. Especially curious is it to note how the power of the London papers, in relation to the counties, rose with the expansion of the railways, and declined as rapidly with the rise of the electric telegraph. It is the latter discovery which has put an end to the London press setting the tone of political thought in the counties. The telegraph, by outrunning the railway, enabled the provincial press to anticipate the London press in items of news concerning which, so long as railways were the sole means of communication, the London press had anticipated them. Hence the rapid and enormous development of local papers in the great manufacturing centres and elsewhere. The British press, as an advertising and news-collecting agency, is at the present moment in the zenith of its greatness—one of the wonders of the world.

The Holy Land and the Bible. A Book of Descriptive Illustrations gathered in Palestine. By Cunningham Geikie, D.D., Vicar of St. Martin's at Palace, Norwich. 2 vols. James Pott & Co. 1888.

The title of this work naturally reminds one of Thomson's 'The Land and the Book.' And there is also considerable resemblance in the aim, the plan, and the execution. Like Dr. Thomson, though not as often and as long as he, Dr. Geikie journeyed through Palestine "gathering illustrations of the sacred writings from its hills and valleys, its rivers and lakes, its plains and uplands, its plants and animals, its skies, its soil, and, above all, from the pictures of ancient times still presented on every side in the daily life of its people." Richness of detail, vividness of observation, and naturalness in sketching characterize both works almost alike. But there is more pious naïveté in the older writer's pages, more evidence of study and book-learning in those of the younger. Geikie's production is by far less original, but much more systematic and complete. He can justly claim that "all the country is brought before the reader in successive portions, from the extreme south to its northern limits—that is, from Beersheba to Damascus, Baalbek, and Beirout." And man and his habitations, soil and atmosphere, fauna and flora, are minutely depicted, with all their peculiarities, ancient and modern. All Bible history is illustrated, and almost repeated, in pointed analogies and contrasts. In a certain sense, the book is a Bible dictionary, made handy as such by its full index. And yet it has the freshness of a book of travels. Descriptions like the following of a spring scene in Sharon are not infrequent:

"As we rode on, many peasants were ploughing, with the plough in one hand, and in the other a long wooden goad, the sharp iron point of which was used to urge forward the lean, small oxen. . . . The plough used was so light that it could be carried on the shoulder; indeed, asses passed carrying two ploughs and much besides. . . . Ravens and wild doves flew hither and thither. Herds of sheep were feeding on the thin pasture, but cattle were rare. The sheep had great broad tails, and thus seemed to be the same breed as that reared by the ancient Jews, for we read that the tail of their variety was burned by the priests on the altar, in thank-offerings. . . . On the roofs of many of the mud houses grass had sprung up plentifully, thanks to the winter rain, but in the increasing heat it was doomed to 'wither before it grew up.' On every side the landscape was delightful. 'The winter was passed, the rain over and gone; the flowers were appearing on the earth; the time for the singing of birds had come, and the voice of the turtle was heard in the land; the fig tree was putting forth her green figs, and the vines, now in bloom, gave a good smell.' Not that songbirds were to be heard, except the lark; there was not enough woodland for them; nor that the turtle was to be heard on the plain, or the fragrance of vineyards inhaled. These were the attractions of rare and isolated spots, beside the villages, on the hill-slopes. The plain itself is silent, and shows very little life of any kind."

The comparing of things seen with things Biblical—sometimes also in the manner of "lucus a non lucendo"—is here and there carried to excess. Thus, speaking of the crushing loads often carried by the Eastern porters, the traveller adds: "They remind us of the heavy burdens, and grievous to be borne, to which our Lord compares the spiritual slavery under which the Pharisees laid the common people. Perhaps the 'atals' of Christ's day supplied the illustration." Identifications of modern localities and characteristics with ancient ones are occasionally introduced on very flimsy grounds, as, after Guérin and Conder, on pages 48 and 52 of volume i, where the notes attached show the author's own strong doubts as to the soundness of the conjectures. That nothing calculated to put in a clearer light the correctness of Biblical statements is ever omitted, whether found in nature or in a book, need hardly be stated. Exceptionally, however, even this author's bibliolatry yields to facts, as when, speaking of the cony of Scripture, with distinct reference to Lev. xi, 5, he says (vol. ii, p. 90): "The Jews, who were not scientific, deceived by the motion of its jaws in eating, which is exactly like that of ruminant animals, fancied it chewed the cud"—in disregard of the circumstance that the Scriptural statement that "the cony . . . cheweth the cud" is given as one which "the Lord spake unto Moses." Possibly it was only an oversight which prevented Dr. Geikie from trying to identify the *shāphān* of the Hebrew text with some ruminating animal. On what authority he assumes (vol ii, p. 404) that the name Sirion signified "the Banner," while the same word as a common noun undeniably signifies *breastplate*, we are unable to discover.

A Bibliographical Account of English Theatrical Literature, from the earliest times to the present day. By Robert W. Lowe. New York: J. W. Bouton.

We announced Mr. Lowe's book a year or two ago with hope, and we receive it now with gratitude. It is one of the most useful volumes ever prepared for the student of stage-history; perhaps it would not be too much to say that it is *the* most useful of these. It takes its place at once on the shelves of the dramatic collector by the side of the 'Biographia Dramatica,' Geneste's 'History of the Stage,' and Mr. Ireland's 'Records'; it is as indispensable as any of these, and it is more exact, fortunately, than the 'Biographia Dramatica,' and more orderly in arrangement than the worthy Mr. Geneste's work. Mr. Lowe has tried to give us here a list of all the books about the stage published in England. He does not catalogue plays, and the immense mass of Shaksperiana is also omitted; but histories of the theatre, biographies and autobiographies of actors, managers, and dramatists, books of criticism and of gossip, libellous pamphlets and satirical poems, treatises on acting and essays on the art of the stage—these Mr. Lowe has sought out and set down in strict alphabetical order, and with the utmost amplitude of cross references. Theatrical newspapers and dramatic magazines have their rise and their fall recorded in his pages. The richness of the material thus collected may be gauged by the fact that there are seventeen entries under Betty (the Infant Roscius), twenty-six under Colley Cibber, twenty-eight under Jeremy Collier, thirty-four under Foote, ninety under Garrick, eighteen under Henry Irving, twenty-eight under Edmund Kean, and twenty under Richard Brinsley Sheridan.

He was a wise man who said that "if you want to have the pride of accuracy taken out of you, print a catalogue," and we will not venture to declare that Mr. Lowe has made no erroneous omissions; we may even suggest that Mrs. Kemble's 'Notes on Some of Shakspere's Plays' should have been included, because it contains her brilliant and aggressive lecture "On the Stage." And the rigorous exclusion of books printed in America has resulted in some strange voids: for instance, although there are two entries under Fennell, his remarkable autobiography is not one of them. In like manner, though the English publications about Junius Brutus Booth and John Howard Payne are duly catalogued, it is with regret that we mark the absence of the more abundant American matter. No doubt, the line had to be drawn somewhere, and perhaps Mr. Lowe was right in recording no book not published in the United Kingdom. After all, these criticisms seem almost hypercritical when we consider again the many solid merits of the book. To use a commonplace, Mr. Lowe has done very well what was very well worth doing; and he deserves the thanks of all who know how hard his labors have been, and who shall hereafter profit by the results of them.

A certain piquancy not often observable in bibliography is to be discovered by any one who is familiar with a very sarcastic pamphlet called the 'Fashionable Tragedian' and directed against Mr. Henry Irving. This was published anonymously ten years ago, but we find it here set down as the work of Mr. Lowe himself in collaboration with Mr. William Archer. But none the less has Mr. Lowe dedicated his book "to Henry Irving, whose genius and achievements have so powerfully promoted that revival of interest in matters dramatic to which it owes its existence."

La Guerre de Sécession. 1861-1865. Par Ernest Grasset, Inspecteur-en-chef de la Marine. Deuxième Partie. Les Hommes. Paris: L. Baudoin et Cie.; New York: Christern. 1887.

We have here a series of very clever sketches of the principal figures in our late civil war. As a rule, they are remarkable for justness of appreciation and facility of expression. That the men are viewed from the standpoint of a Frenchman, adds to the curiosity and interest with which we turn over the pages. In the first part of his book, M. Grasset has sketched the course of events; here we have his characterization of the actors. Many of his pictures are exceedingly good; those of Grant, Farragut, Meade, Butler, Burnside, may be, perhaps, especially cited.

Not infrequently we are made to see both sides in a fashion to which we are somewhat unaccustomed. Take this, for example, from the sketch of Grant, where our author is contrasting him with Lee:

"Robert Lee . . . possessed all the virtues of private life, all the qualities of a

public man; he was infinitely superior to his adversary; his troops were admirably handled. The patriotism, remarkable as it was, of the loyal States, was surpassed in the South. There, everybody took part in the common work; women, children, old people, all gave something; some their blood, some their gold, others their labor. Notwithstanding this marvellous enthusiasm, which lasted four long years, this party succumbed. The vanquished General approached in genius the great captains of the world; the conqueror did not exceed the average of men of talent. He that was the less endowed by nature triumphed. Sprung from the people, he has their good qualities and their defects—the patient courage, the implacable resolution, the unpolished rudeness. Plebeian by birth, by education, by manners, he is the synthesis of twenty millions of men gathered around the flag of the Union. Grant does not manœuvre—he conducts a crusade; he directs an invasion. The tide rises, and overwhelms the defenders of Richmond. The man acts like a ram; he lowers his head and finds his skull so hard as not to be broken by the shock.

"'The Lieutenant-General does not count his losses,' they write of him in May 1864; 'he has not the time to bury his dead.' Here, in a couple of lines, is a portrait to the life. The Unionist chief does not calculate; he is a hammer, always striking, redoubling his blows, despite of blood, conflagration, ruin. Not being able to defeat his adversary, he destroys him by degrees, a little each time; despairing of conquering Virginia, he systematically devastates it. 'I will fight on this line if it takes all summer,' he writes to the Secretary of War. And the President believes in him; the Secretary of War approves of him; the country blindly follows this general, by whom, in a single month, the army has been reduced by one-half. There are no criticisms on these encounters, so terrible and so useless; no one of Grant's wishes meets opposition from any quarter. Lincoln, so original, so restless, will not allow himself to pass upon the campaign; he discerns final victory at the end of this bloody path."

Jefferson Davis has evidently interested greatly our foreign critic. He recounts his early career; his gallant conduct at Monterey and Buena Vista; his sagacious foresight that secession meant war. But M. Grasset is not blind to Davis's limitations:

"The incursions of Jefferson Davis into the domain of military affairs are always unfortunate. The two invasions of Maryland are due to his suggestion, against the advice, clearly given, of the General-in-Chief;* the weakening of the army of the West on the eve of Murfreesboro belongs entirely to him, as does also the sending of Longstreet to Knoxville after Chickamauga. It is, moreover, he who, in the last year of the war, retains his desperate clutch on Richmond, which Lee desires to abandon. His choice of instruments is no wiser than his choice of plans. He slights J. E. Johnston, he fails to make use of Kirby Smith, but he invents Hood, Braxton Bragg, and Pemberton, the men who are responsible for the surrenders of Atlanta, Chattanooga, and Vicksburg, the three mortal wounds of the Confederacy."

Yet we are not allowed to forget the strength and endurance with which the Confederate President bore up against a constantly increasing weight of misfortune and responsibility:

"On all other points his judgment and his dexterity are admirable. No disaster disheartens him; sad, but not discouraged, he renders to Congress his account of reverses, and indicates the proper measures to repair them. Adversity makes Jefferson Davis only the more inflexible. He defies the imminent bankruptcy, the destitution of the soldiers, the increasing number of desertions. The semi-official journal, the *Sentinel*, talks of war to the knife in the last town to which the Administration may be driven, with the last company that keeps the field under the Confederate colors. Sherman, 'the Attila of the South,' has driven back the army of Georgia—this is nothing; he is marching to his own ruin. Johnston is too prudent; Hood will restore our affairs. Atlanta falls; it is a misfortune, certainly, but one which can be repaired; Hood is about 'to flank the great flanker,' and to call him back whence he came. News comes that Sherman is penetrating the heart of Georgia; he will only find there his 'retreat from Russia.' Savannah has just fallen into the hands of the Federals; but what, in fact, was Savannah? Only an inconvenient rival of Charleston!"

Perhaps we have quoted enough to show M. Grasset's familiarity with his subject. But this portrait of Meade, to whose character and genius public attention has so recently been drawn by the unveiling of his statue in Philadelphia, cannot fail to be of interest to many old soldiers of the Army of the Potomac:

"Tall, slenderly built, of graceful figure, with the slight stoop of a man of books, with manners most attractive, but stamped with great dignity, he inspires confidence and repels familiarity. He is not a 'beau' like Burnside, a seeker for popularity like Hooker, a political candidate like McClellan. Of a complex nature, he unites something of the courtesy of the first with the frankness of the second and the sagacity of the last, possessing besides the solid bravery of all three."

Of Meade at Gettysburg it is said:

"The man of study has disappeared; there remains only the army commander, who comprehends the gravity of the situation, and, preserving all his self-control, faces it with calmness. He shows much more intelligence about military matters than his predecessors Burnside and Hooker; his corps are all engaged; they carry help to one another, changing their position, often under fire—an immense advance since Chancellorsville, where half the army was beaten without firing a shot."

We have no hesitation in saying that this book of M. Grasset's exhibits a remarkable acquaintance with the persons and events of our war. Occasionally he is on a false scent, as where he is inclined to suspect that to Sherman belongs the credit of the brilliant manœuvres near Chattanooga in November, 1863, which he says "ressemblent peu aux procédés ordinaires de Grant." The credit here, as is well known, belongs to Gen. W. F. (Baldy) Smith, then Chief Engineer of the Army of the Cumberland. But the book, as a whole, gives one a very correct notion of the men who were prominent in the war on both sides, both as respects personal character and military and political capacity.

* In this, M. Grasset is mistaken; the policy of invading the North met with the entire approval of Gen. Lee.

The Court and Reign of Francis the First, King of France. By Julia Pardoe, author of 'Louis XIV.,' etc. 3 vols. Scribner & Welford. 1887. 8vo.

Miss Pardoe's historical works are too well known to require commendation, as graphic and truthful representations of the periods which they describe. The fruit of conscientious and painstaking industry, as well as of a narrative power of high excellence, they well merit the sumptuous new edition in which her 'Francis the First' has been presented to us. The periods chosen by Miss Pardoe as subjects of her skilful delineation—the reigns of Louis XIV. and of Francis I.—although separated by a century, have something in common, in the splendor and brilliancy of the court, as well as its extreme corruption. They may be well contrasted with the stormy times of the Huguenot wars and the strong rule of Richelieu, which lie between them. The two kings, the most brilliant in their line except Henry IV., resemble one another in a real kingliness of temper and demeanor, and a genuine love for art and literature, joined with utter selfishness and profound sensuality. From the point of view of elegance and gayety, these are no doubt the most attractive periods in French history—qualities which make them peculiarly suited to a writer of Miss Pardoe's special powers, and explain her selection of times which were morally so detestable.

The work before us can hardly be said to suffer from the want of a revision which should bring its scholarship to the level of present information. The period of nearly forty years that has passed since it was written has added much to our knowledge of the period, and, if the author could now make a fresh study of the authorities, she would no doubt change her judgment on many points. One does not, however, read Miss Pardoe for historical information, but rather to quicken the historical imagination, and inform the dry details of history with life. This power in a writer is certainly second to that of critical judgment and accurate scholarship, but is valuable in itself, and too apt to be overlooked in our days of minute historical investigation. Still, if we can hardly ask for a thorough revision of a work the excellence of which is essentially literary, an occasional correction or note would nevertheless be helpful, as, for instance, on page 51 of the first volume, where it is hard to recognize the despot of Perugia under the term "hereditary sovereign of Pérousa"—a name neither Italian, French, nor English. The book is printed in elegant style, and adorned with eighteen well-engraved portraits. The cover of each volume is stamped with a pattern designed by Diana of Poitiers.

California of the South. Its Physical Geography, Climate, Resources, Routes of Travel, and Health-Resorts. Being a complete Guide-Book to Southern California. By Walter Lindley, M.D., and J. P. Widney, A.M., M.D. With maps and illustrations. D. Appleton & Co. 1888.

It is pleasant to find a book so satisfactory to the searcher after truth regarding California as this is. The careful manner in which the whole is written impresses the reader with the sincerity of the compilers, and their evident desire to be impartial gives weight to some surprising statements. Part first, on Climatology, is of great interest to the inhabitants of Southern California, as well as to visitors and intending settlers, and cannot be too highly commended. It is a matter of regret that a map calculated to mislead the casual observer should find a prominent place. The term "mean temperature" means only confusion to the average reader. He can form no correct idea of the real conditions of heat and cold from the two portions of the map that are colored alike to indicate that those localities have the same temperature. One embraces the coast line from Mexico to Santa Barbara, and has the most equable and agreeable climate in Southern California. The other includes the San Joaquin and Sacramento valleys between the Coast Range and the Sierras, portions of which are well known to be very hot and malarious in summer, and subject to sharp frosts in winter. The same map has been published separately in Los Angeles, and widely distributed, but is generally condemned. The statement as to the general character of the Chinese inhabitants of Los Angeles will be denied by many whose experience has been widely different, and who have been faithfully served for years by Chinese servants. Compared with the average servant of any nationality, the testimony is greatly in their favor as to honesty, respectfulness, and personal cleanliness, though it is difficult to reconcile their known habits in the latter respect with their custom of herding together in airless dens when in pursuit of amusement or society.

The appendix concerns those who are thinking of finding a home in Southern California, yet desire a reasonable assurance of ways to make a living. The authors are apparently

well informed on the subjects of which they treat, and moderate in most of their statements, but it would be well if he who writes in part iii, of the olive, that "ten acres of olives, four years from the planting of the cuttings, will support a family," should mention at least one instance of such a remarkably fruitful orchard, even though the family comprises but two persons. He should also have stated that the present high price of oil cannot be sustained when the best methods of treatment are widely understood. At present only a few growers are successful in its manufacture, and the supply, therefore, is very limited.

It would also be well for the reader to remember that the dazzling sunshine of California affects the eyes of the most sincere writers, making it, apparently, physically impossible for them to see the inevitable shadows. Guides who tell only of the pleasant paths and fine views, and give no warning of the rough places and possible pitfalls, are not the best kind for a traveller in a strange country. Let him know of the chances against him as well as for him, so that, having prepared himself to meet obstacles and some buffets of fortune, he will not be unduly discouraged, nor complain of his guide.

Our Sentimental Journey through France and Italy. By Joseph and Elizabeth Robins Pennell. Longmans, Green & Co. 1888.

THIS is an artist's journey from Calais to Lyons and a little beyond, in which the pleasant feature is the large number of small illustrations of French types and landscape which are profusely scattered over the pages. It makes a very pretty volume, and is even an advance in this respect over the other two attractive books of tricycle travel which the same authors have published. It is, however, a tricycle journey: the roads and the inns are the most engrossing subjects of interest; the wind, the rain, and the good weather are next in importance, and the face of the country and the manners of the inhabitants come last. Accidents, of course, providentially occurred, and these fill the place of adventures. There was some sentiment included in the plan, and the travellers did follow upon the track of Sterne, to whom they dedicate their ramble. But sentiment was in practice hard to come at; they discovered the second day that it did not depend upon their own volition. The country was as fair as ever, and the sketches show its quiet fields and rolling hills and still, poplar-shadowed rivers. There must have been charm in it, and once there was enthusiasm over one day's ride; but the travellers do not seem to have had a really good time. Perhaps the text is too closely confined to the notes taken at the time. We are certainly told very little about the things seen. Millet's country was on the route, and there is a pleasant chapter on a small scale about it. Stevenson was a fellow-traveller to be remembered with Sterne, and Ruskin was remembered at Amiens. There is a good word for the French commercial traveller, who, according to other tourists, sadly needs it. But the volume altogether is to be regarded as an artists' sketch-book of the roadside, and it is a very agreeable collection of such glimpses of old gates, streams, peasants, landladies, and soldiers on horseback at the autumn manœuvres.

Outlines of Society, Literature, and Politics. By Edwin Percy Whipple. Boston: Ticknor & Co. 1888.

THIS new volume of Mr. Whipple's Collected Writings is made up in the main of political articles written upon the topics of the war time or of the period of reconstruction. They have a good deal of the heat of party in them, as well as patriotic fire, and they are so specific in their treatment that they can have now only an historical interest as illustrations of the pamphlet-warfare of the time. Such questions as are raised in them require more close connection with general principles if the paper is to take any place in literature; but they are not characterized by the broad grasp and philosophic habit of mind which sometimes make contemporary pamphlets, written for special purposes, always of use to the political student. Nearly everything in them is now dead matter. The other essays are upon the decadence of morals in the business world, the increase of luxury, and like subjects, or upon literature. Of this last division, however, there is only a very small proportion—one little essay upon Mr. Lowell's prose style, and another rambling paper entitled "Dickens-land," which some of our readers may remember. The whole is not an unfair illustration of Mr. Whipple's literary work when he had no intention of making a book. They are the papers of the magazine-writer, not meant to live beyond the hour or to serve any but a passing purpose, and in no sense are they to be regarded as a part of the work upon which his reputation as a writer is based. The volume is well printed and altogether a handsome one; yet it only cumbers the shelf which is already sufficiently well laden with its author's literary criticism.

A Quarter of a Century in Photography. A collection of hints on practical photography which form a complete text-book of the art. By Edward L. Wilson. New York: The Author, 835 Broadway.

MR. WILSON'S name is known as far as the literature of photography has spread, and, so far as that literature is concerned, his labor is inseparable from all that has been done since it assumed the importance it now has. The fault we must find with this book, which is the result, in the last reduction, of all his studies, is that he has "pitchforked" all he has ever known over to the public, and made a manual so huge, and containing so much material that is only to be learned to be forgotten, that it is practically of no use to the beginner, while the old hand knows it all already. The knowledge of the wet-collodion process, in all its vexatious and uncertain details, is to the modern photographer perfectly superfluous, and the time spent in learning it, if anybody were so uselessly disposed, would enable the tyro to do all that he needs to do by the gelatine processes.

When we have manuals of fifty pages which teach all that an intelligent person need be taught by a book, or indeed can be so taught of photography, it requires a ponderous patience to go through a volume of above 500 pages. To shorten it, the utterly irrelevant quotations from Ruskin and other art writers might have been left out, as worse than useless because misleading. It is well indexed, and for that reason it deserves a good word and a place as a book of reference for students of the history of photography. For those who care only for the practical results, time may be more usefully employed than in the reading of Mr. Wilson's "hints."

BOOKS OF THE WEEK.

Ashton, J. The Fleet: its River, Prison, and Marriages. Scribner & Welford.
Bardeen, C. W. Common School Law. New ed. Syracuse, N. Y; C. W. Bardeen.
Beecher, Rev. H. C. Milton's Paradise Lost. Book I. Oxford: Clarendon Press; New York: Macmillan & Co. 40 cents.
Blades, W. The Enemies of Books. Revised ed. A. C. Armstrong & Son. $1.25.
Brown, Marie A. The Icelandic Discoverers of America. Boston: The Author.
Cable, G. W. Bonaventure: a Prose Pastoral of Acadian Louisiana. Chas. Scribner's Sons. $1.25.
Cary, Rev. H. F. Dante's Inferno. Scribner & Welford.
Chamber's Encyclopædia. Vol. I. A to Beaufort. Philadelphia: J. B. Lippincott Co. $3.
Coles, Dr. A. New Rendering of the Hebrew Psalms into English Verse. D. Appleton & Co.
Evelyn, John. The Life of Mrs. Godolphin. A. D. F. Randolph & Co. $2.50.
Featherman, A. Social History of the Races of Mankind. Oceano-Melanesians. London: Trübner & Co.
Fitzgerald, P. Life and Times of John Wilkes, M. P. 2 vols. Scribner & Welford.
Goethe's Boyhood. 1749–1764. Translated by John Oxenford. Scribner & Welford.
Goethe's Faust. Translated by Anna Swanwick. Scribner & Welford.
Goldsmith, O. Vicar of Wakefield. Boston: Ginn & Co. 40 cents.
Harrison, W. H., jr. How to Get Rich in the South. Chicago: W. H. Harrison, jr., Pub. Co.
Henry Irving Shakspere. Vol. II. Scribner & Welford.
Inge, W. R. Society in Rome under the Cæsars. Chas. Scribner's Sons. $1.25.
Lawrence, W. Life of Amos A. Lawrence. Boston: Houghton, Mifflin & Co. $1.25.
Lemaitre, J. Impressions de Théâtre. First series. Paris: Lecène & Oudin; New York: Christern.
Lessing's Laokoon. Translated by E. C. Beasley. Revised ed. Scribner & Welford.
Lord Bacon's Essays. Scribner & Welford.
Lowell, J. R. Heartsease and Rue: Poems. Houghton, Mifflin & Co. $1.25.
Macgregor, J. G. Elementary Treatise on Kinematics and Dynamics. Macmillan & Co. $2.60.
Markham, C. R. The Fighting Veres. Boston: Houghton, Mifflin & Co. $4.
Martin, E. S. A Little Brother of the Rich, and Other Poems. Mitchell & Miller. $1.
Molee, E. Plea for an American Language, or Germanic-English. Bristol, Dakota: The Author. $1.
Oliphant, Mrs. The Makers of Venice. Macmillan & Co. $3.
Pierson, A. T. The Inspired Word: Bible-Inspiraton Conference, Philadelphia, 1887. A. D. F. Randolph & Co. $1.50.
Pole, W. Theory of the Modern Scientific Game of Whist. G. W. Dillingham. 25 cents.
Renan, E. The Abbess of Jouarre. G. W. Dillingham.
Richardson, C. Large Fortunes; or, Christianity and the Labor Problem. Philadelphia: J. B. Lippincott Co. 75 cents.
Riley, Prof. T. M. Chas. George Gordon. Milwaukee: The Young Churchman Co. 65 cents.
Salis, Mrs. de. Savouries à la Mode. G. W. Dillingham. 15 cents.
Saltus, E. The Truth about Tristrem Varick. Belford, Clarke & Co. 50 cents.
Sawyer, Dr. H. C. Nerve Waste. San Francisco: The Bancroft Co. 75 cents.
Schiller's Dramas. Mary Stuart, translated by J. Mellish. The Maid of Orleans, translated by Anna Swanwick. Scribner & Welford.
Schrakamp, Josepha. Erzählungen aus der Deutschen Geschichte. Henry Holt & Co.
Seidl, R. Industrial Instruction: A Pedagogic and Social Necessity. Boston: D. C. Heath & Co. 80 cents.
Sidney, Margaret. St. George and the Dragon: a Story of Boy Life. Boston: D. Lothrop Co. $1.
Sinclair, Ellery. Victor: A Tale. Cassell & Co. $1.
Smith, C. Treatise on Algebra. Macmillan & Co. $1.90.
Smith, May Riley. The Inn of Rest: Later Poems. A. D. F. Randolph & Co. $1.
Spiers, R. P. Architectural Drawing. Cassell & Co. $5.00.
Stanley, Capt. Z. L. The Mysterious Doctor: A Novel. G. W. Dillingham.
Statesman's Year-book for 1888. Macmillan & Co. $3.
Stebbins, G. B. The American Protectionist's Manual. New ed. Chicago: Chas. H. Kerr & Co. 75 cents.
Stevenson, R. L. Treasure Island. New ed. Boston: Roberts Bros. $1.25.
Stewart—Gee. Practical Physics for Schools. Vol. I. Electricity and Magnetism. Macmillan & Co. 60 cents.
Stockton, F. R. The Dusantes. The Century Co. 50 cents.
The Story of Colette. D. Appleton & Co. 25 cents.
Yeld, Rev. C. Florian's Fables. Macmillan & Co. 40 cents.

HENRY HOLT & CO., Publishers, New York.

THE MOTHER'S REGISTER.

In any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Prof. J. B. Fonssagrives's 'Mother Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1.25 for two volumes. Address Publisher of the Nation.

DAVID G. FRANCIS,

17 ASTOR PLACE, NEW YORK.

DEALER IN VALUABLE OLD AND NEW

BOOKS.

Priced Catalogues issued from time to time, sent gratis to any address.

The Week.

THE long-delayed decision in the telephone cases has finally been announced, and it is a complete victory for the inventor. As an appropriate sequel to the defeat in the courts at Boston, last fall, of the attempt to impair the value of the Bell patents by a suit in the name of the Government, comes now the decision of the Supreme Court of the United States at Washington sustaining their validity over the separate and combined efforts of interested parties to break them down by a mass of falsehood, misstatements, and elaborate arguments the like of which has seldom if ever been produced on any one subject in litigation in this country. On the most important issue, so far as the law of patents is concerned, the court is unanimous. The holding is clear that a line may be drawn between discovery and invention. A man discovers an art or an improvement in the art, and invents the apparatus or means of utilizing his discovery; and when he so brings his discovery to a state of practical utility through the medium of a working device, he is entitled as fully to all the benefits of his discovery as he is to the invention, and is not limited to the mere apparatus devised. This has been the great question in the telephone cases, the important point of law that has been submitted for the decision of the court of last resort. On this question the court is unanimous in conceding the right, under the Bell patent, to control the use of the undulatory current. It is only on questions of fact in relation to the alleged inventions of Drawbaugh that the court is divided; and when the immense mass of testimony given by this man and the scores of witnesses brought forward to corroborate him are taken into consideration, it is not to be wondered at that some of the judges were overpowered by the weight of evidence. The insinuations of fraud on which was based the Government suit, which has thus far been a failure, are considered, and swept away with the remark that "not a shadow of suspicion can rest on any one." This will leave the pending suit of the Government now before this same court in a sorry plight, and foretells its ending in disaster to all connected with it.

Could there be a more ridiculous and humiliating spectacle than the following, as described by the *Chicago Tribune*?

"The Post-office authorities are said to be apprehensive of troubles on the Santa Fé system. The mail service on the Burlington since the strike began, it is said, has not been as good as it might have been. Now, if the Santa Fé were tied up, and the Union Pacific also, there would likely arise a serious state of things in connection with the transportation of mails to the Pacific Coast. General-Superintendent Nash of the Railway Mail Service came from Washington Saturday night, and was in consultation all that evening with the Chief. Again, yesterday afternoon Capt. James White, Superintendent of the Western Division of the Railway Mail Service, called upon Mr. Arthur. The result of these conferences has been the promise by the Chief that, whatever may happen, the mails will not suffer delay or inconvenience. If necessary, Brotherhood men will pull the engines. Mr. Arthur assured both Mr. Nash and Capt. White that they need not feel any uneasiness whatever."

Here we have the officers of a nation of 60,000,000 actually negotiating timidly with the head of a band of 25,000 conspirators for permission to carry the United States mails over the public highways! "The Chief," we are gravely told, assured the Government of the United States that it "need not feel any uneasiness whatever."

Mr. Arthur has lately said in an interview in Chicago that for fourteen years no Brotherhood engineer had deserted his locomotive. We are sorry to say that, as we showed week before last, this is not true. Brothers struck and deserted their engines on the Central of New Jersey, wherever they happened to be, at midnight on October 23-4, 1876, forcing the road, which was then much embarrassed financially, to comply with their demands. November 16 of the same year the Brothers also struck on the Cairo and St. Louis, deserted and disabled their engines, and assaulted the men who attempted to take their places, cut the telegraph wires, and took forcible possession of the depot, yards, and machine shops at East St. Louis. On the 15th of November, same year, the Brothers on the Georgia Railroad struck and abandoned their engines, wherever they happened to be, at one A. M. On the 29th of December, same year, the Brothers struck and abandoned their engines on the Grand Trunk at seven P. M., wherever they happened to be, in the midst of a heavy snow-storm, leaving trains filled with passengers standing on the single track which was all the line had. On the next day they assaulted and drove off the men who came to take their places, ran the engines off the track, and laid snow-ploughs across it. In these conditions the company had, after three days' struggle, to give way, and Arthur compelled it to repay him his expenses for coming to Montreal to organize and direct this dastardly outrage. This was, however, his last success. His next attempt was made on the Boston and Maine, but that corporation throttled him, and he then laid in a stock of wisdom which has apparently lasted him until now. He has now, however, a bigger job on hand than he has ever before attempted. His previous operations have been confined to one road at a time on which the employees had a difference of some sort with the corporation. What he has lately been aiming at is a general stoppage of the highways of the United States, in order to help him in carrying his point in any one dispute anywhere.

Gov. Larrabee of Iowa on the 10th inst. wrote a letter to the president of the Chicago, Burlington and Quincy, which, in its way, was worthy of our own Hill. Its sole purpose, evidently, was to aid the strikers in taking possession of the road. He calls attention to "the inconvenience and disappointment caused by the present state of affairs" to "the travelling public and to commerce," and therefore appeals to him "to come to an understanding with the strikers," threatens him with suits for damages for failure to "furnish reasonable facilities for the transaction of business on the road," and suggests that "the controversy be submitted to arbitration." We need hardly say there is now no controversy whatever, and nothing to submit to arbitration. The strikers left the service of the company because they did not like it, which they had a perfect right to do. Other men who do not object to it have taken their places. The exact state of the case on Monday week was this: The company had in its service when the strike began 1,053 engineers, but they were never all fully employed. The road could not use now over 800, and on Monday week it had 684 at work, 30 had just applied, and 100 more were on their way. Now, these men are the only engineers with whom the C., B. and Q. Road to-day has any relations. They are as good men in the eyes of God and man, and ought to be as good in the eyes of politicians, as the strikers, and they are much better entitled to the name of "Labor," because they are willing to work, and are working. They do not ask for arbitration or "settlement" of any kind, except the payment of their weekly wages. Somehow or other, this species of labor gets neither sympathy nor attention from the Hills and Larrabees.

The elaborate canvass which has been made by the Philadelphia *Times*, showing the Republican Presidential preferences in New York, Pennsylvania, Ohio, Indiana, and Minnesota, is not especially encouraging for the party. It shows, summed up briefly, that the real first choice of the majority of the party is Blaine, and that if he had not written his Florence message, he would have been renominated by acclamation. Even after that message, the canvass shows that out of 7,000 replies which were received, fully one-third are in favor of nominating "Blaine anyway." Next to Blaine stands Sherman, but there is a perceptible lack of warmth in the support professed for him. Even in Ohio it is evident that Gov. Foraker is more suited to the party taste. Chauncey Depew has considerable strength in the Eastern States, but very little elsewhere. In Indiana, Harrison is much stronger than Gresham, and in Pennsylvania Lincoln is ahead, though the party there is obviously yearning for one more trial of Blaine. In fact, the real outcome of the canvass is, that at least one-third of the party is determined upon the great policy of "*aut Blaine aut nullus.*" This third may be called the "knifers," for,

should any other candidate than Blaine be nominated, they would see to it that he was never elected. There really seems to be no escape for the party. It must march peacefully and unresistingly to its fate and submit to Blaine's renomination. Nothing but the overwhelming defeat which will inevitably follow can cure it of its trouble, and it is almost certain the patient will die under the operation.

The Bulletin of the American Iron and Steel Association intimates pretty plainly that if Judge Gresham is nominated for the Presidency by the Republicans, the protected classes will bolt the ticket. It assumes that Judge Gresham's views on the tariff are unsound because the Chicago *Tribune* supports him so earnestly. "If the choice for the Presidency next fall," it says, "is to be between Mr. Cleveland and a half-hearted, milk-and-water 'revenue reform' Republican, who is acceptable to the free-trade element in the Republican party, Mr. Cleveland will be elected. If the Republican party is to be restored to power next fall, it must be upon an out-and-out platform of *protection for the sake of protection*, with candidates for the Presidency and Vice-Presidency whose records are in accord with that declaration." This declaration is tolerably plain and extremely brazen. The old-fashioned doctrine of "a tariff for revenue, with incidental protection," is completely discarded, and the fiat is laid down that a tariff for the sake of protection regardless of revenue is the only doctrine that will secure the support of the Steel Trust for the Republican nominees—and that if anybody is nominated whose views on this subject are doubtful, they would prefer the reëlection of Cleveland. We presume that the Republican party will take notice, and as for Judge Gresham, we are convinced that nobody will ever get a word out of him before the Convention is held to propitiate one side or the other. Practically, therefore, he seems to be ruled out by the Trusts.

Senator Plumb of Kansas on Monday made some remarks on the International Copyright Bill which seemed to indicate that he looked on the absence of international copyright as a measure of "protection" for native authors, or for somebody, we do not exactly know whom, and suspected the friends of the measure of being free-traders in disguise. We believe a notion of this sort is not uncommon outside Congress as well as in it. A very little reflection will show, however, that the protection for American authors, as the term is generally understood, would consist in an import duty on the works of foreign authors, which would exclude them wholly from the country, or else make them very dear in our market. Our present system is as far as possible from protection for anybody. It can only be compared to a system under which we should permit cargoes of foreign goods to be seized and pillaged by the first persons who could reach the ship, and then "slaughtered" or sold at very low prices in the market for the sole benefit of the robbers. There is not the shadow of a resemblance between this and the protective system as practised in any civilized country.

Mr. Randall's Tariff Bill has one salient feature, and only one, that marks and distinguishes it from other projects for reducing the surplus, viz.: the reduction of the whiskey tax to fifty cents per gallon, and the preservation or conservation of the duties on sugar. All the information obtainable from Republican circles shows that the party which charges itself with the duty of "protecting American industry" is in favor of making a larger reduction on sugar than is made by the Mills bill, and is not in favor of reducing the liquor taxes at all. The only Republican of note who has declared his adhesion to the Randall bill is Judge Kelley of Pennsylvania, who, in fact, declared himself in favor of the entire repeal of the liquor tax more than a year ago. Kelley and Randall have for many years been the Siamese twins of tariff extortion. It is a great pity that they should belong to different parties. Perhaps they will not long be in this anomalous attitude. Randall's bill has been put forword as an obstacle to the Mills bill. Nobody supposes that the Randall bill can pass. Whether it has vitality sufficient to stop the way for the Mills bill, remains to be seen. Aside from the paralyzing influence of the Treasury surplus, it makes little difference whether the Mills bill passes or whether any bill passes. Taking a wide view of the situation, political and industrial, the main thing is to get the tariff issue before the people so that the country may be educated and brought to an intelligent conclusion upon it. There is good reason to believe that this end will be reached, whether the starting point be the Mills bill, or the Randall bill, or some third measure to be formulated by the Republicans. The horrible surplus, however, requires some action. It will not stop growing and will not be postponed. If the Mills bill is defeated, there will be a struggle over whiskey and sugar as sources of revenue. And in this conflict we shall expect the sugar tax to fall rather than the whiskey tax, notwithstanding the gallant fight in the Union League Club in favor of distilled spirits.

The Washington *Capital*, an independent newspaper, hopes that Senator Hale and his Civil-Service Investigating Committee will make a thorough examination in regard to the present state of the classified service. The *Capital* says the main facts in the case are these: "There were about six thousand five hundred clerks in the departments within the provisions of the Civil-Service Law when it was passed. Every one of them was subject to removal without a violation of its letter. Not a tenth of them have been removed during the three years of Mr. Cleveland's Administration. With vacancies occurring by natural causes, all of which have been filled by operation of Civil Service rules, there remain now in office not less than 5,000 Republican clerks, appointed under Republican rule, and many of them by the operation of vile political methods."

Senator Stewart of Nevada made a speech a fortnight ago to show up the wickedness of the demonetization of silver in 1873. The speech seemed to be rather late coming, but perhaps this was the first chance Mr. Stewart had had to relieve his mind. We must protest, however, against the injustice done by him to the memory of the late Ernest Seyd, who was one of the most indefatigable champions of silver in the civilized world. Mr. Stewart would have us understand that Mr. Seyd came to this country to whisper into the ear of Comptroller Knox that circumstances were favorable for "striking down silver" by a dastardly and secret blow, and that Mr. Knox took the hint and framed the bill of 1873 accordingly, which dropped the silver dollar from the list of American coins. The wicked Seyd then went home, and, in order to cover up his tracks, began to write books denouncing the demonetization of silver, and urging the Governments of Europe and America to retrace their steps, and kept up this hypocritical game till the day of his death. At least we suppose so, although Mr. Stewart drops Mr. Seyd altogether from the moment he gets him closeted with Mr. Knox.

The recent municipal election in Mobile, Ala., was rendered noteworthy by the breaking down of the color line for the first time in the history of the city and, indeed, on any large scale in the State. Hitherto the whites have voted one ticket and the blacks another, in local as well as national contests; and so long as the Republicans were in power at Washington, no change seemed possible. But the negroes in Mobile have at last discovered that black men have nothing to gain, but rather everything to lose, by voting in a solid mass. As the *Christian Register*, a Mobile paper published by colored men, says: "We have learned that there is nothing in a name, and our action on last Monday is a proclamation to the world that the negro is no longer a tool in the hands of ambitious men; neither is his vote a cat's-paw for the use of political monkeys."

That ancient terror of the bar, the Field Code, has come up again in the Legislature. It accordingly behooves all those who regard it as a Pandora's box of evils, without the redeeming element of hope, to lay aside their excuses and business, and give their time and energies once more to the task of beating it off. This is an annually recurring duty, because there will always be a certain proportion of lawyer cranks in the Legislature, and a certain number of unthinking persons who fancy that, with a plainly written code, every man can be his own lawyer. The latter are the more dangerous, because they are the more numerous class in the community, if not in

the Legislature. They are quite unmindful of the fact that when the code passes, if it ever does pass, the interpretation of it will become the great question of the day in all the courts, and will multiply and protract litigation, rendering the services of the legal profession more necessary than ever, and making it more difficult than before for any man to be his own lawyer. Mr. George H. Adams, a member of the bar of New York, has rendered a public service by showing, in an eight-page pamphlet, how the Field Code stands in reference to the new-fangled Trusts that the Legislature and Congress are just now trying to grapple with. What these Trusts want most of all is an assured legal status. Mr. Adams shows that the Field Code supplies this precise deficiency, and if passed by the Legislature puts them on a sure footing.

It is probably true that the law now authorizes individuals to enter into these Trusts, but it does not authorize corporations to do so. It certainly does not *expressly* authorize them to do so. "Assuming," says Mr. Adams, "that the objects of the Trust are not in themselves open to criticism, it is very doubtful whether the law now sanctions an agreement whereby a stockholder or the majority of the stockholders divest themselves irrevocably of the power of voting on their stock by vesting in perpetuity in another, not a stockholder, or not the holder of that stock, the absolute power of voting thereon. But there is no doubt that the courts have repeatedly declared unlawful any action by a corporation as such, the result of which is to divest itself of, and abrogate, its powers as a corporation, and to clothe another with that franchise, or its use, which the State granted to the corporation." The Field Code supplies the preëxisting want of authority to corporations to amalgamate themselves in Trusts by first defining Trusts, and afterwards declaring that words used in the singular number include the plural, and that the word person "includes not only human beings, but bodies politic and corporate," so that whatever a person can do hereunder a corporation can do.

There is going to be a fresh attempt made to force Keely to reveal the secret of his motor, but we are not sanguine of its success. This is not the first time that judicial pressure has been brought to bear upon Keely. He has been forced several times to give up his secret, but he has given it up in language which the human mind, as at present constituted, has been totally unable to understand. Curiously enough, the persons to whom he communicated it, though so dazed at first that articulate speech was impossible for several weeks, finally found voice in explanations which, like Keely's own, were very impressive, but entirely incomprehensible. We are of the opinion, therefore, that the present attempt will not succeed. A commission has been given an order to "inspect the motor" and report, and the order, we believe, gives them power to catechise Keely himself. It has always been easy to do these things, but it has always been impossible to understand either the motor or Keely. That shows what a great secret it is. There is apparently no hope of ever understanding it till we can understand Keely.

Dr. Patton, the new President of Princeton, made on Thursday a witty and lively speech at the Princeton dinner in New York, outlining his policy as the head of the College, but outlining it so vaguely that we doubt if anybody was much the wiser for it—which is a pity, as Dr. Patton's fame is rather controversial than collegiate. He intimated that the College would be under his charge "American," but in what sense American he did not explain, further than that it would not be French, or Scotch, or German. He said, also, it would be "Christian," but how Christian he did not explain, beyond saying that a young man would "not have philosophy taught him that would undermine his faith in God;" but the only explanation he gave of this was that the young man "shall see the universe opened, and deal with the facts and problems of life under theistic conceptions." The young man who will have this done for him at college will be a very lucky fellow, but what system of philosophy does it, and how can the universe be "opened" to a young man without giving him glimpses of systems of philosophy of which the College disapproves or does not teach? The universe is a great miscellany, and Princeton must be a wonderful university if it keeps its young men from seeing or hearing any but the good things. Dr. Patton said, too, "We may as well get rid now of the idea that a university means simply a place for special research, or an aggregation of colleges, or a coördination of faculties, or a series of professional schools." He did not say, however, what a university is if not this. When we have got rid of this idea, what have we left? We trust he will, before long, on some more formal occasion, clear up these dark places. Nothing is more important to a university than the President's definition of it.

The loss of a character so gallant, so public-spirited, so sincere and self-sacrificing, and withal so modest as that of the late Henry Bergh, in a community like this, where those who have no votes find it so hard to get a hearing or consideration, and where "No. 1" is so carefully looked after, is simply incalculable. If "our colleague, the horse," as Prof. Huxley has so happily called him, could pick out his benefactors, and could go where he pleased, few men would be followed to the grave by so many sorrowing friends as Henry Bergh. For he was the best friend dumb animals have ever had in this community, the first to devote his life to their protection from cruelty and greed, to make their lot in this brief passage of theirs across the earth less hard, and to set a noble example of literally thankless service.

A correspondent writes to us from Washington expressing pleasure in the account we gave the other day of the adventure of the Duponts and Durands in Paris, and maintaining that we have them here "in our midst." He tells us a story of a Washington Durand who used to shower invitations on the whole town, and sent one to a secretary of legation to whom he was entirely unknown. The secretary asked his chief whether under the circumstances he ought to accept it. The chief's answer was, "Certainly. In this country there are only two social distinctions —the rich and the poor. Durand is presumably rich, or he would not be giving a party, and he is therefore 'in society.'"

The Local Government Bill, introduced in the House of Commons on Monday, is the most important measure of English legislation since the last extension of the suffrage. It is difficult to say as yet whether its democratic character constitutes a Tory or Liberal victory. The Liberals have been very confident that the Tory party would split in any attempt to give the counties real popular government and oust the landed gentry from their last political stronghold. It was supposed they would not be able to produce a bill on which they would agree, and for which the Liberals could vote. It has still to be seen whether the Ministry can keep its forces together during the passage of the bill. If it can, it will undoubtedly "dish the Radicals," much as Lord Derby and Disraeli "dished the Whigs" in 1867, by passing Gladstone's extension of the franchise. That the counties will get as good a government as they have now, from representative assemblies, in the matter of purity and economy, many will doubt until they see it. The Boss will make his appearance before long, attended by his Boys, and if they succeed in introducing "rotation in office," and in distributing "spoils" among the "victors," the rule of the justices of the peace will be looked back to as the golden age of rural England.

One of the most significant passages in the letter of the Emperor Frederick to Prince Bismarck is that in which he says: "I desire that the bases of religious toleration which for centuries past were held sacred by my house shall continue to be extended to all my subjects of whatever religious community or creed. Every one of them stands equally near my heart, for all have shown equally complete devotion in times of danger." It would hardly have been possible to express, on such an occasion, stronger condemnation of the anti-Semitic agitation by which Prussia has during the past few years been somewhat disgraced. The Emperor has since emphasized these views by bestowing the order of the Black Eagle on Dr. Friedberg, the Minister of Justice, who is, if not a professed Jew, a Jew by birth.

A MASSACHUSETTS BALLOT ACT.

MESSRS. Richard H. Dana and Morrill Wyman, jr., have prepared for the Committee on Election Laws of the Massachusetts Legislature a ballot bill which is, in many respects, the best measure of the kind that we have yet seen. It is a more perfect application of the best principles of the English and Australian laws than has been made in any other of the many bills which have been prepared in various States for legislative consideration. The authors of the bill have given careful consideration to all the most worthy of the pending bills, and have adopted whatever has seemed to them most commendable in any or all of them. They have drawn most freely from the bill prepared by a committee of the Commonwealth Club in this city, now at Albany, taking its title for theirs, copying many of its sections almost literally, and adopting the ideas in others. At the same time, they have gone beyond any measure prepared here or in other States, in the extent to which they have applied the principles of the foreign election acts.

Their bill opens with a provision that all ballots shall be printed and distributed at public expense. Upon that point there is no longer any division of opinion, everybody conceding the wisdom of taking from the political organizations the dangerous and corrupting control of the ballots which has been so long in their hands. In regard to nominations, the bill follows closely the provisions of the Commonwealth Club bill, adopting its phraseology in reference to individual or independent nominations by stating that a nomination paper or certificate may consist of "a writing or writings," thus allowing petitions for nominations to be signed in duplicate. The number of signatures required "shall not be less than 400 for any office to be filled by the voters of the State at large, and for any other office not less than one for every 100 voters who voted at the last election in such political division or district, provided the number is not less than 10 or greater than 100."

In reference to the printing of the ballots, the Massachusetts bill differs materially from all others yet proposed in this country. It provides that each ballot "shall contain the name, residence [with street and number in city elections], and party or political appellation of every candidate whose nomination for any office to be specified in the ballot has been duly made," the names to be arranged in alphabetical order, except that Presidential electors are to be arranged in a separate group. Blank space is to be left at the end of each list of candidates large enough to contain as many written names and residences as there are offices to be filled. The novel part of these provisions is the requirement of the residence, street, and number of each candidate. This is exacted by the English law, together with the designation of the candidate's occupation. While they are about it, the Massachusetts reformers would do well to require the occupation to be included. Taken altogether, name, residence, occupation, and politics, the ballots would be in all city elections an invaluable guide to voters. In the country, where every man knows his neighbor's business, such information is unnecessary.

The Massachusetts bill has also a novel and it seems to us valuable provision in regard to the official marking of the ballots. It requires that before distribution the ballots shall be folded, and on the back and outside when folded, shall be printed, "Official Ballot for," followed by the designation of the polling place for which the ballot is prepared, and the date of the election, with a facsimile of the signature of the Secretary of the Commonwealth, or City Clerk, who has caused the ballot to be printed. There shall also be printed on tinted paper, without the facsimile signature, ten or more copies of the ballots for each polling place, which shall be called specimen ballots. Full instructions for voting shall also be printed on cards in large, clear type to be posted in the polling places. The provision for distributing the ballots to the election officers at the polls is so specific, and so interesting as an effective means for preventing forgery of the official ballots, that we give it in full:

"Section 14. The Secretary of the Commonwealth shall send the proper ballots, specimen ballots, and cards of instruction printed by him, as above provided, to the several city and town clerks, so as to be received, one set at least forty-eight hours before the day of election, the other set sent separately so as to be received at least twenty-four hours before the day of election. These ballots, specimen ballots, and cards shall be sent in separate sealed packages clearly marked on the outside for the polling place for which they are intended, and the number of ballots enclosed. The ballots, specimen ballots, and cards of instruction printed by the city clerks shall each set be packed in separate sealed packages clearly marked on the outside for the polling precincts for which they are intended. The city and town clerks shall send to the several officers of each precinct or to the selectmen of the town before the opening of the polls on election day, in the manner in which the ballot-boxes are required to be sent, one full set of the packages of ballots, specimen ballots and cards intended for that polling place, keeping a record of the number of ballots sent to each polling place. The second set shall be retained until they are needed for the purposes of voting. At the opening of the polls in each polling place, the seals of the packages shall be publicly broken and the packages opened and the books of ballots handed to the ballot officers, hereinafter provided for, by the precinct officer or the selectmen of the town, presiding at such polling place. The cards of instruction shall be posted in each place provided for the marking of the ballots, hereinafter provided for, and not less than three such cards, and also not less than five specimen ballots, posted in and about the polling place outside the guard rails, before any ballot is delivered to any voter."

When the voter receives his ballot, after he has shown that he is entitled to vote, he must go alone into a compartment and check with a cross in the margin of the ballot the names of the candidates for whom he wishes to vote. Then he must fold his ballot so that the official endorsement on the back will be visible, and, coming from the compartment, deposit it in the ballot-box. No ballot without the official endorsement can be received by the officers in charge of the ballot-boxes, and if any such should get in, it must be thrown out in the counting. Any voter who allows his ballot to be seen by any person with the apparent intention of letting it be known how he has voted or intends to vote, or any person who interferes or attempts to interfere with any voter while marking his ballot, or who attempts to ascertain in any way how he has voted, shall be punished by a fine of not less than $5 or more than $100.

These are the provisions of the act which are most interesting because of their originality. In other respects the bill is much like those drawn elsewhere, and seems to be lacking in none of the important requirements which the others contain. In one respect the Massachusetts drafters have an advantage over the others, for it has been the custom in that State to vote long tickets, that is, to group their candidates for national, State, and county officers upon one ballot, and those for municipal officers upon another. In this State, on the contrary, we are accustomed to a large number of short tickets. Still, the principles of the proposed reform can be applied equally well without regard to the number of ballots.

GRANT—BADEAU.

THE publication of a correspondence between Col. Adam Badeau and Gen. Grant, which took place a few months before the death of the latter, recalls one of the saddest chapters in the country's history. We presume that nobody has read this correspondence without thinking, first of all, that the conclusions announced by the General as his final summing up of Badeau's demerits ought to have been reached long years before, and that Badeau was only one of a long procession of his confidential friends and intimates whose summing up in any just sense would have been of the like tenor and effect. Nothing could be more crushing than the statement of the General's belief that an agreement to pay Badeau $1,000 per month for literary work on the Memoirs after his (Grant's) death would never come to an end. The whole letter is an arraignment more terrible to a sensitive, high-minded man than any order of battle that the author of it ever drew up. How Badeau could bring an action at law against the widow or the estate of the General, knowing that these letters must come out as a consequence of the action and a necessary part of the defence, is a mystery, and the only mystery, perhaps, in the case. We do not wish to prejudice the jury or court who may have to try the issues raised, but we take leave to express a literary judgment suggested by the correspondence. Badeau says in his letter to the General of May 5, 1885, speaking of the Memoirs, and contrasting them with his own military History:

"Yours is not and will not be the work of a literary man, but the simple story of a man of affairs and a great General. Proper for you, *but not such as would add to my credit at all.* With your concurrence I have striven to make it such. But your book has assumed an importance which neither you nor I anticipated last summer. It is to have a circulation of hundreds of thousands, and the larger its circulation, the larger its importance, the more com-

pletely it will supplant and stamp out mine. The better I help you to make it, the more effectually I destroy what I have spent my life in building up—my reputation as your historian. And this nobody but me can do. No literary man has the military knowledge; no military man has the literary experience; no literary or military man living, not one of your old staff even, has one tithe of my knowledge and experience on this subject, the result of twenty years' study and devotion and labor."

Military men will judge of the relative stations of Grant and Badeau as captains. Our judgment is that Grant's literary work is as much superior to Badeau's as his military services were more important than Badeau's in the war of the rebellion. The present correspondence only serves to heighten the contrast.

But the value of this correspondence arises from the fact that Gen. Grant's eyes were opened at last, and before they were closed for ever, to one of that series of mistakes of judgment which made his two terms of the Presidency a burning shame to his country. It is not an agreeable task to recall these things. Perhaps we had best let Senator Hoar of Massachusetts do the summing up under this head. In his speech on the Belknap impeachment case, May 6, 1876, Mr. Hoar said:

"My own public life has been a very brief and insignificant one, extending little beyond the duration of a single term of Senatorial office, but in that brief period I have seen five judges of a high court of the United States driven from office by threats of impeachment for corruption or maladministration. I have heard the taunt, from friendliest lips, that when the United States presented herself in the East to take part with the civilized world in generous competition in the arts of life, the only product of her institutions in which she surpassed all others beyond question was her corruption. I have seen in the State in the Union foremost in power and wealth five judges of her courts impeached for corruption, and the political administration of her chief city become a disgrace and a byword throughout the world. I have seen the Chairman of the Committee on Military Affairs in the House, now a distinguished member of this court, rise in his place and demand the expulsion of four of his associates for making sale of their official privilege of selecting the youths to be educated at our great military scnooi. When the greatest railroad of the world, binding together the continent and uniting the two seas that wash our shores, was finished, I have seen our national triumph and exultation turned to bitterness and shame by the unanimous reports of three committees of Congress, two of the House and one here, that every step of that mighty enterprise had been taken in fraud. I have heard in highest places the shameless doctrine avowed by men grown old in public office, that the true way by which power should be gained in the Republic is to bribe the people with the offices created for their service, and the true end for which it should be used when gained is the promotion of selfish ambition and the gratification of person al revenge. I have heard that suspicion haunts the footsteps of the trusted companions of the President. These things have passed into history. The Hallam, or the Tacitus, or the Sismondi, or the Macaulay who writes the annals of our time will record them with his inexorable pen; and now, when a high Cabinet officer, the constitutional adviser of the Executive, flees from office before charges of corruption, shall the historian add that the Senate treated the demand of the people for its judgment of condemnation as a farce, and laid down its high functions before the sophistries and jeers of the criminal lawyer?"

The picture drawn by Mr. Hoar was less than the truth, much less. He made no reference to the Leet & Stocking scandal, the then pending Babcock scandal, the San Domingo embassy, the Cramer embassy, the Black Friday gold speculations, or to the long train of "mind-poisoning" which led the General to treat every man as his personal enemy who ventured to protest against any of the rascalities that were going on under the protection of his shield and buckler. The revolt of 1872, although unsuccessful and covered with ridicule, was one of the most respectable events in all our political history, and would easily have carried the country if Adams or Trumbull or any man of that stamp had been nominated instead of the erratic Greeley. It was an honest, manly protest against the things that Senator Hoar at a later day opened his lips to condemn, and was only prevented from being successful by one of those ironical accidents which so often bring defeat and humiliation to the better cause.

We have always maintained, however, and we now repeat, that the Republican party rather than Gen. Grant was to blame for those misfortunes and scandals. By taking a simple and inexperienced soldier, honest and faithful, but whose training had been wholly in the tented field, and whose mind knew only the one rule of obedience to those above him and obedience from those below him, the party became responsible for whatever flowed naturally from such premises. While the occasion seems to call for some reference to these things, nobody can read the General's letter to Badeau, written in his pain and weakness, and almost in the presence of death, without infinite pity, and renewed admiration for the really great qualities of the man.

BOULANGER AGAIN.

At the recent elections in France, Gen. Boulanger was found to have been a candidate in various constituencies, and to have received heavy votes, and he was suspected, with more or less foundation, of having actively promoted his own candidacy. This brought him once more to the surface as the idol of the Parisian Radicals, who began to prepare demonstrations, or, as they call them, "manifestations," in his honor, and leave of absence to visit the capital was, therefore, refused him. He appears, however, to have got the political bee in his bonnet to such a degree that he disregarded the refusal, and came to Paris three times, twice in disguise. This extraordinary performance on the part of a general officer in high command has led to his being deprived of his command. There was nothing else to be done with him. As a soldier he appears to have been ruined by politics, and into politics he will probably now go, head and ears, and perhaps start an Anti-Poverty Society.

His career furnishes a striking illustration of the great difficulty of working Republican institutions in the presence of a large standing army — and of glorifying the soldier's trade on all public occasions, as French statesmen are obliged to do — without creating or fostering the popular demand for a military hero. It is much easier now for soldiers to dabble in politics than it was at the time of the *Coup d' État*, because now almost the whole male population is either put into the army or brought into the closest connection with it. The old Napoleonic army, small in size and largely composed of substitutes and old soldiers, is a thing of the past. Every able-bodied man in France is now either in the regular force, or in the reserves, or in the "territorial." Consequently, in a certain sense, the army is the nation, and the nation is the army. In most French newspapers there is as much space given to military news and gossip as ours give to Washington correspondence or theatrical news. Therefore a general who wants to cut a figure in politics has only to make himself popular with the troops by displays of an easy, indulgent temper, or of great concern about their physical comfort, in order to make himself available as a candidate for some sort of political honor. The worst of it is, too, that when a soldier gets into politics in France, he is rarely fit to deal with any but military affairs, and has to maintain himself by the display of zeal for the efficiency of the army. To do this, he is obliged on all occasions to magnify the dangers to which France is exposed at the hands of foreign enemies, and to dwell on the necessity of being constantly ready for a terrible conflict, or, in other words, to fan the flame of hostility to or jealousy of some foreign Power, which has so long been the curse of France, and in 1870 came near being her ruin.

Moreover, the necessity of having a soldier always for the Ministry of War gives the military demagogue a pedestal, as it has done in the case of Boulanger. It would mortally offend the army in France, as, indeed, in every country of the European Continent, to put a civilian at the head of the War Department. The tradition which makes any commissioned officer the moral, if not the social, superior of all civilians, or "pékins," as they are called in French military slang, is not as strong in France as in Germany, but it is very strong. The spectacle of a man in a black coat giving orders on military matters to a man in uniform runs counter to all French notions of propriety. Consequently, the Minister of War has always to be a general. If he be a modest, quiet man without ambition, and with a proper respect for the civil power, and no disposition to magnify the army, his office brings him little fame or profit. He passes unnoticed from the stage with the crowd of Ministers whom the French Chambers employ and dismiss every year with so little respect or compunction. If, on the other hand, he determines to make it a stepping-stone to something else, he does as Boulanger has done—"organizes" with feverish activity, and pretends that Bismarck is coming, and that the future is uncertain, and that France needs some sort of redemption, and that the friends of peace are in the pay of the foreigner.

The decision and energy which the Ministry have shown in dealing with Boulanger is very commendable, but then it must be admitted that he has delivered himself into their hands by playing the mountebank. Whether they would be equally successful in disposing of a shrewder and more cautious military schemer, remains to be seen.

DR. DIX ON IMPURITY.

THE annual outburst of indignation against the morals and manners of New York society in which Dr. Dix of Trinity Church indulges, is this year more than usually severe. We are sure he means well, and is animated by a real horror of vice and immorality—that is, that he draws these dreadful pictures of our social life with a view to the promotion of purity. This being so, no apology is needed for calling his attention to two or three considerations which he has evidently overlooked. Nothing needs more careful handling, either in the pulpit or in the press, by any one who aims at moral reform, than the vice known as licentiousness. As we pointed out when Mr. Stead began his crusade against it in England, it differs from all other vices in that if you describe it with any minuteness, no matter how many opprobrious adjectives you throw in, you promote it. It appeals to the imagination in a way which no other sin does. Consequently, the preacher who thinks he is making his invective more potent by describing the wickedness at which it is aimed, saws off the branch on which he is sitting. He makes two sinners for the one he brings to repentance.

We cannot say that Dr. Dix has made this mistake, but he has fallen into that of exaggeration, to which the preacher on this subject is even more prone than the mistake of minuteness. Impurity has been a favorite theme of preachers ever since the foundation of Christianity, but probably no man ever became the deadly and active foe of this vice without becoming feverish over it. Human nature asserts itself by magnifying in his mind the horrors which he seeks to extirpate. All the saints who made the best fight against licentiousness were perpetually pursued by the Devil of Uncleanness, and always pictured the society in which they lived as wholly given over to him and his works. Dr. Dix is evidently not exempt from this hallucination. He feels so strongly about impurity that he evidently sees traces of it in nearly every man and woman he meets, and detects it lurking in all the manners and amusements of his time. He is even able to follow it into "the unchaste slumbers" "of the silly fool dreaming of her admirers." Consequently his rhetoric about it is very fervid, and yet on no subject should speech be calmer and more careful in order to be effective. He forgets that every one whom he can possibly influence knows fully as much as he knows about the extent to which society is stained by this vice—probably most people a great deal more than he knows; and if they find him exaggerating or indulging in unmeasured accusation, they close their ears against him. They say that he looks at the world through the windows of his imagination, and that through this medium everybody sees what he expects to see.

Finally, let us add, Dr. Dix, in telling his congregation about the dreadful illustrations of ancient impurity to be found in Clement of Alexandria, forgot that Clement was telling Christians about the practices of the heathen. Dr. Dix in his lecture was telling the heathen about the practices of the Christians. One effect of this, we fear, will be that our heathen, hearing from so good an authority what the state of morals is among professedly religious people, will take fresh heart, and pursue their own abominations with renewed vigor. Tens of thousands of pagans, we are sure, on reading the highly colored account Dr. Dix gives of the state of things within the Church, will flatter themselves that they have still a very respectable balance at the Devil's bank, which may be exhausted without bringing their credit any lower than that of the bulk of attendants on public worship.

In fact, one can never watch attacks on this particular vice with which Dr. Dix is contending without being struck by the enormous dangers of failure to recognize, that in attacking it we are trying not to extirpate, but to restrain within reasonable limits. We make these criticisms on his methods with reluctance, because we believe he is fighting the battle of high thinking and plain living against greater odds than a preacher of righteousness has ever had to meet in a great capital. In no capital that we know of does the cause of religion and morality derive so little support against luxury from intellectual interest or activity of any description. This interest has its place here, but it leads a sickly existence as yet under the shadow of great wealth which cares not for it.

RECEIPTS AND EXPENSES OF THE GREAT NATIONS.

AT the last meeting of the International Institute of Statistics, a detailed comparison of the revenues and expenditures of seven of the leading States of Europe was given by M. Cerboni, Superintendent of Accounts (or, perhaps, we should rather say, Auditor-General) for the kingdom of Italy. The total receipts and expenditures for the different nations for the year 1885-86 were as follows:

	Receipts.	Expenses.
Austria	$380,000,000	$382,000,000
England	465,000,000	480,000,000
France	602,000,000	583,000,000
Germany	477,000,000	478,000,000
Italy	282,000,000	286,000,000
Russia	613,000,000	624,000,000
Spain	167,000,000	175,000,000
Total	$2,986,000,000	$3,008,000,000

The budget for Germany includes that of the smaller States of the German Empire; the figures for Hungary are included in those of Austria. All figures are reduced on the basis of five francs to the dollar.

We subjoin those of the United States for purposes of comparison:

	Receipts.	Expenses.
United States	$336,000,000	$242,000,000

The sources of income (classified for convenience' sake on a slightly different basis from that of M. Cerboni) are as follows:

Land tax	$281,000,000	
Income tax	216,000,000	
Other direct taxes	93,000,000	
Total direct taxes		$590,000,000
Customs	$415,000,000	
Tobacco	216,000,000	
Spirits	483,000,000	
Administrative & stamp taxes	346,000,000	
Other indirect taxes	282,000,000	
Total indirect taxes		1,742,000,000
Post-office		193,000,000
Railroads (net earnings)		111,000,000
Other public property		158,000,000
Miscellaneous receipts		192,000,000

The difficulty of classifying the income in the different States of the Union makes American figures unavailable for comparison.

The income from property is by far the greatest in Germany, where it constitutes more than one-third of the total receipts. Austria and Russia have property whose income is in each case somewhat less than one-quarter that of Germany, while the figures of the other countries for this head are only trifling. The proportion of direct taxes is, on the whole, more constant than that of any other item in the budget. Of indirect taxes, the figures for England and Russia are made much larger than the others by the tax on spirituous liquors, which produces over $200,000,000 in Russia, and about $120,000,000 in England.

The expenditures are divided under the following main heads:

Fixed charges.	Total.	P.ct.
Interest and pensions	$1,052,000,000	35
Army	620,000,000	20½
Navy	190,000,000	6½
Civil and miscellaneous	1,146,000,000	38

Comparing the same expenses in the United States, we find the following results:

	Total.	P.ct.
Interest and pensions	$114,000,000	47⅛
Army	34,000,000	14
Navy	14,000,000	5⅞
Civil and miscellaneous (including Indians)	80,000,000	33

The interest on the public debt of the different countries is as follows:

Austria	$118,000,000
England	119,000,000
France	201,000,000
Germany	72,000,000
Italy	104,000,000
Russia	149,000,000
Spain	54,000,000
Total	$817,000,000

The interest on the public debt of the United States for the year named was 50½ millions, or less than that of any of the countries in the table. This fact, however, means little, on account of the failure to include State debts in this total. It is significant that the United States spends for pensions more than any of the countries in the list, and about two-fifths as much as all of the seven put together.

The most interesting part of the whole exhibit is that with reference to the war expenditures (army and navy combined):

	Total.	Per cent. of budget.	Am't per inhab.
Austria	$63,000,000	16⅓	$1.61
England	174,000,000	36	4.69
France	161,000,000	27½	4.22
Germany	111,000,000	23	2.36
Italy	68,000,000	23½	2.28
Russia	198,000,000	31	1.91
Spain	35,000,000	20	2.06

The last column shows certain rather surprising results, England having a greater

expenditure per head of population than France, and twice that of any other country in the table. As a matter of fact, the basis of comparison is not thoroughly fair to England, whose colonial population should to some extent be taken into account in any comparison between population and military expenditure. Nor do these figures give any just idea of the burden imposed upon the different countries, as M. G. de Laveleye remarks in the *Moniteur des Intérêts Matériels*. The figure of $1.91 for Russia probably represents a more burdensome effort, in the existing industrial conditions of the country, than that of any other nation in the whole column. The different items of civil service present an interesting study. The Treasury Department costs more than one-third of the whole, the Department of Public Works about one-quarter, Education and Church one-seventh, the Department of the Interior a little less, and the Department of Justice about one-twelfth. The other expenditures are of comparatively trifling importance. The Treasury Department is relatively most expensive in Austria; the Department of the Interior in England; that of Church and Education in France; that of Public Works in Germany. It need hardly be added that Russia is the country which spends the most for its prisons; in fact, Russia loses by its prisons many times the amount which it saves by the absence of parliamentary expenses.

It is easy to exaggerate the importance of these figures; but it is none the less true that their general results are in the highest degree significant.

LEROY-BEAULIEU ON THE STATE OF EUROPE.

PARIS, March 8, 1888.

EUROPE is in that nebulous state which the modern astronomers represent as having preceded the formation of stars and constellations. One constellation is formed already. Since the publication of the treaty made between Prussia and Austria, and the revelations made on the subject of Italy, we cannot be ignorant of the existence of what is already called the new Triple Alliance. But in the face of this great constellation formed by the two German empires and by Italy, many eyes have already seen the lineaments of another constellation formed by France, Russia, and perhaps even a third power. There is a fable of Florian's, in which figures one of those astronomers who operate in the streets, and permit the public, for a small remuneration, to see the moon and the rings of Saturn and all sorts of fine things. A rat has entered the telescope, and obstructs the rays of light. When the astronomer says to the man who looks in the glass, "Now, don't you see the fine comet with its tail?" the man timidly answers, "Je vois bien quelque chose, mais je ne distingue pas bien." That is exactly the experience of those who have been watching the formation of that new constellation, France and Russia; they see something, but they cannot say exactly what.

The subject has been thought of sufficient importance for the insertion in our *Revue des Deux Mondes* of a mysterious article, without a signature, on the subject of the Franco-Russian alliance. The author begins by showing the character of the Triple Alliance, and makes great efforts to prove that it has not the solidity which Prince Bismarck attributes to it. The elements of frailty are found in the constitution of the Austrian Empire, in the multiplicity and variety of interests of the populations of this empire; they are found also in the state of the Italian peninsula, in the divisions of its parties, in the finances of Italy, etc. These critical considerations are not without importance, but the author has perhaps exaggerated their value. Of course it is difficult to tie together millions of men for any length of time; but when the compact is made merely for defensive purposes, when it has only, if I may say so, a negative character, when a constant appeal can be made to the love of peace of the populations—the small differences disappear, and the alliance does not incur the dangers which it would incur if it had positive objects, and was intended for conquest and territorial changes.

The author of the article which I mention has rendered a service in telling the truth about the relations of France and Russia. These relations have a friendly character, but there is no treaty of alliance between the two countries; there has not been any negotiation preparatory of such a treaty. There are newspapers in both countries which advocate a common action, and try to show a community of interests between Republican France and autocratic Russia; but on one side France, as a whole, may be said to be intensely pacific; and on the other the Emperor of Russia is equally pacific, and, in his empire, the press has no influence whatever. Prince Bismarck, in his last great speech, spoke of it with contempt; he said that he had the greatest confidence in the pacific assurances of the Emperor, and he had this part of his speech only telegraphed to all the foreign ministers of Prussia.

It would be most dangerous to deceive the French people by the promise and the assurance of a Russian alliance; it is always better to know the exact truth. The Emperor of Russia lives in complete isolation, like one of the gods of Wagner: he sees at very rare intervals his Minister of Foreign Affaires, M. de Giers; at much rarer intervals the ambassadors of the great powers. He is probably almost wholly ignorant of all the noise which has been made on this question of a Franco-Russian alliance. Everybody expected that, after the speech of Prince Bismarck, he would be beside himself, and do something; he has done nothing. The diplomatic correspondence of M. de Giers has gone on as usual; we have had the same perpetual appeal to the Treaty of Berlin, but no active resolutions have been taken. Russia can wait, and the words of Prince Gortchakoff are still true: "La Russie ne boude pas, elle se recueille."

In the present state of Europe, it is of the highest interest to know what England thinks. The anonymous writer in the *Revue des Deux Mondes* (who is now known to be M. Leroy-Beaulieu, the author of a book on Russia) does not say much about England; but England is a free country, and it is easier to know what is thought in London than what is thought in St. Petersburg. In the freest countries in the world, however, there are things which cannot be said too loudly. It is generally thought now that some time ago Prince Bismarck made an effort to induce England to join the Triple Alliance; it is said, also, that Lord Salisbury was not as adverse to this policy as were other members of his Cabinet. Lord Randolph Churchill is considered as having made the strongest objections to the adhesion of England to an alliance which might force her, under certain circumstances, to become as active in the affairs of the Continent as she had been in the time of Napoleon I. Without being absolutely an advocate of non-intervention, as a political doctrine, he thinks that the new House of Commons, elected by larger constituencies, is more pacific than its predecessors, more desirous to circumscribe the questions and interests which England must consider vital.

Lord Randolph Churchill's recent journey has been much remarked; and so has the recent speech in the French Chamber of Deputies of the young Marquis de Breteuil, who also made recently a journey to Russia, and who was there received by the Emperor. M. de Breteuil, in his maiden speech, did a very bold thing; he made an *exposé* of the whole European situation, and, as he had just come from Russia, he was listened to with much curiosity by the Republican majority as well as by the Monarchical Right, to which he belongs. (The Deputy from the Basses-Pyrénées is the grandson of M. Fould, who was the Finance Minister of Napoleon III.; he is also the great-grandson of the Breteuil who played a part at the time of the French Revolution, and was one of the favorites of Queen Marie Antoinette.) The French Minister of Foreign Affairs made no answer to M. de Breteuil's speech, having been asked no questions. We must therefore look upon this maiden speech merely as a sort of academic discourse. I have mentioned it only as a sign of the desire which exists in some circles to bring about an understanding between France and Russia, and to induce England to enter this new combination of political forces.

This last attempt seems to me quite chimerical. England, it is true, was always opposed to the predominance of a single power in Europe; history shows her as the constant defender of the European equilibrium. She has in turn opposed the hegemony of Spain and of France; is it time for her to oppose the hegemony of Germany, a power to which she is attached by so many ties? Can the present policy of Prince Bismarck be compared to the policy of Napoleon I.? We don't know what may happen under the reign of another Prussian monarch, if he should be an ambitious man, if he should lend an ear only to the military party. For the present, the sentiments of Germany are well described in the last speech of Prince Bismarck: she feels more threatened than threatening; she probably feels more threatened than she really is. England has nothing to fear from her. It is said at times that, on the death of the present King of Holland, Germany will try to bring the Netherlands under her hegemony, in some form or other; she is said to look on Amsterdam, Rotterdam, and even Antwerp with envy. It is said that she will eventually annex the German-speaking part of Switzerland. All nations have such dreams; but accomplishment is another thing.

At the present moment, England has preserved entire liberty of movement; her hands are free, and it is well worthy of remark that Mr. Gladstone did not endorse the opinions of Mr. Labouchere when the latter recently attacked the foreign policy of Lord Salisbury's Administration. It is difficult to see what reasons could induce England to accept undefined responsibilities; she has theoretically nothing to object to alliances of which the aim is peace, but she would be very unwise if she entered into any compact which could impose on her the necessity of war. The Triple Alliance is a positive fact, a brute fact; all the combinations which we have spoken of are, so far, mere aspirations.

EXCAVATIONS IN ATTICA.

ATHENS, February 16, 1888.

IT will perhaps be remembered that, for two years before the beginning of the current year, the American School at Athens had busied itself with excavations. The small theatre of Thoricus, a remote township of Attica, was

successfully and thoroughly discovered, and last year considerable excavations were made in the theatre of Sicyon, a Peloponnesian town where Clisthenes the elder attempted the earliest recorded censorship of the theatre. These Sicyonian excavations have been brought to a close. They will hardly be resumed unless it be deemed advisable to lay bare the auditorium. The orchestra and the stage, with both the entrance-ways, have been cleared, and such measurements as are useful have been obtained.

Of this year's excavations at Sicyon, Mr. Earle of Columbia has had the direction. He has been fortunate in finding first the head and afterwards the trunk of a very beautiful statue. Beautiful it is, although it may never be possible to decide whether it represents Apollo or Dionysus, or even to be sure that it is not an idealized portrait-statue. A very charming female head was also added to the collections of the Central Museum at Athens as the result of the American work at Sicyon.

The discoveries at the theatre of Assos, reported by our compatriot, J. T. Clark, supplemented by the results of American excavations in the theatres at Thoricus and Sicyon, have familiarized our studious countrymen with unsolved problems that still abound in regard to the theatre of the Greeks and the myth and worship of Dionysus. It is not surprising, then, that the next venture of the American School should deal with matters closely related still to the theatre and to Dionysus.

The excavations now in progress are under the direction of Mr. Buck of Yale. They began this month, and have been interrupted once by a very heavy fall of snow; for, although heavy snow is unknown in the plains of Attica, the higher mountain valleys are not similarly exempt. The work is going on near the ruins of Byzantine Church. This church-ruin lies upon an alpine farm which has borne from time immemorial in peasant speech the name "Stó Diónyso" ("Diónyson" is the official term), a name full of suggestion to the hopeful archæologist. From Stamatovuni, the height at whose base this ruined church is found, there are two glimpses through the mountain wall that towers in front of Marathon. Towards the left is seen, in shape most like a crescent, the placid Marathonian Bay. The mass of Aphorismós, a bulwark of Mt. Pentelicus (Brilessus), hides the nearer breadths of Marathon, and leaves chiefly within view the northern plain and the marsh so fatal to the Persian host. Gleaming in the furthest distance can be seen, beyond the straits, Eubœan mountains, near the ancient town of Styra.

Our excavations were undertaken at Diónyson, in the hope of completely unearthing a choragic monument which had apparently been used as the apse of the church. The ancient architrave of the monument lies near at hand, with the names of those patrons of the chorus (*choregi*) who built it to commemorate their triumph in a tragic competition held in Dionysos's honor. This inscription was published long since by Chandler, and afterwards by Boeckh, but closer inspection shows that the first of the three proper names has been misread: it is ΑΓΝΙΑΣ and not ΑΙΝΙΑΣ. But this monument was not all that fixed the attention of the Director of the School, Prof. Merriam, upon Diónyso. He also hoped to prove that the adjoining Stamatovuni, which is still covered with traces of ancient terrace walls bearing witness to the former culture of the vine, might be identified with the Mount Icarius much celebrated in connection with the myth of Dionysus's first reception in the land of Attica, and with the culture of the vine, a gift from Dionysus to the ancient King Icarius. King Icarius, of course, was the eponymous hero of the Attic township of Icaria, and the only possible way to reach Mount Icarius would be by discovering a mountain at whose base the townsmen of Icarius dwelt. Besides the inscription on the architrave already mentioned, Dr Arthur Milchhöfer several years ago found another at Diónyson, and reported various observations there made, which encouraged Prof. Merriam in expecting to identify the spot as the long lost township of Icarius and of the Icarians. These expectations have been more than justified.

To begin with the choragic monument visible in the apse of the church. Excavations behind the church, directly east of its choragic apse, were made. Here all the pieces of the monument necessary for an approximately accurate restoration of its shape were found. Removal of the earth covering the foundations at the southern side of the apse revealed in their upper course a large stone carefully shaped like its mate, which had been found under two feet of earth at three yards' distance. These two stones, one of which the church builders rejected, were undoubtedly at the two western extremities of the uppermost course in the semicircular wall of the choragic monument, for they are carefully cut so as to receive the inscribed architrave above mentioned. Hence the choragic monument was not incorporated in the apse of the church until it had first been pulled down. The flimsiness of the apse foundations leads one to surmise that even these are not the same with those of the ancient monument. Various questions immediately suggest themselves. If the monument was not where the apse of the church is, where was it? Why did the church builders deem it necessary to tear down a structure which plainly was in the exact shape required for the apse of their church? They needed only to tear away the façade of the choragic monument and build on the requisite nave of their church. Possibly the monument faced the wrong way, towards the east; then it would have been absolutely necessary for them to pull it down, and they may have built it up very nearly upon its original site. This is at least suggested by the fact that they certainly took one stone (the shape of which made it very inapt for a solid substructure) from the topmost course of the choragic monument and placed it in the foundation of their apse. What was within this semicircular monument—if its circle were completed, it would be about two-thirds the size of the well-known choragic monument of Lysicrates—and whether or not it supported a tripod, cannot yet be satisfactorily made out.

As for the second point, to elucidate which Professor Merriam had these excavations begun, that has been most satisfactorily disposed of. Diónyson is undoubtedly upon the domain of the ancient Icarians. It has rarely been possible more conclusively to identify a township in Attica by means of inscriptions. Gravestones bearing the name of this or that township in Attica are constantly found at and near Athens in great numbers, when only one or two are unearthed on the site of the deme itself. It is, of course, a commoner thing to find gravestone inscriptions than inscriptions of any other sort, and they tell us less than other inscriptions do. Yet Dr. Lolling, who certainly has a right to speak with authority on Athenian topography, argues in a paper on the Marathonian tetrapolis that the discovery at a distance from Athens of even one or two gravestones, with the name of a given township upon them, establishes a presumption in favor of locating that township where such gravestones were found. At Diónyson, however, the number of inscriptions, various in kind, upon which the name ΙΚΑΡΙΕΥΣ occurs, is very exceptional. About one gravestone found not far away I shall speak anon; apart from that two others, a votive and a sepulchral inscription, have been found, and one decree, all which contain the name. But the conclusive proof is contained in a second very long decree, which has been found there in an absolutely complete condition.

These inscriptions, together with much else to be described presently, were unearthed by digging on the north side of the church ruin. The words inscribed upon the decisive slab are to the following effect:

"Callippus was the mover. *Voted* by the Icarians to commend and to crown Nicon the town clerk (*demarchos*), and that the crier shall publicly proclaim that the Icarians and the township of the Icarians do crown Nicon with a crown of ivy, for that right well and duly he hath ordered the festival of Dionysus and the competition. *Voted* also to commend the patrons of the chorus (*choregi*), Epicrates and Praxias, and to crown them with a crown of ivy, and further that the crier shall make the same proclamation in regard to them that was ordered for the town clerk."

Proof could not be more complete had the inscriptions been made to suit the need of archæologists in despair at the fashion in which Icaria has been driven from pillar to post through all the length and breadth of Attica. In the above inscription the frequent but not exclusive use of ο for ου shows that the decree belongs to a time before the double use of ο had been completely abandoned. The decree therefore must not be placed later, and probably should be placed much earlier, than the third century B. C.; it belongs, perhaps, in the fourth century.

A number of other inscriptions have been found on the same (north) side of the church, and, when the walls of the church shall have been pulled completely down, others will no doubt appear. Already as I write news comes of one inscription which the rain has uncovered on a stone, laid bare by digging away the earth from the foundations. Curiously enough, most of the workmen at Diónyson are mortally afraid of taking part in the further pulling down of the church. They are ready enough to dig anywhere and pull down anything outside of those, to them, still sacred walls. In Athens, near the cathedral, stands a church more dilapidated than the one at Diónyson; but within its roofless apse a light still burns, and votive offerings still are laid upon its wind-swept altar.

Among the inscriptions found outside the church at Diónyson, there is one boundary-stone which partakes of the nature of a bill of sale, and another boundary-stone which has reference to a dowry and to a mortgage involved in its payment. Furthermore, sure traces of votive slabs and statues have been found up to the number of fifteen. By excavations made in front of the church (that is, west of it), a marble double seat or throne has been brought to light. If there should eventually prove to exist traces of a temple near at hand, the suggestion might then be hazarded that here we have the double seat occupied by the temporal and the spiritual powers of the Icarian demesne, by the priest of Dionysus and by the representative of Dionysus's old-time friend Icarius, the town clerk of Icaria. If there was no temple here, the numerous votive offerings prove at least that there was a sanctuary. This is confirmed by one imperfect inscription just found where there seems to be made provision for the erection or repair of "the statue."

Moreover, three bas-reliefs, all of them without much doubt funereal, have been found. One of these appears to contain three figures, two standing and one sitting. This is undoubtedly the familiar scene of parting so usual on Athenian tombs, and yet always so singularly and adequately appropriate. Both of the other reliefs are in the most excellent state of preservation. One of them represents a bearded man of middle age, who stands in profile gravely looking forward. A staff rests on his left arm and shoulder, and he was probably bidding the last farewell to the dead, whose image was no doubt upon the missing half of the slab. The other bas-relief represents in profile an extremely beautiful lady. She is seated with her right side towards the spectator, and her right arm lies in most graceful repose outstretched upon her lap. Something she seems to hold in her right hand. This she may have taken from a casket proffered by her handmaiden. If the casket-bearing handmaiden be imagined as having occupied the missing right-hand portion of the slab, then the monument of Hegeso, the most beautiful in the Ceramicus, will help supply what here has not been found. But there is much still left that we may admire, for the action of the lady's left hand is the most charming feature of this truly delightful work of art. Like the sitting figure on a far inferior funeral bas-relief now in the Central Museum here, this lady is delicately lifting from her breast, with her left hand upraised, the exquisite fabric in which she is draped. No words of affectionate remembrance could better interpret the subtle graces of a life so beautiful that mourning for its loss was a grief transmuted into wonder.

The statues discovered have their importance also. Among them the most important is a more than life-size torso of a male statue. From its considerable size, taken in conjunction with mention in the inscription above alluded to of "the statue," it seems possible to surmise that here we have the important Statue of the Sanctuary at which so many offerings were made. It may be even that this is a statue of Dionysus which belonged in the still undiscovered Temple of Icaria. The curious persistence of the name of Dionysus applied to the immediate neighborhood gives at least encouragement to further search. The mention of a Dionysiac competition in the long decree above cited suggests even that somewhere here once stood a rural theatre.

There was also found a very pretty female head and the torso of a draped statue of a woman. This is about all that has been met with up to the present moment at Diónyson proper, or, let us now boldly say, at Icaria. But Mr. Buck has been elsewhere. Hearing from his men of *grammata* to be found at a distance, he went with them to a point about two miles further inland, and was there rewarded by discovering a tombstone with the following very beautifully cut inscription (the two bracketed letters are conjectured):

[Π]ΑΝΤΑΚΛΗΣ
[Π]ΑΝΤΑΙΝΕΤΟΥ
ΠΑΩΘΕΙΕΥΣ
ΧΑΙΡΑΜΕΝΗΣ
ΔΙΟΔΟΤΟΥ
ΙΚΑΡΙΕΥΣ

This establishes a certain probability in favor of supposing the township of Plotheia to have been near the place where this stone was found, and suggests an intimate and neighborly connection between Plotheia, the township of Pantaenetus's son Pantacles, and Icaria, the township of Diodotus's son Chaeramenes. At all events this gravestone is interesting and almost, if not quite, unique, as being a well-authenticated case where two township names —always excepting the gravestones of husband and wife, or cases of adoption—are found upon a gravestone unearthed away from Athens and Peiraeus.

The good workmanship exhibited by this gravestone, the ancient manner of spelling exemplified in the long decree, the admirable quality of the bas-reliefs, the semi-archaic art of the horse of Dionysus, certainly justify us in ascribing most of these works to the fourth century B. C., and some even to an earlier date. On the other hand, the female head and horse belong to the Roman period, say to the second century A. D. We have accordingly in the monuments discovered at Diónyson a range of 600 years, during which Icaria was an important centre of rural Attic life. And now a fortunate consonance between facts already known and those which these excavations add to our stores leads us back further than the fourth century B. C., and we are enabled to learn something of the political status of the township of Icaria in the all but prehistoric days before the whole of Attica was united by King Theseus. In those early times there had been, as Thucydides implies, a very loose federation among the political units of Attica. These, tradition tells us, were twelve in number, and we know that they were variously grouped together by common sacrifices and festivals. We hear of the tetrapolis of Marathon, covering the townships Tricorythus, Probalinthus, Oenoë, and Marathon. There is an inscription to prove that the citizens of this tetrapolis, as such, joined together for the performance of religious ritual. The same is true of another of these ancient Attic combinations, which bore the collective name of Mesogeia. Can any such group be found to which the ancient Icarians belonged?

The clue to an affirmative answer is found in a well-known Attic inscription, which shows substantially that the Plotheians, whose township Plotheia, was spoken of above as supposably close to Diónyson and Icaria, had to defray ritualistic expenditure, first as Plotheians, second as Epacrians, and third as Athenians. From a not quite hopelessly muddled identical account of Epacria given by two ancient lexicographers, we gather that, at the time of the unification of Attica by Theseus, there existed in Attica (1) two combinations of four cities each, and (2) one combination of three cities, called Epacria. The one city still necessary to make up the traditional tale of twelve was apparently Athens.

Epacria, the superior unit to which the Plotheians belonged, contained, then, in addition to Plotheia, two townships. One of these was Semachidae; for an excellent and ancient authority, Philochorus, is quoted as declaring that the township of Semachidae belongs to Epacria. Plotheia and Semachidae are universally admitted to be two of the three Epacrian townships. Furthermore, these two townships—about the position of which nothing is otherwise known—are always placed in the uplands, near Marathon, because they are known to be Epacrian, and because we have ancient authority defining Epacria as the "name of a district situated near Marathon."

Can we identify Icaria as the third member of this pre-historic Epacrian League? I do not hesitate in saying that we can, for (1) its position near Marathon brings it under the general category of Epacria, (2) there are good reasons, derived from quite independent sources, for believing that Icaria was bound by an exceptionally close tie to both of the two known Epacrian townships. The exceptionally close connection between Icaria and Plotheia is made probable by the gravestone which has just come to light. Icaria's close connection with Semachidae was long since pointed out by Leake, who fixed upon the neighboring Mount Agrieliki as the ancient Mons Icarias. Leake inferred the close neighborhood of Icaria and Semachidae from the strangely identical account of Dionysus's first appearance in Attica, which is connected, *mutatis mutandis*, with both of these townships.

At the time when Demeter came to Attica, and rewarded her good host Celeus ere she went by introducing grain to his notice, Dionysus also sojourned, some say, with King Icarius at Icaria; and others—who are equally trustworthy—maintain that he stayed with King Semachus at Semachidae. We hear of the god's relations with the daughters of Semachus on the one hand, and with Erigone, the daughter of Icarius, on the other. Of these two legends the Icarian ended by winning the day. This was evidently because the Icarians were more important and more numerous than the men of Semachidae. Lucian, who belongs to the very latest stage of Greek letters, mocked at the account of Dionysus's pity for poor Erigone's grief over her father's murder. The god transferred not only her, but her pet dog Maera to the heavens, and made them a constellation there. This tale Lucian declares is too ridiculous to be taken seriously, thus showing that it was much repeated in his day. Elsewhere, in the enumeration of all that a truly well-bred dancer ought to know, Lucian again reverts to the story of Icarius. The vine-planting of Icarius—that is, the story of Dionysus's grateful gift to him of the vine—he mentions in speaking of Attic mythology, which he says every dancer must thoroughly know. It is hardly necessary to read between the lines in order to see that Lucian has in mind the common subjects which dancers interpreted by their art in his day. Accordingly, it is plain that the story of Icarius and Dionysus, and perhaps even the woes of Erigone, formed a not unusual theme for choreographic representation.

The woes of Erigone were, in days far earlier than Lucian's, the subject of a tragedy by Cleophon, a tragedian whom Aristotle twice criticises in the 'Poetics.' Erigone was disconsolate because her father, Icarius, was slain by drunken peasants. Too generously he gave the gift of Dionysus to his neighbors on the country-side. These peasants abused the gift, and, drinking too much wine unmixed, thought Icarius had poisoned them. In haste they slew him, and repented as they grew more sober. This story, which is not without its comic side, appears to have been made serious and tragic by dwelling upon the woes of Erigone, and upon her long efforts to find her father's grave, whither her dog Maera finally conducted her. A peculiarly mournful manner of song called Aletis—a name sometimes given to Erigone—is connected with Erigone's sad story, and we hear of the country custom of hanging tragic masks on trees in her sad memory.

All this may prepare us for the crowning glory of Icaria as the birthplace of Attic tragedy and comedy. In Icaria, Thespis, father of Athenian tragedy, was born. To Icaria came Susarion of Megara, and the first comic chorus, we learn from the Parian chronicle, was composed of Icarians. Indeed, Bergk does not hesitate to say "it is no accident that connects with Icaria the first beginning of tragedy, and of comedy as well."

Truly the spot is worthy to have inspired the initiators of the most heart-searching form of literary art. Deserted now, and far from the

course of travellers, it is unknown. But it is beautiful to-day, for near its ruined church begin fine forests, the very "wilderness of Marathon," through which the poet Statius says Erigone once wandered seeking wood to place upon Icarius's funeral pyre. Here, in recent days, but fortunately past, were secret haunts of brigands now unknown in Greece. The lovely vale of Rapendosia is not far, for it belonged to King Icarius's demesne. There can be seen to-day a memorable picture—a cave hollowed in the sheer mountain-side, where scores of kids are tended by a wild-eyed shepherd boy. He might be called the genius of the place, for he is surnamed Dyonsjótes for the god, and yet so simple in his mind that he well might be one of those poor countrymen of old who repented soon the rashness of their misguided hands that slew Icarius, their benefactor and their king. The place is full of scenes marked by a truly Theocritean dignity and simplicity. With these we may fill our thoughts while waiting for further and detailed accounts of what Diónyson has yielded to the spade. Certainly, so much has been found and so much learned already by excavations there, that the Director and the School should have the heartiest congratulations of its many friends. L. D.

Correspondence.

SENATOR BLAIR'S CONSTITUTIONAL PROHIBITION AMENDMENT.

To the Editor of The Nation:

Sir: Merely suggesting (1) that the recently developed tendency in certain quarters to interpret the provision of the Federal Constitution by which three-fourths of the States must approve any amendment, not as an extra safeguard beyond the ordinary requirement of a two-thirds vote of the legislative body, but rather as a means by which Congressmen may escape responsibility in a delicate question by voting to "submit it to the people of the States," is one of at least doubtful advantage; and (2) that our greatest national danger (now that the civil war has quieted all fears lest the Federal Government should prove too weak to maintain itself) is the same before which other republics have gone down, viz., the assumption by the central Government of powers to which the governed will not submit, yet which they cannot lawfully resist; and (3) that a function so peculiarly in the nature of a police regulation that many States, even, resort to "local option" laws, may be regarded as one of the last which our forefathers would have looked to see undertaken by the Federal Government (imagine Sam Adams in the premises!)—I desire briefly to call attention to one consideration which I have not seen mentioned in the public prints.

The formers of the Constitution, in providing that amendments should receive a two-thirds vote in Congress, and also the approval of three-fourths of the States, doubtless thought that they were establishing the Government on a conservative basis. But the first safeguard is likely to be swept away as already suggested, and an unforeseen concentration of population in a few of the States has so weakened the second that it is possible for a *minority* of the people to amend the Federal Constitution. While ordinarily this might be no matter for concern, since the large States would divide and balance one another, this is peculiarly not true of the question of the prohibition of the liquor traffic. The States which contain great and compact populations, largely composed of foreigners, are the very ones which by almost inevitable sequence will be the last to favor prohibition. Massachusetts, New York, Pennsylvania, Ohio, Illinois, Missouri, and California (in which are almost all of our great cities), with two others of the larger States, contain a majority of the people of the country; yet the other twenty-nine States can engraft their minority views on the Constitution.

The unwisdom of thus meddling with the Constitution is more apparent when we consider that the most important branches of the liquor traffic are already within the control of Congress. The only power to be gained is the power to go into a populous State and enforce a law peculiarly in the nature of a police regulation, involving only the inhabitants of that State, against their expressed will, and perhaps against the will of a majority of the people of the nation.

To a Prohibitionist there is some comfort in the thought that his party existed some years without seeing the need of constitutional amendments, and has never emphasized it. It is a scheme (which may indeed be looked upon as a pyrotechnic illustration of "crankism") devised by the "non-partisan" Republican temperance people, as a means of enacting prohibitory liquor laws without making any one responsible for the enforcement of them.

C. T. Libby.

Portland, Me., March 14, 1888.

A DEPRESSED INDUSTRY.

To the Editor of The Nation:

Sir: The wool associations of this State are so clamorously demanding the high tariff of 1867 for the benefit of their "depressed" industry, that the public is led to believe the sheep interests here are about ruined. Many Colorado people, I imagine, would be surprised to know that our leading agricultural paper, the *Field and Farm*, in answer to an inquiry a few days ago, said the profits of sheep-raising with us are 20 per cent.—whether they arise from mutton or wool is, of course, not the question. The largest and wealthiest sheep man we have says his profits are very large, and still he is leading the cry for more "protection" for his "paralyzed" business. In view of the fact that Colorado sheep-raisers hire cheap Mexican labor, notwithstanding their handsome profits, would it not be proper for them to propose to discharge the "greasers," if the high tariff is reinstated, and employ American labor, since it is insisted that the high wages of our country prevent us from producing wool as cheaply as Australia?

However, an industry that is earning 20 per cent. and employing degraded Mexican labor, and yet is shouting as loudly as anybody for more tariff, doubtless regards "protection" as a game of grab, and is simply trying to make the most of it; otherwise our sheep men would certainly be modest enough to wait with their demands for an advance in profits until all the other Colorado enterprises can succeed, by "protection" or any other means, in earning even 15 per cent.

This clearly illustrates the well-known difficulty with the protectionist theory. Many of the "protected" industries now clamoring for more "protection" may be earning far larger profits than those which are unprotected, and who is able to name them?

Respectfully yours, H.

Denver, Col., March 8, 1888.

LEGISLATIVE FIXING OF FREIGHT RATES.

To the Editor of The Nation:

Sir: In your issue of March 1, I notice the following:

"The proposal to fix rates on freight by an act of the Legislature is, we believe, something entirely new, going beyond anything hitherto proposed in any country in the matter of regulation of railroad property. The utmost that other civilized States have done is to create commissions or boards to consider, through actual judicial investigation, what 'reasonable maximum rates' are. No Legislature has, we believe, thus far taken this task on itself."

About two years ago a disagreement arose between the management of a Michigan railroad and a large shipper in a town which had no other outlet commercially than this railroad, about a railway bridge over a mill-race. As a result, the rates of freight charged this shipper were raised, by reclassifications and other means, direct and indirect, from 200 to 600 per cent. The next result was that the local properties in question passed into the hands of a receiver who is an attorney for the railroad company, the rates are reduced to the old levels, and business proceeds.

To cover such cases of abuse of power as this, an effort was made at the last session of the Legislature to pass a bill fixing a maximum rate on freights per ton per mile. The rate proposed was three cents—between three and four times the average rate per ton per mile in this State, an allowance for switching and loading being made on short hauls. The problem was by legislation to prevent extortion and ruinous discrimination without crippling the railroad interests of the State. This solution was found obnoxious by the railroad interests, who succeeded in defeating it.

I do not see why, at least to the extent of fixing a reasonable maximum rate, legislation fixing freight rates is not good legislation.

Very truly yours, F. W. Ball.

Grand Rapids, Mich., March 8, 1888.

A DENTAL "TRUST."

To the Editor of The Nation:

Sir: In these days of "trusts," monopolies, etc., it may be interesting to the public to know how one of the largest "trusts" in the country has been existing for years, with scarcely a dissenting voice. A few years ago most of the manufacturers of dental supplies formed a combination representing thousands, if not millions, of dollars. Since then, they have systematically attempted to crush every manufacturer that would not join them, and have virtually succeeded. They buy up all the patents that are likely to prove of any use to the profession, and either manufacture the article at a high price, or suppress its manufacture altogether, in order that they may sell others on which the profit is greater.

The principal dental journal in the country (and I may say the world) is controlled by one of the members of this Trust. All general discussion on this subject is in this way suppressed, and unanimity among dentists prevented, so the individual is powerless. To "boycott" such an organization is an impossibility, as it is a duty that every dentist owes to his patients to provide himself with every appliance that will alleviate suffering, without regard to cost, and many of these can only be obtained from this organization.

Although this matter may not interest the public as directly as a "Sugar Trust," yet it does indirectly, and for this reason should find a place in a popular journal. It only needs an awaken-

ing of the dentists to this fact, together with their united action, to end this Trust for ever.

Boston, Mass., March 10, 1888.

VIRGINIAN FREEDOM FROM COLOR PREJUDICE.

To the Editor of The Nation:

Sir: In order to aid you in your laudable effort to relieve Mr. Cable of his "unduly depressed" spirits concerning "The Negro Question" in the South, I write to say that in this town, two or three years ago, a teachers' institute was held in which the white and colored teachers met together. That was the last institute held here. I can't say certainly as to the custom before that time, but judge it was not the first institute held in common by the fact that I heard no remarks about it. I am also ignorant concerning the custom in other places in this State.—Yours truly,

S. T. Moreland.

Lexington, Va., February 10, 1888.

SOUTHERN HOMICIDE.

To the Editor of The Nation:

Sir: Being a regular subscriber and careful reader of your valuable periodical, I have been interested in your several recent articles on the above subject. As I am distinctly a Southerner, and personally acquainted with several gentlemen who have recently figured in desperate "affairs of honor," it may be pardoned if I submit a concise opinion on the subject.

The real source of trouble in the Southern mind is a lack of clear conception of what real honor consists in, while possessing at the same time an *overstrained sense of honor*. For instance, when Gen. Zolicoffer considered himself insulted by the criticisms of a certain editor, he at once armed himself and sought the gentleman, who, on seeing him advance, pulled his pistol and started to fire, but the priming had fallen. The General stood with pistol in hand, and waited until the other man had reprimed his pistol, and then both fired at once—neither being injured. Now, what could more admirably illustrate the nicest sense of honor than this?—and yet it evinces the most lamentable lack of clear understanding of the essence of true honor. To put it tersely, I would say that as to so-called insults which so many men think it necessary to resent, there is just one view of it which will remove every difficulty—*i. e.*, "A *blackguard* cannot insult me; a *gentleman* would not."

Resentment is always a confession of weakness, and never, in any circumstance, evinces strength except where that resentment is exercised in behalf of some one else who is too weak to defend himself. Don Quixote reduced chivalry to absurdity, but many who laugh at his pranks are themselves fully as foolish. Insult only becomes insult when noticed, and on the same principle that a man would not consider it an insult for a cur to muddy his boots, so he need never notice a human cur (or *currish* action) engaged in the like dirty business. True honor is neither in anger nor resentment, but in requiting abuse with a smile, and injury with good.

The only historic man who entirely lived these principles was Jesus Christ—the rest of us have a mixture of brute in us. The more a man resents, the less noble he is. The more a man bears with dignity, the higher his position in the gradation of humanity.

Sincerely, James Wood Pogue.

Nashville, Tenn., March 13, 1888.

VOLAPÜK.

To the Editor of The Nation:

Sir: I have read Prof. Addison Hoge on Volapük with so much interest that I cannot refrain from expressing the surprise, which I feel sure will be shared by many others, at the leniency of his criticism. I am at a loss to understand how any one who has studied the necessities of modern speech and the manner in which the languages of civilized nations change, can for a moment accept this High-German bantling as worthy of being adopted by the world at large. A brief notice of Volapük which I had seen elsewhere, and the advertisements in your columns, had excited in me a desire to acquire some knowledge of the language as soon as possible. But Prof. Hoge has wholly convinced me that I have no time to waste upon such nonsense.

The name is enough for me, with the importance attached to its exact pronunciation. What sense is there in expecting all sorts of people to distinguish between *ü* and *i* when every one knows that in the best German poetry the former more often rhymes with the latter than with itself? The first requisite for a universal language is that the vowel sounds shall be as simple and open as possible; not only to the end that they may be easily learned, but also that their utterance may be grateful to the general ear. The three most euphonious languages of Europe, the Italian, the Spanish, and the Russian, are examples of the effect of few and simple vowel sounds in pleasing all lovers of musical speech. In the Italian language, moreover, the rejection of all aspirates and aspirated gutturals favors the greatest possible rapidity of utterance, combined with perfect distinctness. By all means let us call *it*, *eet*—if we had not lost our ear through the coarseness of our speech, we should perceive that our *it* is only *eet* modified by a boorish sort of grunt—and let us call *met*, *mäte*, for the same reason. Our *at* is a suppressed bleat, and the sound of *u* in *but* can only be matched in Ojibwé. It would be a great benefit to all our children to learn some other language in which the vowels were distinct and pure, and not grunted *à bouche fermée*. But we don't want any *ö*'s or *ü*'s in our universal language.

As to the grammar, the High-German predilections of the inventor of Volapük are strikingly illustrated by the fact that the authorized translator has been unable to render in English some of the auxiliary moods and tenses. True, Seret's qualifications for translating a German grammar of a third language into English seem to be of the slimmest. The sentence quoted by Prof. Hoge: "If November comes, we get snow," evidently should be, "When November shall have come, we shall get snow." Seret has stumbled over so slight a matter as the two-fold meaning of *wenn*. In German *when* and *if* are equivalent in such a sentence, because the speaker assumes that his hearer knows that November must come, and that there is no *if*—in our sole sense of the conjunction—about it. A similar reliance upon the intelligence of the person spoken to has led to our disuse of the subjunctive and other distinctive forms. We have to translate "Sie dürfen nicht" by "you must not," and "Sie müssen nicht" by "you are not obliged," but the uses of the German *lassen* and the French *laisser* show that one word may express both permission and command, and if there were but one construction of the verb for this and other cognate moods, the context would always show plainly enough what was meant.

Instead, therefore, of taking up Schleyer's invention, every English-speaking scholar should protest as loudly as possible against such a flagrant misuse of a great opportunity. We want a common mode of expressing thought easy, clear and rapid in utterance, and simple to the last degree in syntax. It must also be capable of poetical forms, for the earliest speech is always in song; but the author of Volapük was evidently at no pains to make his language suitable for rhyme and rhythm. In the Italian we see how few distinct sounds are necessary for the richest and most musical effect. It is the language which every vocalist prefers for displaying a well-trained voice, and probably every public speaker would choose it, too, if he could. Dante and Petrarch have shown us that such a language is fitted for the finest poetry, and Salvini shows us how readily it lends itself to the vocal expression of every kind of feeling. Again, the Danish language shows us how little inflexion and syntax are required for the lucid expression of the deepest thought and the subtlest shades of meaning. The vehicle employed by the late Bishop Martensen to give his 'Christian Metaphysics' to the world, will express much more than two nations ever do understand of each other's thoughts. If Schleyer had possessed sufficient detachment to take Italian for his model in pronunciation, and Danish for his model in construction, the result might have been acceptable to those who use the English, French, and other languages, as well as to the Germans, and he might have done more to mitigate the curse of Babel indirectly than will probably ever be done directly. For his new speech would then have offered a centre of attraction towards which the languages of the civilized world in their constant but slow movements (like those of a glacier) might converge. At present the tendency is towards divergence.

It is very doubtful if one man, and especially if one German, can so rid himself of national peculiarities and prejudices as to design even a fair model for the tongue which every one will be expected to know, and which may also serve as a sort of centre of attraction for existing languages and dialects. But it seems to me to be certain that the new language must be sweeter and simpler, and *therefore* more refined, than Volapük.—I am, sir,

Yours very respectfully,

Charles J. Gedge.

Nebraska City, Neb., March, 1888.

TOLSTOI'S CHRISTIAN NAME.

To the Editor of The Nation:

Sir: I am informed that a discussion has been going on in America as to the proper pronunciation of Count L. N. Tolstoi's Christian name. I have already contributed to that discussion, in a way, by writing the name as "Lyof" on the title-pages of my translations from his works and elsewhere. From a dictionary point of view, this is perfectly correct; all those misleading authorities are unanimous on this subject. But people who are at all intimate with that kind of literature are well aware that the stories are not only irritatingly short and incoherent, as Mark Twain puts it, but that they are also frequently characterized by a lack of strict truthfulness. Dr. Johnson's definition of *attic* as "the top story in a house," and of *garret* as "the story over the attic" (or vice versa, I have not the book at hand), are famous, and fit companions to R. H. Barham's burlesque "cellar under the bottomless pit." I also know of a Spanish dictionary which makes out a rear-admiral to be a "rare or raw" admiral, and a German dictionary which gives, in all seriousness, the definition of "soldier"

equally with "lobster," for *Hummer*, evidently without a suspicion that the latter is only the street Arabs' playful designation for the red-coated British warrior. But to return to Count Tolstoi. I have amended the error of my ways, and I hope that the admirers of the great Russian will do the same. The proper pronunciation here in Russia is not "Lyof," but "Lyef." My authority is the pronunciation of the writer's friends, disciples, and relatives. How many hours I have spent, within the last week alone, in the society of these relatives, disciples, and friends, it is not worth while to reckon; how many times the beloved name of "Lyef Nikolaitch" was uttered during those hours, it would be impossible to reckon. One of his disciples came to see me a few days ago, clad in a blouse, and girded with a narrow leather strap. Inside that blouse, and next to his heart, he carried a volume of Tolstoi's which the writer had just given him. It might have been done partly because the blouse made a convenient pocket, but that this was not the whole reason was plain from the man's words and looks when he touched the book. He, as well as the rest, pronounced the name "Lyef Nikolaitch."

It does not strictly bear upon the subject under discussion, but I will add that, in the course of a conversation with this "adept" (as some call them here) of Count Tolstoi's, on that chief doctrine of Christ which Tolstoi has adopted as his stronghold—love to one's neighbor—I inquired what success he had in applying this doctrine indiscriminately. We can all exercise it with discrimination! He looked much disturbed, but replied frankly that, although he tried hard to love all men, not only as well as, but better than, himself, there were "a great many—yes, a *very* great many—extremely—well, *unpleasant* people in this world!" It is a painful subject, and, having reached that point of universal sympathy, I did not pursue it further.

I advise people to reject the dictionaries and title-pages, and to save the pronunciation of "Lyof" for occasions when they wish to speak of the animal represented thereby, viz., the lion. It is a small matter, no doubt, but if it is worth while to discuss it, it is worth while to be correct. ISABEL F. HAPGOOD.

ST. PETERSBURG, February 14-26, 1888.

GOETHE, WAGNER, AND THE INVISIBLE ORCHESTRA.

TO THE EDITOR OF THE NATION:

SIR: Among the great reforms which the modern opera stage owes to Richard Wagner's genius, not the least is that of an invisible orchestra, carried out for the first time at the performance of his 'Ring of the Nibelungs' at Bayreuth in 1876. Before Wagner, however, the immortal master of another art, Goethe, proposed the sinking of the orchestra—a fact overlooked even by Ferdinand von Hiller, the celebrated musician, who collected in his work, 'Goethes musikalisches Leben,' with great care, every written word of Goethe concerning music.

The passage, to be found in 'Wilhelm Meister's Apprenticeship,' is the following (I quote from Carlyle's translation):

"Music, particularly song, was a pleasure he could not live without; and it was one of his peculiarities, that he wished the singer not to be in view. 'In this respect, he would say, they spoil us at the theatre: the music there is, as it were, subservient to the eye; it accompanies movements, not emotions. In oratorios and concerts the form of the musician constantly disturbs us; true music is intended for the ear alone. A fine voice is the most universal thing that can be figured; and, while the narrow individual that uses it presents himself before the eye, he cannot fail to trouble the effect of that pure universality. The person whom I am to speak with, I must see; because it is a solitary man whose form and character give worth or worthlessness to what he says; but, on the other hand, whoever sings to me must be invisible; his form must not confuse me or corrupt my judgment. Here it is but one human organ speaking to another; it is not spirit speaking to spirit, not a thousand-fold world to the eye, not a heaven to the man.' On the same principles, in respect of instrumental music, he required that *the orchestra should as much as possible be hid;* because, by the mechanical exertions, by the mean and awkward gestures of the performers, our feelings are so much dispersed and perplexed. Accordingly, he always used to shut his eyes while hearing music; thereby to concentrate his whole being on the single, pure enjoyment of the ear."

EMIL BAKONYI.

WASHINGTON, D. C., February 20, 1888.

Notes.

THE fourth volume of the Comte de Paris's 'History of the Civil War in America' will be published about the middle of April by Porter & Coates, Philadelphia.

Macmillan & Co. will be the American agents of the new edition of Browning's works in sixteen volumes, with portrait and other illustrations to the number of at least one per volume.

A. C. McClurg & Co., Chicago, publish immediately 'William I. and the German Empire,' by G. Barnett Smith.

Renan's 'History of the People of Israel' is in the press of Roberts Bros., who also announce a 'Life of Dr. Anandibai Joshee,' the kinswoman and friend of Pundita Ramabai, by Mrs. Caroline H. Dall, who dedicates the profits arising from the sale of the work to the Ramabai "School Fund."

Houghton, Mifflin & Co. will soon publish the fifth part of Prof. Child's 'English and Scottish Ballads'; 'Irish Wonders,' peasant stories gathered at first hand by Prof. D. R. McAnally, and relating to ghosts, fairies, witches, etc.; 'Negro Myths from the Georgia Coast,' by Col. Charles C. Jones, jr.—a welcome supplement to "Uncle Remus"; and 'Metrical Translations and Poems'—the former from the German by Dr. F. H. Hedge and Mrs. A. L. Wister; the latter, Dr. Hedge's own verse.

A monograph on 'Chairs of Pedagogics in our Colleges and Universities,' by Prof. E. J. James of the University of Pennsylvania, is about to be issued by the Philadelphia Social Science Association.

B. Westermann & Co. send us their prospectus of a new edition of 'Stieler's Hand-Atlas of Modern Geography,' consisting of ninety-five colored plates (or five more than the edition of 1875), and to be distributed in thirty-two monthly parts, beginning in April. Among the wholly fresh maps will be Italy in four, the Balkan Peninsula in four, and Africa in six sheets. Two improvements are worthy of remark: single maps will be furnished at a moderate price to owners of former editions; and a complete index will be issued, though as a separate enterprise.

The Paris publishers, A. Colin & Cie., announce as in press three volumes of texts from French authors, annotated by writers whose names are well known beyond the circle to which school-books especially belong. These are the 'Théâtre choisi de Racine,' by M. Petit de Julleville; the 'Théâtre choisi de Corneille,' by M. Paul Desjardins; the 'Lettres choisies de Mme. de Sévigné,' by M. René Doumic. M. Petit de Julleville has written much of late years upon the history of the theatre in France; 'Les Mystères' and 'Les Comédiens en France au moyen âge' being of special interest. M. Paul Desjardins, who is not to be confounded with M. Albert Desjardins, the author of 'Les Sentiments moraux au XVIe siècle,' is the extremely clever young writer of the "Notes et Impressions" in the *Revue Bleue*. M. René Doumic, less well known than the other two, has recently published a volume which has been spoken of in the highest terms: 'Éléments d'histoire littéraire' (Paris: Delaplane; Boston: Schoenhof).

Mr. W. E. Henley, formerly editor of the *Magazine of Art*, and long a close student of the French Romantic period, is engaged on a life of Alexandre Dumas for the series of "Great Writers." There is now no good biography of Dumas in either French or English.

The Clarendon Press is publishing a Middle High-German "primer" prepared by Dr. Joseph Wright, Lecturer at Girton College, Oxford. The book, which is based upon Paul's Grammar, is intended to furnish the shortest possible introduction to the reading of the language, but the grammatical principles, though presented in summary, will be handled in the light of most recent investigations of historical grammar. An old High-German primer by the same author is also ready for press, and a Gothic primer is contemplated. Dr. Wright is a pupil of Osthoff and Brugmann, and the translator of Brugmann's 'Grundriss der vergleichenden Grammatik.'

Prof. Gustav Meyer of Graz (Styria), the author of the well-known Greek Grammar, has now ready for the press a short Albanian grammar, accompanied by extracts for reading and a vocabulary. Prof. Meyer's two volumes of 'Albanesische Studien' (Vienna, 1883 and 1884) proved to be of fundamental importance for all intelligent study of the language. They established definite tests for a discrimination of the native material of the language from the great masses of borrowed material, Turkish, Slavic, Greek, and Italian, which only the most exacting processes of scientific grammar availed to recognize. After this débris had once been effectually cleared away, it was possible to form an opinion concerning the real character of the original language, and Prof. Meyer's conclusion, that the Albanian is neither an offshoot of the Slavic nor of the Greek, but an independent branch of the Indo-European family, has received the almost universal concurrence of scholars. Students of folk-lore will also recall his translations of sundry Albanian legends, published with notes by Reinhold Köhler in vol. xii of the *Archiv für Literaturgeschichte* (1883), and an interesting article on the language and literature of the Albanians in volume xxiv of *Nord und Süd* (1883).

The 'Grundriss der germanischen Philologie' which is to be published by Trübner of Strassburg on the same general plan as Gröber's 'Grundriss der romanischen Philologie,' is to appear somewhat earlier than had been anticipated. The first part, containing contributions from Paul, Kluge, Sievers, and others, is already in press. The whole work is under the editorship of Prof. Paul.

Volume xli of the second section of Ersch and Gruber's 'Encyklopädie' finishes the letter K, for which a little more than nine volumes were required, and begins L. While the former letter abounded in Russian geography, Turkish literature, and Greek history and philosophy, the latter opens with many interesting names in French biography, among which are Laboulaye, Labourdonnais, Lacordaire, Paul Lacroix, Laffitte, Laguerronnière, La Harpe, Lamartine, Lamarck, Lamennais, La-

moricière, etc. It is curious that most of these chance to belong to the Second Empire, so that this volume possesses special value as bearing on the history and literature of a recent period, concerning which information is not readily accessible. In many of these articles Hillebrand's 'History of France from 1830 to 1870' is cited as a leading authority. The longest article in the volume is one of twenty pages on Karl Lachmann, one of the founders of modern German philology, eminent for his editions of ancient classics and of ancient German literature. From internal evidence he arrived at the conclusion that the 'Iliad' consisted of eighteen separate poems by several authors, thus deducing from different premises the Homeric theory put forth at an earlier date by F. A. Wolf. The article next in length is one of fourteen pages on map-drawing, treated technically, with several pages of tables for the proper construction of a map according to latitude and longitude.

'What American Authors Think about International Copyright' is the title of a neat pamphlet issued by the Copyright League, and to be had on application to Mr. R. V. Johnson, Treasurer, 33 East Seventeenth Street, or Mr. G. W. Green, Secretary, 11 Pine Street. It has facsimiles of Mr. Lowell's autograph and of Longfellow's. In the mass of opinions of the leading living American authors here collected almost every point of view is taken, and every side of the question debated.

Dr. James C. Welling, President of Columbian University, has reprinted from the first number of the *American Anthropologist* his paper on the Law of Malthus. It is, in legal language, of the nature of a plea in confession and avoidance. The tendency described by Malthus is admitted, but the counteracting tendencies are dwelt upon, especially the capacity in man as a rational animal to control the conditions of his development. The paper is free from polemical bias, and gives a philosophical view of the subject.

A daughter of the late Norman Macleod, D.D., has compiled a volume from his writings and unpublished manuscripts, entitled 'Love the Fulfilling of the Law' (A. D. F. Randolph & Co.). It is made up of broken echoes of his literary activity—fragments of sermons, bits of description of persons and countries, parts of stories for children. The whole will doubtless be of value to his friends as a souvenir, though it will add little if anything of distinctive worth to what he gave to the world in his lifetime.

Mrs. Frances Hodgson Burnett gives children another rare treat in 'Sara Crewe; or, What Happened at Miss Minchin's,' reprinted from the pages of *St. Nicholas* (Scribners). This story is worthy of the captivating pen of the authoress of 'Little Lord Fauntleroy,' but within narrower limits. Sara is a precocious little maiden, with a most lively imagination, stimulated into wonderful activity by the hardships and privations which fall to her lot as drudge in a boarding-school. Her only pleasures come from books and from her various "pretends." The delightful and fairy-like surprise that presently brightens her life proves to be not a dream, but the beginning of a complete change of fortune.

'St. George and the Dragon: A Story of Boy Life,' by Margaret Sidney (D. Lothrop Co.), is the title of one of the tales in a book bearing that name. It is an interesting story, and portrays a very manly American boy, called St. George by his companions on account of his chivalric disposition. Half of the volume, however, is filled by another narrative, called "Kensington Junior," which is poor and improbable.

M. Daudet's 'Trente Ans de Paris' (New York: F. W. Christern) has already been reviewed at length by our Paris correspondent, and we recur to it now only to note the author's rather curious economy of material. It contains sixteen chapters. Five of these, under the general head, "Histoire de mes Livres," are accounts of the genesis of 'Le Petit Chose,' 'Tartarin de Tarascon,' 'Lettres de mon Moulin,' 'Jack,' and 'Froment Jeune et Risler Aîné'—all of which, written originally for the *Nouvelle Revue*, have also appeared as prefaces of the stories in the library edition of M. Daudet's works issued jointly by Dentu and Charpentier. Oddly enough, three other of these prefaces, including that of 'Le Nabab,' already printed in the *Nouvelle Revue*, are not to be found in 'Trente Ans de Paris.' The paper on Turgeneff is that written for the *Century*—with a single added paragraph; but the other *Century* paper, on Mistral, we seek here in vain. Another chapter, "Premier Habit," was published only a few months ago in the volume with 'La Belle Nivernaise.' An advertisement at the head of 'Trente Ans' informs us that the first volume of M. Daudet's writing which was published with frequent and ingenious illustration, 'Tartarin sur les Alpes,' has now attained a sale of 120,000 copies.

Calmann Lévy has issued another volume of the interesting and valuable "Souvenirs Diplomatiques" of M. G. Rothan, 'La Prusse et son Roi pendant la Guerre de Crimée,' which first appeared in the *Revue des Deux Mondes* in November, December, and January last. Like the preceding volumes of the series which the "ancien ministre plénipotentiaire" of Napoleon III. has been giving to the world for some years past, the present work is one which no one interested in the history of Europe since the middle of the present century can afford to pass by, and which will well repay the less serious reader in literary interest and pleasure, whatever his political sentiments and sympathies may be.

The long-expected tome viii of the 'Chroniques de Froissart,' edited for the Société de l'Histoire de France by M. Siméon Luce, has been issued in two volumes by the publishing house of Renouard. The first volume of this work appeared in 1869, but since 1878 nothing has been published until now.

'Shakespeare et les Tragiques grecs,' the third and concluding volume of M. Paul Stapfer's "Shakespeare et l'Antiquité," has just been republished in an 18mo edition by Lecène & Oudin (Boston: Schoenhof). The other volumes, 'Les Tragédies romaines de Shakespeare' and 'Drames et Poèmes antiques de Shakespeare,' have already been published in the same form by Fischbacher, who issued the original 8vo edition now out of print.

It may aid the reviewer who has to pass on the work entitled 'The History of Portugal,' by Edward McMurdo, lately published by Sampson Low, London, to know that it is a mere translation of Herculano's 'Historia de Portugal.' The title-page vouchsafes the information that Mr. McMurdo has "compiled from Portuguese histories." The author in the preface helps us a little further by the statement: "I had learnt so much of the glorious past of Portugal that I resolved to have a translation made of records available at Lisbon. The Portuguese language is most difficult, and it was only after two years' search that I found a competent translator in the person of the accomplished Miss Mariana Monteiro, to *whom all the credit* of the present volume is due." Herculano is not mentioned. Examination shows the present volume, which covers the history from 1097 to 1279, to be a very literal translation of the first seven books of Herculano. In all this, Mr. McMurdo's share in the production of this first English history of Portugal seems to be reduced to that of publisher. Herculano died in 1877, and his history does not extend much beyond the limit of the English version, so that if Mr. McMurdo intends to bring the history down to modern times, he will have to depend on some other authority, to whom it is to be hoped he will give credit.

The February number of *Petermann's Mitteilungen* contains accounts by Baron Eggers of his journey into the interior of St. Domingo, and by H. Wichmann of explorations in Jana-Land and the New-Siberian Islands. The article of greatest general interest, however, is by Dr. R. v. Lendenfeld, "On the Influence of Deforesting upon the Rainfall of Australia.' Though his observations have not been numerous enough nor sufficiently extensive to prove as yet of much scientific value, they have led him to believe confidently that Europe and Australia are affected in precisely opposite ways by the clearing of forest lands. One-quarter of the rainfall of central Europe he holds to be due to her forests—that is, the annual amount would diminish to that extent if the land was left entirely barren. Australia, on the other hand, is a dry country, and the trees and plants adapt themselves to this condition. Their roots penetrate very deep into the soil, and spread to a great extent to gather all the moisture possible. Of this they give out almost nothing by evaporation; the eucalyptus, for instance, closing its pores in the heat, and keeping constantly the edges of its leaves to the sun. No grasses grow under the trees in an Australian forest, as these absorb all the moisture, and consequently the ground is as hard as a rock, the rain from the infrequent showers running off as rapidly as from absolutely barren ground. The struggle between plants and grasses here is not, as in Europe, a struggle for light, but for water, and the two cannot exist together. But when the trees are cut down, the grasses spring up and flourish, and when they die, their stems and roots remain, making little ducts through which the water percolates into the ground, and so greatly increasing the subterranean stores of water. In New South Wales, tracts which, before the trees were cut down, would barely feed a hundred sheep, now support a thousand.

In the February *Bulletin* of the Société de l'histoire du Protestantisme Français, M Ch. Read completes his examination of Mme. de Maintenon's alleged complicity with the Revocation of the Edict of Nantes, in which he unequivocally acquits her of the charge. It also contains an interesting letter of the widow of M. Rapin, the historian, to Paul Mascarene, found in the Library of Harvard University, in which she gives some account of her husband and family.

The well-edited, agreeably printed, and always entertaining *Revue des Traditions Populaires* has been enlarged in size and in scope, and typographically embellished, with the volume for the new year. This puts the cost a little beyond the means of the Société des Traditions Populaires, which publishes the *Revue*, and an appeal for voluntary aid has been made to members. An enlarged subscription list abroad would doubtless also be welcome. The annual price is 17 francs. The treasurer is M. A. Certeux, 167 rue St.-Jacques, Paris.

The editor of *De Portefeuille* offers to artists everywhere a prize for a design for a pictorial cover to its winter issue for 1888, to be drawn in line or in water-color, for reproduction by zincography or chromotype. The best design will receive $120, the second $60, the third $40.

A copy of the paper (an illustrated literary and art journal published at Amsterdam, Rokin 70) will be sent on application by those wishing to compete. The designs must reach M. Taco H. de Beer, P. C. Hooftstraat 83, Amsterdam, by May 15.

—Among the great private libraries of England none perhaps is more widely known than the Middlehill library, collected by the late Sir Thomas Phillipps, it being especially noted throughout Europe for its wonderful collection of manuscripts, over 3,000 of which were described by Haenel in his 'Catalogi Librorum Manuscriptorum,' so long ago as 1830. At the death of Sir Thomas, in 1872, the number of manuscripts had increased to 60,000, and, as the owner was a trustee of the British Museum, many indulged in the hope that this remarkable collection, which had been transferred from Middlehill to Thirlestane House, Cheltenham, might find a permanent and fitting resting-place in the great national library. But, by a will made a few days before his death, Sir Thomas bequeathed Thirlestane House, together with the famous library which, it is said, literally filled the great mansion, to his youngest daughter, Mrs. Fenwick, for life, with remainders over to her heirs, coupled with the strange condition that neither his eldest daughter nor her husband (the noted Shakspere scholar, J. O. Halliwell-Phillipps), nor any Roman Catholic should ever be permitted to enter the house. It was also understood that, by the will, the collection was so strictly tied up that there was little likelihood of its passing out of the family. In August, 1886, however, it was advertised that the first portion of the Middlehill library would be sold at auction in London. This first portion contained 3,346 lots, and realized only about £2,200, but it seems it consisted chiefly of duplicates, imperfect copies, and working books, and included none of the manuscripts the collection of which still remained intact. In a note by Dr. De Vries of Leyden, in the February number of the *Centralblatt für Bibliothekswesen*, it is stated that, in consequence of recent changes in the English law of entail, the heirs of Sir Thomas Phillipps have succeeded in obtaining the permission of the Court of Chancery to sell the library, and that the German Government has taken advantage of this opportunity to secure the famous Meerman collection, which was sold at the death of Johann Meerman in 1824, and passed almost entire into the possession of Sir Thomas. De Vries also says that the Dutch Government has just succeeded in purchasing everything relating to Dutch history and literature (outside of the Meerman collection) remaining in the Middlehill library, comprising 161 numbers and 88 boxes of documents. Among the most important of these manuscripts are two unpublished works by Huygens, several chronicles, and a Middle-Dutch 'Spiegel Historiael,' by Jacob van Maerlant, much older and fuller than the only manuscript hitherto known of the first part. The documents relate chiefly to the history of Utrecht, and are said to be extremely valuable. They number about 3,000, and are nearly all older than the seventeenth century. According to the editor of the *Centralblatt*, the statement that the German Government has purchased the Meerman collection is not strictly correct, the fact being that the collection has been purchased by a few public-spirited citizens of Berlin, who on former occasions have shown an unselfish interest for learning, with the intention of offering it to the Royal Library at a moderate price. The Meerman collection contains many Greek manuscripts, but its chief value is said to be in the Latin manuscripts, among them being many of great importance for the history of Germany, and the late G. Waitz had long ago urged the desirability of purchasing the collection if ever the opportunity offered.

—Mr. Halliwell-Phillipps, observing our note on Shaksperiana and taxes on culture, calls it "an able and decisive article on the wrong inflicted by the book-duty." "All the books," he writes, "I am printing now and for the last sixteen years, excepting only my 'Outlines,' have been for presents only among friends and students, not a single copy being sold. It is perfectly monstrous that I cannot distribute such books among my numerous American friends without subjecting the latter to payments that are practically fines, and, if you will excuse a pun, payments which it is not morally their *duty* to discharge." Mr. Phillipps, though he says a succession of small illnesses has kept him for many weeks out of his study, has still with irrepressible productivity just written a 'Dictionary of Misprints.' This is, as he describes it, "a novel attempt to turn what has hitherto been thought slag into good use" He has printed this work in small quarto, "exclusively for presents only, not a single copy being sold." In a note saying that he has mailed us a presentation copy, he says: "I shall be anxious to know if duty is charged." In our paragraph concerning the book-tariff we had complained of being forced to pay a tax on a Bible we had imported—the Oxford Tetrapla New Testament—an edition that had never been reproduced in this country and never will be. In the reform tariff bill now before Congress all Bibles are placed on the free-list. If "books printed exclusively for presents" were placed on the same list, would protection suffer even in the ninth part of a hair?

—Parts i-iv of the Appendix to the Eleventh Report of the Historical Manuscripts Commission have recently appeared. Part i consists of "The Manuscripts of Henry Duncan Skrine, Esq.—Salvetti Correspondence"; Part ii, "The Manuscripts of the House of Lords, 1678-1688"; Part iii, "The Manuscripts of the Corporations of Southampton and King's Lynn." The originals of the letters comprising the Salvetti correspondence are preserved in the archives of Florence. They were written by Alessandro Antelminelli of Lucca, who assumed the name of Amerigo Salvetti, and was for many years the representative of the Grand Dukes of Tuscany at the English court. The volume before us contains his despatches during the years 1625-1628, and is based upon a translation made by Mr. Heath Wilson in 1881, now in the possession of Mr. Skrine. These letters contain the views of an intelligent observer of English affairs, and throw much light on the history of the period that they cover. The papers in Part ii elucidate many interesting events of the reigns of Charles the Second and James the Second, but they are particularly valuable for the study of the history of the Popish Plot and the Habeas-Corpus Act. The passing of the latter, according to Burnet, was due to an artifice, one of the tellers having counted a "very fat lord" as ten. "Incredible as this story appears, the Minute Book, strangely enough, contains fewer Peers present than are represented on the division" (p. viii). Mr. J. C. Jeaffreson is the compiler of Part iii. In this, as in most of his reports on the archives of English towns, he betrays an inadequate knowledge of the details of English municipal history, and hence often fails to emphasize duly what is of importance. For example, if he were a profounder student of the subject, he would have more strongly accentuated the conspicuous position of the Holy Trinity Gild in the community of King's Lynn, together with its peculiar relations to the governing body, and would have given us fuller and more judicious extracts from the Gild rolls. His "discoveries," which he always conspicuously labels as such, are often unimportant or untenable. For example, on page 211 he states that women were admitted only to the *spiritual* benefits of the Gild. "What is here said . . . should not escape the reader's attention, nor be allowed to pass from his mind, as it differs materially from what was written on the same subject by the late Mr. Harrod." But what he advances does not show that the latter was necessarily wrong. At all events, in most of the towns of England women were admitted to *all* the benefits of the gilds, and hence the reader would do well to allow Mr. Jeaffreson's statement "to pass from his mind." Mr. Jeaffreson ought to post himself more fully on the literature relating to the history of a town before he attempts to print extracts from its archives. On page 8 he exhorts Hampshire archæologists to print "The Oak Book" of Southampton, evidently not being aware that the greater portion of it was edited by Smirke in vol. xvi of the *Archæological Journal*. Moreover, here, as in his other reports, the compiler transcribes his documents very indifferently. On page 8, for example, he has "aler nyer devaunt ly" for "a servyer devaunt ly," to serve before him; "tauntoi," "tantu'," for "taunt cum," "tan cum," as long as; "mizt," "muytz," for "nuzt," "nuiytz," night; "vn galoundde vyn de vne chaundele," for "vn galoun de vyn et vne chaundele," one gallon of wine and one candle. But the shortcomings of the compiler, however grave they may be, only slightly diminish the real value of the volume before us, which is very great. It may now be said without hesitation that the reports of the Historical Manuscripts Commission constitute the most important source for the study of English municipal history. The only other source that will rival it in value is the Report of the Municipal Corporations Commission of 1835.

—Part iv gives an account of the manuscripts of the Marquis Townshend, which, in addition to a valuable collection of Jacobite papers, contain many documents of great interest for American students. Such are the numerous papers relating to the affairs of the American colonies in the first half of the eighteenth century. Most of the letters in this portion of the collection were addressed to Lord Wilmington, President of the Council from 1731 to 1743. Among the letters from the Governors of the Carolinas is one from Gabriel Johnston, giving a very unflattering account of the colonists of that province. He says it is

"an easy task to describe the genius and temper of the inhabitants; it is only to imagine the lowest scum and rabble of Change Alley transplanted into a rich and fruitful country, where with very small labor they can build themselves sorry hutts, and live in a beastly sort of plenty and all the rest of their time devoted to calumny, lying, and the vilest tricking and cheating; a people into whose heads no human means can beat the notion of a public interest, or persuade to live like men, or even to pursue the most commendable and surest method of acquiring riches. . . . Among them a cheat of the first magnitude is treated with all the distinction and regard which is usually paid to men of merit, and conspicuous virtue in other parts of the world. This is truly, and without any exaggeration, the real character of the generality of the people here. There are indeed a few, and but a very few, men of integrity and candor, by whose assistance I hope we shall be able to people the uninhabited parts of the province with a better race of men. Before my arrival there was no

such thing as recovering private debts, but for paying the King his rents, it never once entered into their thoughts."

A letter from Gov. Oglethorpe of Georgia reports very fully two interviews with the chiefs of the Chickasaw Indians at Savannah in 1736. The great fire at Charleston in November, 1740, calls forth a petition to the King, from the Legislature of the colony, in behalf of the distressed inhabitants.

—The Massachusetts papers include many letters from Gov. Belcher, describing the difficulties of his position. On November 13, 1740, he writes to his brother-in-law, Richard Partridge, who had been looking after his interests at court, "I understand, since the arrival of the last ships my Enemies have a great dependance upon a revival of the censure past on me last year in the Privy Councill. I know they would move heaven and hell if it were in their power, to get me out at the King's return, but considering the vast interest you have made for me, I hope they will be finally defeated and disappointed—I know I shall stand in need of all the strength you can make, so, pray, brother, be still alive and on the sharp look out." His hopes, however, were not fulfilled, for in May, 1741, he was superseded by Shirley. Full of interest, too, are the papers relating to the siege of Quebec. The opinions of two of Wolfe's subordinates as to his generalship are perhaps worth quoting. Brig.-Gen. Townshend, who succeeded to the command at the death of Wolfe, says in a letter to his wife, written from Camp Levi on September 6, 1759, "Gen. Wolfe's health is but very bad. His generalship in my poor opinion—is not a bit better, this only between us. He never consulted any of us till the latter end of August, so that we have nothing to answer for I hope as to the success of this Campaign." And Brig.-Gen. Murray, in a letter to Townshend dated October 5, 1759, says, "I have no copy of the paper I sent by you to Gen'l Wolfe concerning his scheme of landing between Point au Tremble and St. Augustin, but the publick orders are a sufficient proof of his intention to do it, and likewise of the suddenness of the thought of landing when we did. Indeed his orders throughout the campaign show little stability, stratagem, or fixt resolution; I wish his friends had not been so much our enemys, his Memory would probably have been dearer to his country than now it can be. We are acting on the defensive, you have the execution of the plan, and I am well persuaded you will manage it with as much tenderness to the memory of the poor General as the nature of things will admit of." The letter of Gen. Townshend to William Pitt, describing the attack and capture of Quebec, is printed in full, as is also another account of the operations from a series of Rough Notes of the movements of the forces from July 28 to September 13.

—Interesting in a different way is the correspondence between the third Lord Townshend and Dean Tucker, discussing theories of commerce, the corn bounties, taxation, etc., while the correspondence between this same Lord Townshend and the authorities of Cambridge University concerning the prizes offered by his Lordship, for the two best essays "upon subjects included within the Theory of Trade," will be found rather amusing reading. It closes with the following letter from his Lordship to Dr. Law:

"Sir: I received your letter of the 24th inst this morning and shall in answer only mention in a few words that when you, the Vice-Chancellor of Cambridge, did in your letter of the 28th of Jany last seem to charge me with inconsistency of conduct, and did mention in that letter, that the first question relating to the influence of Trade on morals might as you apprehend be postponed on account of the great corruption for some time visible among the trading ports of our nation; witness the late uproar raised about the general naturalization and Jew Bills, I did resolve to let the Institution drop so far as I have been concerned in it, and to give my self no further trouble about it, you need not therefore give yourself the trouble of transmitting to me the two Prize Dissertations. There is not any moral duty which is not of a commercial nature. Freedom of Trade is nothing more than a freedom to be moral agents. And since a free moral inquiry into this most interesting theory on the observance of which the happiness of this life and of the next do entirely depend, cannot be allowed at your University, I have done, and have nothing more to add than that I am, sir, your obedient humble servant."

—The February number of *Les Lettres et les Arts* (Chas. Scribner's Sons), though it contains only five articles, is as varied in its contents as this review generally is, for both M. Jules Simon and M. Guy de Maupassant have presented their subjects under so many aspects that an impression of variety and abundance is made by the whole. In "Un Normalien en 1833," M. Jules Simon returns to the days of his youth, to the *collège* at Vannes in Brittany and the École Normale in Paris. It is not an account of his student life that he gives, but rather a vivid picture of the great school which has sent into the world so many men of note in the present century, and of its famous teachers at the time—Cousin, Damiron, Garnier, for philosophy, Nisard for literature, Michelet for history. All these, and others less famous, are presented with striking vividness and reality. Even the Abbé Lacordaire and his lectures at the Collège Stanislas, which drew young men from all the schools of Paris to listen to him, are pictured in a few striking pages. But the chief figure is that of the writer's friend and companion, a Breton like himself, whom he calls Jean Le Bris, who, like Renan and Ferdinand Fabre, began in the *séminaire* of his province an ecclesiastical training which growing doubts finally cut short. The writer warns his readers in the beginning that perhaps Jean Le Bris was not at the École Normale, that he was perhaps not at the *séminaire* at Vannes, nor afterwards a member of the Institut. But he adds that, aside from these small details, all that he relates is scrupulously true. Jean Le Bris seems to represent the conscientious change from a state of faith to one of doubt, and, finally, unwilling rejection of early religious beliefs in the generation to which he belonged. But M. Jules Simon has made a striking reality of his moral and historical and artistic conception, and he has clothed it in the inimitable simplicity of that style which makes of him one of the most attractive of writers. In another way M. de Maupassant's "Sur l'eau" is as wonderful a piece of work. He tells us it is part of a journal kept during a cruise along the shore of the Mediterranean in his yacht, the *Bel-Ami*, in which he amused himself by writing what he saw and what he thought. What an artist and a thinker like M. de Maupassant sees and thinks and relates is something to charm any reader. This journal of three April days and nights is one of the most varied and finished of M. de Maupassant's always delightful impressions of travel, in which his best qualities are revealed.

—Mention was made in Number 1184 of the *Nation* of the discovery of the site of ancient Icaria in excavations conducted by the American School of Classical Studies at Athens, and we print this week a long letter on the same subject. The determination of the site was important in itself, but the continued excavations have been unexpectedly productive of interesting results. Among the objects which have been brought to light is a colossal head (ten inches across the face) of the bearded Bacchus, admirably executed, and believed to belong to the sixth century B. C. The front hair is made up into huge "spit curls" (each being an inch and a half across), all around the forehead, and down to the ears. The eyes are of the archaic, almond type, and the beard and moustache are curled with all the elaborateness of an Assyrian statue, yet this is distinctively not Assyrian. The beard resembles that of the Cypriote figures, yet it has a character of its own. One long slab, which had served (fortunately face downwards) as the doorsill of a Byzantine church, bears a complete duplicate (except the face) of the celebrated "Warrior of Marathon." Among other works of art are a torso of a young satyr, and another of a colossal statue of a male draped figure. Two slabs are covered on each face with reliefs of processions or sacrifices. Two inscriptions of the fifth century B. C. have been found, of the highest interest for the rural worship of Dionysus. Work has been interrupted somewhat by unfavorable weather; and as yet, when each day brings new discoveries which supplement those of the previous days, no careful study of the treasure-trove has been possible. These discoveries seem to us to be extraordinarily important, and we trust that they will excite sufficient interest to help in securing a permanent endowment for the School at Athens.

BRACTON'S NOTE BOOK.

Bracton's Note Book: A collection of cases decided in the King's Courts during the Reign of Henry III., annotated by a lawyer of that time, seemingly by Henry of Bratton. Edited by F. W. Maitland of Lincoln's Inn, Barrister at Law, Reader of the English Law in the University of Cambridge. London: C. J. Clay & Sons, Cambridge University Press Warehouse. 1887. Three volumes, octavo, pp. 337, 720, 723.

THIS is a book of extraordinary interest and value; and the importance of its contents is well supported by the thorough and admirable manner in which it is edited. It presents us with authentic copies from the judicial records, hitherto unpublished, of cases in the King's courts of the time of Henry III., covering nearly the first twenty-four years of his reign, say, 1217-1240. Not merely that; it is a selection of the more important cases, and made by a contemporary writer; and there is very strong reason indeed to believe that it was made by Bracton himself.

Bracton was one of the principal judges of the time, and the author of a great legal treatise of which, comparing it with Blackstone, Mr. Maitland well remarks: "Twice in the history of England has an Englishman had the motive, the courage, the power to write a great readable, reasonable book about English law as a whole." It has been the fashion, at one time and another, to slight Bracton on account of his use of matter derived from what has been called the legal *plenum* of that period, the Roman law. Fitzherbert, in his 'Abridgment' (*Garde*, 71), has preserved a remark of the Judges in the generation just preceding his own, to the effect that Bracton was never regarded as an authority in English law—"et tout le court dit que Bracton ne fuit unques tenus pur auctor en nostre ley." This was repeated by a chief justice in the next century (Plowden, 358); and in the last century we hear

it more than once, not only in England, but on the Continent. But, whoever says it, we know it now for a shallow and ignorant remark; we know that the sober Reeves was much nearer right when, in composing his 'History of the English Law,' he praised Bracton so highly and adopted him "as the basis of all legal learning." Now there is good and probably sufficient reason to believe that we have here a note book of cases, prepared under his own supervision, which Bracton used in the preparation of his great work; and we may now have the novel and really startling satisfaction of testing and weighing Bracton's statements of the law by comparing them with the cases upon the authority of which he made them. It is many a year since any contribution has been made to the study of the history and foundations of the English law which is at all comparable to this.

The manuscript of the 'Note Book' was discovered in the British Museum in 1884—or rather the true character of the manuscript was first suspected then—by Professor Vinogradoff of Moscow. We owe the publication of it now to the devotion and generosity of Mr. Maitland. He speaks in the most modest way of his excellent editorial labors:

"Before I am blamed for having done less than might have been done in the way of collating rolls, giving various readings, making indexes and notes, it will, I hope, be remembered that this has been a private enterprise. I have often had to count the cost; also to reflect that another day in the Record Offices or the British Museum would mean another hundred miles in the train. . . . As there was no learned society whose business it was to encourage the study of English legal history (for the Selden Society was not yet born nor even thought of), it seemed likely that the 'Note Book' would remain unprinted for many years unless some one would make such an edition of it as could be made at his own cost and without giving to it all his time. Perhaps I was not the man for the work; but I have liked it well."

The cases themselves, of which there are 1,982, are in the Latin of the original rolls, and fill two stout octavo volumes. Then there is another thinner first volume, containing a short preface, an account of the discovery of the manuscript by Professor Vinogradoff, a full and excellent introduction by Mr. Maitland, and, finally, a careful apparatus of tables and indexes. For many people the index of persons and of places will have much interest, exhibiting as it does familiar names of the present day upon the judicial rolls of six or seven centuries ago.

The discovery of the real nature and value of this manuscript so recently, and by a Russian, is a striking reminder of the relative backwardness of English scholars in a knowledge of the history of their own law. Vinogradoff, Professor of History at Moscow, while investigating the sources of mediæval history in England in 1884, in the course of examining Bracton and his authorities, was referred to this manuscript. A careful reading of it and comparison with Bracton's text led him to the belief that "it was drawn up for Bracton and annotated by him or under his direction." He published a letter in the *Athenæum* for July 19, 1884, giving strong reasons for this opinion; and the matter was then taken up by English scholars. England owes Mr. Maitland much for having come forward at once and assumed the great labor and expense of this publication. And it will do well if it heeds his humorous warning, in calling for a new edition of Bracton's treatise—so lately edited, in a very discreditable manner, at the public expense; "Bracton's treatise ought to be carefully and lovingly edited. If this be not done by an Englishman, it will be done by a foreigner—as it is written, Vocabo super eos gentem robustam et longinquam et ignotam cuius linguam ignorabunt"; and for this passage he duly cites his authority, Bracton, folio 34. "Carefully and lovingly edited"—the phrase is a peculiar one; but it intimates well the character of the writer's own patient, scholarly, thorough, admirable work in editing the 'Note Book.'

Passing over the first sixty pages of his Introduction, which relate to Bracton's treatise, and to matters illustrating his personal history, and which are full of instruction, we come to what takes up the larger part of the remaining eighty pages—an excellent account of the 'Note Book' and of its relation to the great treatise. The manuscript was bought by the British Museum from the library of a Mr. John Holmes of East Rexford. A few pages are missing at and near the beginning, and an unknown amount is wanting at the end. Some memoranda upon it in a hand of the fifteenth century indicate that it was in about its present shape then. It has marginal notes in a hand of the thirteenth century which appear to have been made by the person for whom the cases were copied. In comparing the 'Note Book' with the original rolls, Mr. Maitland discovered that many of the rolls here copied are not now extant; but where they do exist he found a circumstance which we must let him tell in his own words:

"When, having copied some pages of the 'Note Book,' I took my transcript to the Record Office, in the hope of finding the original records, I expected that the work of hunting for my cases would be tedious. To my surprise and delight, on taking up the first roll, I discovered that the work had been done for me. Every case that I wanted had against it a mark of an obvious, unmistakable kind. In the margin of the roll, down the whole length of the case, some one had drawn a firm, heavy line, in color a dark rusty brown; to look at, it was much such a line as might have been drawn by the old-fashioned red-lead pencil. I soon learned to know that this 'scoring,' as I call it, was the work of the man who had the Note Book made for him. Whenever there was a scored roll, the cases in the Note Book agreed perfectly with the cases on that roll, saving the immaterial omissions, of which hereafter, and saving mere clerical blunders. . . . In some instances the copyist has apparently obeyed what he took to be his instructions, with a slavish obedience; he has left out the important end of a case, because the mark on the roll did not go far enough, or has copied just the first lines of the next case, because the mark went a little too far."

Mr. Maitland's argument (pp. 72–117) for thinking the 'Note Book' to be Bracton's is singularly temperate; at the same time, it is strong, and such as will bring many a reader to join with him in the "revocable judgment" which, after the formula of the rolls, he enters up at the end of the discussion: "Et ideo consideratum est quod Henricus recuperavit seisinam suam, saluo iure cuiuslibet." We will state the outline of the argument, but much of its force depends on circumstances for which we have not room.

Bracton's treatise cites nearly five hundred cases, of which two hundred are found in the 'Note Book.' All are from three classes of Rolls: (1.) Of the bench at Westminster; (2.) Of pleas which followed the King; (3.) Eyre Rolls. Both the treatise and the 'Note Book' begin and end their collections from the rolls of the first class at the same point. Both begin taking cases from the rolls of the second class at the same point, and, as regards these, all the cases in both are from the same six consecutive rolls. Of the Eyre Rolls the treatise cites twenty, and the 'Note Book' only eight; but all, in both, are rolls of the same two famous judges, Pateshull and Raleigh; and inasmuch as the cases from the Eyre Rolls come last in the 'Note Book,' and the end of this is lost, a reason is given for the absence from it now of other cases of this class.

Again, there is a close and curious resemblance between the side-notes and other annotations of the 'Note Book' and the text of the treatise. The nature of the annotations, as being made by the one for whom the work was done, their references and omissions to refer to legislation, and their citations of other cases, indicate pretty plainly their date as about that of the compilation of the 'Note Book' itself, viz., about 1240–1256; and with this the handwriting agrees. Curious phrases, the same context of words, the same peculiar opinions, and the same errors appear in both. As regards certain not perfectly verifiable cases briefly cited in these annotations, *e. g.*, thus: *fere casus Cole*, *casus Corbyn*, *casus Radulphi de Arundelle*, etc.—Mr. Maitland examines them all. Some of them occur in a like form in an important manuscript of the treatise; others appear to be cases tried before Bracton himself, or such as related to neighbors or friends of his, or are in some probable way connected with Bracton.

The last of Mr. Maitland's arguments points out that the 'Note Book' and the treatise are both "guilty of the same astonishing blunder." The statute of Merton, chapter ix, as is well known, preserves, as of the date of January 23, 1235–36, the fact that the Bishops declared that they could not and would not answer certain questions relating to bastardy which were at that period put to them, and that they asked the Lords to consent to a change in the law, so that children born before the marriage of their parents should be legitimated by the after marriage. And then came the famous answer: "Et omnes comites et barones una voce responderunt quod nolunt leges Anglie mutare que usitate sunt et approbate." A hundred years later (11 Ass., 20) Chief-Justice Scrope said, in explanation of this "statute," that previously, if it was alleged that a man was a bastard, it was usual to send to the Bishop to certify in this form, viz., whether he was born before marriage or after, and upon the answer the common-law courts gave judgment according to the law of the land. The operation of this was to keep the question of law in the hands of the common-law judges instead of leaving it with the clergy. There had been in October, 1234, an ordinance requiring this to be done; and the statute of Merton shows that the Bishops refused to obey it. Now, it is a singular fact that Bracton transposes the order of these two provisions; he makes the ordinance of 1234 follow the statute of Merton, as of October, 1236, and as having been called out by the refusal recorded in the "statute." This error in Bracton was pointed out by Selden. Now, the 'Note Book' does the same thing, with a variation; it makes the ordinance follow the statute of Merton, only it carries both back to the year 1234. As regards these enactments there are also other remarkable resemblances between the treatise and the 'Note Book,' in points where both differ from the statutes; and these are brought out very clearly by Mr. Maitland by the use of parallel citations.

Such, in a very imperfect summary, are the arguments. While "the value of this book," as the editor justly says, "does not depend wholly or even chiefly" on the success of the argument that it is Bracton's own 'Note Book,' he reasonably considers the case to be made out, and sums up thus:

"The treatise is absolutely unique; the 'Note Book,' so far as we know, is unique; these two unique books seem to have been put together within a very few years of each other,

while yet the statute of Merton was *noua gracia;* Bracton's choice of authorities is peculiar, distinctive; the compiler of the 'Note Book' made a very similar choice; he had, for instance, just six consecutive rolls of pleas *coram rege;* Bracton had just the same six; two-fifths of Bracton's five hundred cases are in this book; every tenth case in this book is cited by Bracton; some of Bracton's most out-of-the-way arguments are found in the margin of this book, in particular that about the binding of land by warranty, that about the ejectment of a disseisor; the same phrases appear in the same contexts, *Juste propter jus sed iniuste propter iniuriam, Nihil certius morte, nihil incertius hora mortis;* Corbyn's case, Ralph Arundell's case are 'noted up' in the 'Note Book'; they are 'noted up' also in the Digby MS. of the treatise; with hardly an exception all the cases thus 'noted up' seem plainly to belong to Bracton's country, to affect persons whom Bracton must have known, Raleighs, Traceys, Gorges, Blanchminsters, Winscots, Arundells, Punchardons; lastly, we find a strangely intimate agreement in error. The history of the ordinance about special bastardy and the *Nolumus* of Merton is confused and perverted in the same way in the two books."

As regards one of the Latin phrases quoted in this passage—when Bracton says, "licet nihil certius sit morte, nihil tamen incertius est hora mortis," and the annotator says, "nihil certius morte, nihil incertius hora mortis," the suspicion arises that both may be using some familiar quotation or commonplace; and Mr. Maitland does not overlook this.

> "Mors incertarum rerum certissima cunctis,
> Incertum quando, certum aliquando mori";

so run certain seemingly monkish lines of unknown origin, in a little 'Flores Poetarum' published at Cologne in 1712. And Chaucer, as a friend reminds us, said, in the 'Clerk's Tale,' in the next century after Bracton's:

> "And al so certein as we knowe echoon
> That we shal deye as uncerteyn we alle
> Been of that day when death shal on us falle."

Perhaps the "nihil certius morte" will hardly be found in any classical author. And yet Bracton does quote Horace. In his "Est enim modus et mensura et fines certi, ultra quæ citra quæ nequit consistere rectum" (fol. 229 b), one detects the passage from Sat. i, 106, 107:

> "Est modus in rebus, sunt certi denique fines,
> Quos ultra citraque nequit consistere rectum."

Fleta (Lib. iv, c.; 23, s. 4), which seems to belong to the date of 1285, or thereabout, repeats this (as we might expect) in Bracton's form, but with the slight variation of "ultra quæ et citra." And then, oddly enough, in the 'Placitorum Abbreviatio' (226, col. 2), we may read it actually incorporated in the records of the King's Courts in precisely Bracton's form (saving only an evident slight misprint), at the end of a long judgment of 1291 in an Irish appeal on a writ of right. Among a variety of defects it was adjudged that the form in which the parties had put themselves upon the grand assize was wrong. Form, the judgment says, is necessary here, and consent of the parties will not cure the fault [etc., etc.], "cum sit modus et mensura et fines certi ultra quæ citra quæ nequid [*sic*] consistere rectum. Ideo consideratum est quod processus predictus irritetur, etc." Now, evidently the writer of that judgment might have taken this passage from his Bracton, or even, what is less likely, from his Fleta. Or, perhaps, Bracton's use of it had made it a commonplace. Or was it, possibly, already a commonplace when Bracton used it?

So far we have spoken of the relation of the 'Note Book' to Bracton. But the interest of it, as connected with other books and authors, does not end with what has yet been stated. "There can be but little doubt," says Mr. Maitland, "that, some two hundred and fifty years after its making, it came to the hands of another very famous lawyer, of Chief-Justice Sir Anthony Fitzherbert, who published his 'Grand Abridgment' in 1514. . . . If Bracton introduces, Fitzherbert closes one great period of English law, the age of the Year Books." Mr. Maitland gives his reasons for this opinion, and they are very strong. We will merely indicate them. Fitzherbert has 214 cases from the reign of Henry the Third, of which 207 are from the first twenty-four years of the reign and are all in this book, and seven only are from the later thirty-two years. The cases are taken from the same rolls and follow the same unusual order adopted in the 'Note Book.' And it tends a little to support this conclusion that here and there in the 'Note Book' words (like *Corona*, etc.) are scribbled in it in a hand of the fifteenth or sixteenth century, which may well have been the catchwords for a Digest:

"For a second time, therefore, our 'Note Book' entered into the history of English law. Mediately, through Fitzherbert, it became one of Coke's main authorities (the treatises of Glanvill and Bracton are the others), for what was law before the days of Edward the First, his only authority for the case law of those days. . . . That Coke had studied at first hand the rolls of the thirteenth century, there are very few signs indeed; he was dependent on Fitzherbert, and Fitzherbert was dependent on this 'Note Book.'"

It strikes a reader's attention that the number of cases in Bracton and in Fitzherbert which are also found among the 2,000 of the 'Note Book,' is very nearly the same. But a look at the tables given by Mr. Maitland indicates that they are not the same cases. Was there an attempt on Fitzherbert's part to select such only as were *not* in Bracton's treatise? It looks a little like that; and one wonders what that may mean. The reader also finds himself curious as to the intermediate history of the 'Note Book'—from Fitzherbert to Mr. John Holmes of East Rexford. Could not something be done to clear this up, by working backward?

And, now, what is it that one finds in the 'Note Book'? This is not the forum for any extended answer to that question, nor have we room for it now. But it may be said in a word that it is a mine of treasure for the student of our ancient law. To one who has any acquaintance with the learned researches of the Germans into the old Frankish and Germanic law, it will have much interest—both giving and receiving light. And, again, as a link between the older law and the Year Books, it will help to a better understanding of much in these dark volumes which the lawyers of their own time did not understand. The puzzling subject of the secta and the various substitutes for it, and the earlier usages as to trial by jury, are illustrated in many of the cases. As regards the law of real property, "numberless points are here set in a clear light." There is much relating to the jurisdiction of the spiritual courts. Wager of law and trial by battle are in full operation at this time. Selden remarks (*Duello*, c. 8): "Rare are the examples of battels waged upon criminals in the annals of the English laws, and (if I forget not) the least plural number doubled comprehends as many as are therein reported with ensuing performance"; and thereupon he cites three cases from the Year Books. At least three more may be found in the 'Note Book.' A highly interesting class of cases are the appeals from the county and hundred courts; they disclose the antiquated procedure and usages that long held their own there, when newer ideas had made great headway in the King's Courts. We had marked a number of these cases for quotation, but they must be omitted. "In the eyes of a few connoisseurs," says Mr. Maitland, "the gems of this collection may be two cases which seem to show that feoffments to uses are as old as the days of Henry the Third." But perhaps in this, as a learned friend suggests, the author seems to intimate a greater significance in those cases than they really have.

It should be added that Mr. Maitland has collated all his cases with the originals at the Record Office so far as the rolls are now extant; and that he has also done his readers the same good turn as in his excellent publication, three years ago, of the 'Gloucester Pleas of the Crown,' in extending the abbreviated Latin of the text. We have now, in Palgrave's 'Rotuli Curiæ Regis,' a copy of all extant rolls of the King's Courts from the beginning, in 1194, to the year 1200, being those of the sixth, ninth, and tenth years of Richard I. and the first year of John. Then come the invaluable selections of this 'Note Book,' running from 1217 to 1240; and also Mr. Maitland's other volume before referred to, the 'Pleas of the Crown for the County of Gloucester,' in 1221. And the much abbreviated contents of the 'Placitorum Abbreviatio,' in a way, carry us on from 1194 to 1327. These comprise about everything that we now have in print of that magnificent collection of judicial rolls now roofed within the Record Office in London. But we have a promise of more, thanks to the Selden Society, which is to issue to its subscribers very soon a collection of Pleas of the Crown, to be edited and translated by Mr. Maitland, which will help to bridge the gap between Palgrave's volumes and the 'Note Book.' In the good work upon which it is thus entering, we trust that the new society will be heartily encouraged by large additions to its funds and its membership. It is most fortunate in having at its service so learned, accomplished, and devoted a scholar as Mr. Maitland.

It goes hard with us to make any complaint whatever, but we have found ourselves wishing now and then that the index of subjects were a little fuller—at any rate in cross references—and that an index for the Introduction had not been omitted.

FOUR CLERICAL BIOGRAPHIES.

Life and Work of J. R. W. Sloane, D.D., Professor of Theology in the Reformed Presbyterian Seminary at Allegheny City, etc. Edited by his Son. A. C. Armstrong & Son.

The Life of Constans L. Goodell, D.D. By A. H. Currier, D.D., Professor of Pastoral Theology in Oberlin Theological Seminary. With an introduction by William M. Taylor, D.D. Anson D. F. Randolph & Co. Pp. xix, 486.

A Sketch of the Life and Episcopate of the Right Rev. Robert Bickersteth, D.D., Bishop of Ripon, 1857–1884. By his son, Montagu Cyril Bickersteth, M.A., Vicar of St. Paul's, Pudsey, Leeds. With a preface by his cousin, Edward Henry Bickersteth, D.D., Lord Bishop of Exeter. E. P. Dutton & Co.

Autobiography of William G. Schauffler, for forty-one years a Missionary in the Orient. Edited by his Sons. With an introduction by Prof. E. A. Park, D.D., LL.D. A. D. F. Randolph & Co.

Prof. Wm. Sloane's Life of his father consists one-quarter of biography and autobiography, and three-quarters of sermons and addresses. It is a valuable contribution both to church history and to the history of the anti-slavery movement in this country. The variously denominated Scottish-American sect of which Covenanters is the most honored name, had the peculiar distinction of being anti-slavery in its very constitution. As Dr. Sloane has recorded (p. 81);

"A few Covenanters in Orange County, N. Y., and quite a number of them in South Carolina, and a few, I think, in Tennessee, had, while their organization consisted merely of separate societies without a ministry, purchased, or in some way become possessed of, slaves. The commissions which organized the congregations required the members to manumit their human chattels. This they did in all cases: it is not known that a single person refused."

Even the co-sectaries of John Woolman have no such record as this. When Dr. Sloane's father removed to Washington Co., Ill., his congregation consisted largely of Covenanters who had removed from South Carolina, in order to escape the environment of slavery.

This sect had a further unique distinction, in that its members disfranchised themselves under the Federal Constitution, not only on account of its pro-slavery character, but also because of the absence of God in it, as the phrase goes nowadays. They held that to derive the just powers of government from the governed, and not from the Almighty, whose existence, even, was unrecognized in our national charter, was to establish an infidel commonwealth. Hence they would neither vote, except at elections relating to Constitutional amendments, nor hold office, nor do jury duty. This attitude placed them side by side with a body of men who equally renounced office and the ballot from anti-slavery scruples—the abolitionists, namely—but who were commonly branded as infidels in religion, and many of whom undoubtedly merited the designation in the strict evangelical sense. Had the Covenanters, therefore, put their theology above right living, they would have imitated the other denominations without exception in shunning and denouncing the abolitionists. They would then, too, merely have done what the orthodox wing of the abolitionists themselves, under the lead of the Tappans, William Goodell, and J. G. Birney, did at the great schism in 1840.

The Covenanters were of other stuff, however, and though their Calvinism was beyond suspicion, they welcomed all sincere opposition to slavery, without fear of the contagion of infidelity. Dr. Sloane, who had taught school in Kentucky and deepened his innate hatred of the system by close inspection of it, came as a Covenanter preacher to New York in 1856, and the next year found him a speaker on the anniversary platform of the American Anti-Slavery Society. His topic was "Slavery in Church and State," and the speech rightly stands first in the present collection. His private judgment of one of his new associates was that he was "a fanatic, but a tempest on the platform"; of another, that he was "an infidel, I believe an honest one." He knew that Garrison "was not an orthodox believer—and little wonder, when one considers the pro-slavery churches with which he came in contact." These defects did not hold him back from public coöperation with them while the struggle lasted; and this coöperation was not patronizing, but unaffectedly cordial and dutiful. He became prominent in this city among the few clerical abolitionists. At a prayer-meeting held in Dr. Cheever's church on the day John Brown was to be hung, "Dr. Sloane was present, and among others was asked to lead the meeting in prayer. 'You must excuse me, if you please!' exclaimed he; 'I am too mad to pray.'" During the draft riots of July, 1863, his house and person were in imminent peril, yet he would desert neither his home nor his congregation.

"But the writer," says Prof. Sloane, in a graphic passage (pp. 98, 99), "remembers well the old covered express-wagon into which the anxious father put his son on the first afternoon, and had him driven through quiet and obscure streets to the dock of the steamer, to be conveyed to a place of safety among his father's kind friends at Newburg. The closed shutters of the shops; the unwonted stillness of the streets in the absence of all traffic, broken only by the too loud rumbling of the shaky old vehicle in which he sat, or the distant howls which seemed all too near; the deserted sidewalks; the absence of stages and street-cars; the suspicious glances of every passer-by—all united to arouse awe and terror in his mind. The boat was loaded to the water's edge; and scarcely had she drawn out a few hundred feet into the stream when the roar of an angry multitude was heard with distinctness, as it drew nearer and nearer. As it gradually filled the pier, the scene beggars description. The men, without hats and coats, with uncombed hair, and frenzied by drink and excitement, waved their flaming torches in the air, and sent their hoarse cries of disappointed rage far into the calm heaven, and across the ever-increasing distance. The women tore their flying locks, and rent their flimsy rags, till many of them were naked to the waist, and, in frantic fury, with bloodshot eyes, added their shrill, brutal screams to swell the tumult."

Slavery abolished, Dr. Sloane continued his other great denominational object. It was not enough to have got the devil out of the Constitution; the vacuum was not filled unless God took his place *nominatim*. From 1868 to his death in 1886, this excellent man filled the chair of systematic theology in the Theological Seminary of the Reformed Presbyterians at Allegheny City, while also holding the pastorate of the First Reformed Presbyterian Church.

Prof. Sloane has discharged his filial task (undertaken on behalf of the Covenanter body) with perfect taste and discretion. The informal autobiography which he happily extorted from his father is a charming piece of writing, particularly interesting by reason of the reminiscences of early New England and Western country life. Dr. Sloane rightly laid most stress on his anti-slavery convictions and career, and gives a number of impressions of his fellow-abolitionists in addition to those we have already cited. In theological circles, two men once famous made a deep impression on him, the Rev. Robert J. Breckinridge, with whose colonization views he could have had no sympathy, and the Rev. Alexander Campbell, founder of the sect bearing that name, whom he styles "this truly great man." "Altogether," he adds, "it seems to me that he was more distinctly stamped with greatness, the the greatest-*looking* man I have ever seen. Perhaps in this respect Dr. Willson [Dr. Sloane's namesake] was his peer. The latter was as good as he was great. Alexander Campbell, I fear, was not."

Dr. Goodell was undoubtedly a man of great personal force and attractiveness. He found his sphere and his happiness in the work of a pastor, and so wholly devoted his life to the interests of the two churches which he served that he is almost canonized in the affectionate remembrance of his parishioners. His hand was felt also upon the larger interests of his denomination. A man of the broadest sympathies, he was forward in all the religious and charitable works of the city of St. Louis, where the last fourteen years of his life were spent, and worthily won an honorable name, and left a gracious memory, in that community. All this is told with great detail in the book before us, which will no doubt be highly acceptable to Dr. Goodell's personal friends, as a memorial for whom, we are informed, this biography was principally designed. Yet it seems to us to exhibit some grave faults both in matter and expression. The style is a return to the creeping leisureliness of the religious biography of a half-century ago. There is an intolerable amount of serving notice on the reader that something is about to be said, after the generous but mistaken manner of Mr. Winkle, in the scrimmage with the police, deliberately pulling off his coat and announcing in a loud voice that he was about to begin fighting. But it is no great wonder, after all, that the book gets on at such a slow pace, when we notice the immense burden of ornamental quotation which it has to stagger under. Such a pillaging of note-books we have not seen in many a day.

It also appears to us highly probable that some of the friends of Dr. Goodell will accuse this biography of the same fault that Carlyle found in Hare's Life of Sterling—that its view is too restricted, that it treats of its subject too exclusively as a clergyman. Dr. Goodell had the name, during his residence at New Britain, of being "the model pastor of Connecticut." Professor Currier has pitched his entire book to that phrase. His pages read like a series of lectures to his classes on the "lessons" for them to be derived from the experiences of Dr. Goodell. There is almost a complete absence of reference to any interest not strictly ecclesiastical. Thus, Dr. Goodell's early ministry was cast in the stirring times of the civil war, yet, beyond one or two casual allusions in his letters, we are told nothing of how he was affected in that heroic period. Nor do we discover the faintest reflection in this biography of the revolution in the intellectual world which has taken place since he began his ministry. It is incredible that he did not feel it. He was no scholar, but as a man peculiarly sensitive, as it would appear, to what was astir in the lives of his fellows, he must have felt it. But, for all this book tells us, he thought and said nothing of it.

We think, too, that the author has greatly erred in printing so large an amount of extracts from Dr. Goodell's private devotional memoranda, communings with his own heart, and records of matters surely never meant for the light. It seems to us that laying such things before the world is just as indelicate and as much to be deplored as the unnecessary personal revelations of some recent literary biographies. When Dr. Goodell uttered such things in life, they were redeemed from the suspicion of affectation by his healthy personality; massed in cold type, they are at once an injustice to him and a wrong to the reader.

The Bishop of Ripon was one of a family somewhat remarkable for its ecclesiastical fecundity and general success. John Bickersteth, his father, occupied a position of comparative obscurity as Vicar of Acton. One of his uncles was Edward Bickersteth, the famous Evangelical Churchman and Church missionary enthusiast, whose son is now Bishop of Exeter. Another uncle, Henry, is best known as Lord Langdale, a great lawyer, who, as Master of the Rolls, drew up the judgment in the Gorham baptismal controversy, of which Dean Stanley said that perhaps no decision of any council or holy office was equal to it in moderation and insight, preventing, as it did, a schism in the Established Church. A brother of Bishop Robert is now Dean of Lichfield. The father was one of that considerable company which combined with the fervor and piety of the Wesleys, from whom came their inspiration, a spirit of sober loyalty to the Church. These were the men who formed the Bible Society, who supported missions to the Jews, and, with Wilberforce and Clarkson, stormed against the slave-trade till the conscience of the nation was aroused to roll away that terrible reproach to England and to Christendom. Robert, walking in his father's steps, was always an Evangelical Churchman. Whether at Queen's College,

Cambridge, or as curate, vicar, and rector at successive stages of his later life, or at his final post, he was a hard-working man, in personal religion most devout (his mother's self-examinations in her Memoir, after the Bible, his most studied manual of devotion), and in the duties of his office most laborious and faithful. His bishopric—"under Divine Providence," we are told in a parenthesis—was the gift of Lord Palmerston. In his later politics he was distinctly liberal, but here, as in ecclesiastical matters, his zeal was always tempered with discretion, and his relations with both Gladstone and Beaconsfield were on a cordial footing. He preferred the activities of his diocese to those of the House of Lords, in which, however, he was not an idle listener. He spoke at length in opposition to the disestablishment of the Irish Church, being Evangelical and hence strongly anti-Romanist. In the prolonged discussion of the bill allowing marriage with a deceased wife's sister, he took the radical position for a conservative reason. He was a strict constructionist, and he was persuaded that the Bible did not forbid such marriages. For him that was sufficient, for he never questioned the supreme and absolute authority of the Bible as a divine revelation. Whether he avoided every modern study of the literature of the Old and New Testaments is not clear, but it is certain that these studies did not make on him the least impression. He passed through life without a doubt which he might not have had if the whole bulk of modern criticism had remained unwritten. For the heresies of the 'Essays and Reviews' he had only the sternest condemnation, but to the prosecution of the offenders he was steadily opposed. Disliking "ecclesiastical millinery," he put on the purple cope when it was commanded by "the Purchas decision," evidently feeling a little foolish when so doing. Not without opinions and preferences of his own, he had the tact, the suavity, and the easy subordination of himself to the higher powers which make the typical churchman, with much personal kindliness, in the most intimate relations of his life setting a good example, and making himself warmly loved.

Dr. Park's introduction to Mr. Schauffler's Biography is taken up almost entirely with an account of Mr. Schauffler's personality and habits and acquirements when he was a student in the Theological School at Andover. At that time the missionary spirit was stronger there than it had ever been before or has been since, and Mr. Schauffler's enthusiasm for the missionary work was so great that it not only had great influence on his companions, but established a tradition which was active and inspiring in the school for some time after he had gone away. What we lack in Dr. Park's introduction, and in the book as a whole, is some general estimate of Mr. Schauffler's missionary work. Mr. Schauffler nowhere attempts such an estimate in his autobiography, and we are left with the impression that the enthusiasm of the scholar somewhat outran the missionary's zeal for souls. To this it might be answered that it was his zeal for souls that made him an enthusiastic scholar. It was so at first, beyond a doubt, but, as he went on, the habits and the instincts of the scholar seemed to dominate all others. If it was not actually so, there is some defect in the proportions and the emphasis of the narration that it does not otherwise appear. As it is here set forth, the work of Mr. Schauffler was pretty nearly coextensive with his translation of the Old Testament into Hebrew-Spanish, and of the Bible into Armeno-Turkish. Here, of course, was the laborious fashioning of tools. What was accomplished with them is not made clear; perhaps it could not be. That, after a time, the work among the Jews came to an absolute halt, is painfully suggestive as to the outcome of the major part of Mr. Schauffler's undertakings.

Mr. Schauffler was born in Stuttgart in 1798. His father was for some years Mayor of the German population of Odessa, and this circumstance had much to do with shaping his career and fixing the scene of his activity when he came to man's estate. Having decided to be a missionary, he came to this country and to Andover to pursue his theological studies. His sense of backwardness was a continual spur, and he soon distanced his companions, especially in his knowledge of the Hebrew and the Greek. At the conclusion of his Andover studies, he was ordained a missionary of the Jews in Turkey, and afterwards studied Arabic and Turkish with the best masters of those languages in Paris, one of them the celebrated Sylvestre de Sacy. His work as a missionary did not fairly begin till 1836, when he settled down at Odessa, and was more at home than he could be anywhere else in the East. Meantime he had been married, and his family was increasing in the old-fashioned way of clergymen. The account of his marriage is one of the most entertaining passages in the book. That a relation entered on so perfunctorily should have brought him so much happiness, is not a little strange. In order to be quite sure that his own will was not to be followed, after he had written the letter, he let it lie over one or two posts, the mails at that time being carried across Asia Minor (the lady was at Smyrna) by a mounted Tartar. "When the day for its departure came, I shut myself up for the day for fasting and prayer, and commended the subject to the Lord, praying that if the step I had taken was not in accordance with his will, the letter might drop out of the mail-bag by the way—which, considering Turkish management at that time, could have been done even without any particular providence. But the letter was conveyed safely to its destination."

There is considerable of personal incident and observation in the book that is interesting. During the prevalence of the plague, and at various other critical junctures, Mr. Schauffler proved himself a man of sterling stuff. His other-worldliness did not prevent his seeing much that was beautiful along his mundane path. To his personal ideals he was as faithful as a man could be, and from a character so earnest and sincere and so affectionate much good must have gone forth to all who came in contact with him, whatever result there was from his special missionary work. He was born with the voice of music in his soul, and his flute was not the least among the consolations of his social and domestic life. His serious and happy course was ended in New York on January 26, 1883.

My Autobiography and Reminiscences. By W. P. Frith, R.A. Harper & Bros. 1888.

Mr. Frith's autobiography is a collection of anecdotes about himself and other people. It is written in a rambling style, and suffers somewhat because the author has not been satisfied with telling stories at first hand, but has allowed himself to include others from hearsay, in consequence of which there is a plentiful sprinkling of antiquated jokes in his pages. His own life was uneventful, and is interesting as much by being an example of a painter's career as for any other reason. There is a good deal about the class of models, among whom, of course, there are many strange people, whose biographies or characteristics serve to fill an idle page, and there is as much more about the tribulations of "the hanging committee" and their victims, interspersed with sketches of peculiar "R.A.'s," usually in a comic vein. But Mr. Frith saw a number of distinguished persons in literature and art, and had an eye for the humors of men. His encounters with literary men were not always pleasing. Once he was taken to see Thackeray at the club; he was then young and timid, and modestly sat in the background, perhaps with a little awe of the burly genius who was keeping the party in good spirits. Suddenly, on finishing a song, Thackeray turned to him as the applause died away, and said: "Now, then, Frith, you d——d saturnine young Academician, sing us a song"; and Frith continues, "I was dumb before this address, and far too confounded to say anything in reply. Encouraged, perhaps, by my proving myself such an easy butt, the attack was renewed a little later in the evening. 'I'll tell you what it is, Frith, you had better go home; your aunt is sitting up for you with a big muffin.'" This "paralyzed" the youth again, and he soon went away. The anecdote does no credit to Thackeray, and publication of it is, we suppose, Frith's long-delayed repartee. He found Dickens very friendly and agreeable, but his account of him is flat.

The reminiscences of painters make the bulk of the book, and of many of these he has something interesting to say. Turner, Landseer, Mulready, Wilkie, and Millais are the most notable of the circle. He tells of Turner's ridicule of his own pictures, and even comparing them to a salad before him: "Nice cool green that lettuce, isn't it? and the beetroot pretty red—not quite strong enough; and the mixture, delicate tint of yellow that. Add some mustard and then you have one of my pictures." The Great Duke occasionally appears as a figure at exhibitions. Frith says he always looked at the paintings of Waterloo with interest, but not more than he showed in other subjects, and once he heard him remark on one by Allan, "'Too much smoke,' said the Duke." He tells some of Sothern's practical jokes, which were really cruel, and sometimes wantonly played on strangers in such a way that the consequences were entirely beyond prevision and likely to cause real trouble. There is one instance of his sending an unsigned love-note to a strange lady in a box, couched in such terms as to imply great impropriety in the past; he saw the lady's husband capture the note from her unwilling hands and the two leave the theatre in a manner that threatened a scene when they got home. Here is an equally unfeeling example. An old friend of Sothern's had recently lost his mother; Sothern dabbled in spiritualistic deception, and at a séance had the spirit of this man's mother announce herself and rap out that if her son would put his hand under the table, the hand of the dead would touch it. He did so; and Sothern, having dipped his naked toes in ice-water, touched his friend's hand with them, and "the victim turned pale, the tears started to his eyes, and he fell back sobbing in his chair." We are glad to learn that when the trick was afterwards discovered, the "old friend" cut Sothern's acquaintance. "Dundreary's" jokes are retold, but they are still worth telling. For a sharp thrust of real life there is nothing quite so good as the remark of the orange girl who was asked by Frith whether she was not annoyed by the soldiers and street-loafers in Albany Street: "'Yes, sometimes she was bothered, but it was by swells. Gentlemen,' she said, 'is much greater blackguards than what blackguards is.'"

Such is the general character of a book

which is entertaining if it is not read too steadily. Frith himself appears as a good-natured, well-satisfied, harmless fellow, who enjoyed his life, worked faithfully at his art, succeeded with the popular taste, and has come to his old age with many good things of the world in his possession. There are no "views" in the volume, but several workmen's rules about how pictures ought to be painted. He insists that everything should be drawn from some real object, and he approves of painting the forms before any draperies are put on them. As a whole, however, it is a book for gossips.

Natural Resources of the United States. By Jacob Harris Patton, M.A., Ph.D., author of a 'Brief History of the Presbyterian Church in the United States,' etc. D. Appleton & Co. 1888.

In compiling this work Mr. Patton had access to an enormous amount of material, and had he possessed the requisite scientific and technical knowledge of the various subjects treated to enable him to discriminate between what was entirely trustworthy and what was either evidently exaggerated or scientifically unsound; or if, in the absence of such qualifications, he had confined himself simply to the task of preparing a condensed statement, in popular form, of the facts contained in the annual reports of the United States Geological Survey on the Mineral Resources of the United States, he might have produced a work of permanent value. As it is, he has supplemented this material by extracts from the reports of the Governors of thirty-one States and Territories (ninety-four volumes were sent him on application), from State and railroad handbooks to encourage emigration, and from various other "authentic" sources. His work is mainly founded on the above-mentioned reports on mineral resources, and adopts their general system of subdivision, but leaves out all their tabulated data, except the general condensed table of production. This portion is probably trustworthy, because it is the business of the technical men who prepare these reports to separate the wheat from the chaff in the data which come into their hands. How much of the balance is good, bad, or indifferent seems to be more or less a matter of chance. In spite of the author's statement in the preface, that due credit is given to authorities consulted, but few names or titles of works are mentioned as authority for quotations, and those that are, however good their standing in the Church, are not always such as would be accepted as authorities by the sceptical scientist.

Such statements as that "iron is the only metal that can be welded," that "black sands in streams are limonite," that "no true coal is found west of Kansas," and that "the Rocky Mountain coal beds were first discovered at Cheyenne," evince the author's want of acquaintance with his subject, and his too great readiness to accept pleasing stories without verification. These are examples of actual divergence from fact. The selection of some (probably interested) person's statement that a certain alum deposit "covers an area of 1,600 acres, and may be termed a mountain . . . of almost chemically pure sulphate of alumina," rather than the far more conservative description of it as impure, given in 'Mineral Resources,' which corresponds with the analysis he himself gives; and the frequent mention of "practically inexhaustible" deposits of various materials—are, on the other hand, rather evidence of his abundant faith in the "immense resources with which the Creator has endowed this land" than of the critical and conservative spirit which should characterize a work of this kind.

It is a pity that such blemishes should appear in a work on so fruitful a subject, and one which, as regards form, type, and paper, is so admirably got up. It contains a great amount of useful information leavened with some mistakes; a few false statements, especially as regards scientific definitions; and various exaggerations.

Hegelianism and Personality. By Andrew Seth. Second Series of Balfour Lectures. Edinburgh and London: Blackwood. 12mo, pp. 230. 1887.

Small as this book is, it may be called memorable, for it rings the funeral knell of a school. The philosophical achievement which we of English-speaking lands have effected in this generation has been to outgrow the indigenous form of empiricism in which we were reared. Twenty-five years ago all of us whose education had any outlook and vitality were pupils of the Mills and Bain. Hamilton was the only native philosopher having authority enough to stand as their counterpoise, but his erudite scrappiness hardly led anywhere. Spencer and evolution were not yet triumphant. German philosophy was for the most part a sealed book. Ferrier of St. Andrews was too esoteric and quixotic to count. The "common-sense philosophy" taught us officially by the college presidents, even with Cousin's latest rhetorical touches, was uninspiredly fighting a retreat. We either became cordial and enthusiastic Millites, or gave unwilling submission because we saw no deliverer from the body of this death. Since then, what a change! Evolutionism sweeping in like an inundation; psychology born anew out of the physiological laboratories; logic transformed; continental philosophy grown familiar; one of those great periods of expansion which, chaotic as their immediate results may be, make everything that preceded them seem out of date. Bain and Mill have in a few short years come to appear altogether childlike, old-fashioned, and quaint.

Meanwhile, in the seething cauldron, where a Spencer boiled over in this place and a Lewes bubbled in that, where a Hodgson, a Jevons, a Sidgwick, a Martineau, and others rose and sank, and rose again, there was only one place where a real *school* of higher thought seemed forming, and that was where Green and Caird, with Kant and Hegel in their right hand, Ferrier and Stirling behind them, and Bradley, Watson, and a troop of younger ones at their side, were uttering, in English words of much impressiveness, what they conceived to be the essential discoveries of the Germans, and pointing out how meagre, abstract, insufficient, and irrational was the Associationism dear to the English mind. Few movements in philosophy have shown more rapid and vigorous life than this Anglo-Hegelianism of the last few years, already begun in America through the devotion of the editor of the *Journal of Speculative Philosophy*, but soon outstripped and outshone by the writers across the wave.

The critical work of the school has probably "come to stay." It will be hard after this for educated men to regard any abstract way of conceiving the world as the true way, so plain has it become that the only true world is the total world. It will be hard, too, for Associationism, with its denial of any real unity in consciousness, to make much more of a fight. But, as far as constructive work went, it was evident from the first that there was bound to be an uproar in the school-house; and, sure enough, the *débâcle* has come. Messrs. Bradley and Seth were the disciples from whom most was hoped. But Bradley's Logic dealt many a felon blow; and now, more cruel still, Professor Seth inflicts what are pretty sure to be mortal wounds, and overtly arrays himself against that saintly man, but strenuously feeble writer, Green, the leader of the school. This notice must be so short, and the points at issue are so esoteric, that the detail of them had better not be opened up at all. Suffice it that Professor Seth plants himself squarely on experiential and pluralistic ground, refuses to interpret as a universal consciousness that "ego" which (as analysis shows) is involved in the nature of knowledge, and, finally, insists rigorously on the chasm between Logic and Fact.

The independence shown in Mr. Seth's earlier writings has thus come to maturity; and now that he is back in what seems really the normal intellectual attitude of our race, and fully conscious that he is there, may one not hope for some positive and constructive work from his pen? More than any of our younger writers on philosophy, he has the classic quality. His learning, vigor, luminousness, ease, delight the reader on every page. Why, with all the spoils of the enemy's camp to enrich him, will he not now set forth empiricism in an adequate and modern way? Can it be that he, too, finds this sorry writing of books about other books, which is the bane of our generation, so much the easier task?

Musical Dictation. By Frédéric Louis Ritter, Mus. Doc. Novello, Ewer & Co.

The Standard Opera-Glass. By Charles Annesley. B. Westermann & Co.

The majority of music teachers no doubt pay too much attention to the conquering of merely mechanical difficulties of execution. They forget that the fingers can learn their tasks in half the time if they are guided by intelligence and taste. This error is beginning to be recognized, and such works as Lussy's on 'Expression,' and the late Mr. Christiani's 'Principles of Expression in Pianoforte Playing' (which every pianist should study), are paving the way for better pedagogic principles. Dr. F. L. Ritter, of Vassar College, has just issued a work which will help along this movement. In his 'Musical Dictation' he gives a series of rules and exercises that will teach students of music to write down pieces that they know by heart. Extensive experience convinced the author that "in order to strengthen the musical memory in the right direction, and teach students to *think* musically, they ought to possess the faculty of writing down correctly all that they are able to play or sing correctly by heart; in this way the musical sense becomes sharpened, the more delicate shades of time, rhythm, the cut of the melodic motive and its expansion into phrases and periods, will be impressed upon the mind more vividly and more distinctly." He also points out that these exercises will assist pupils in the art of listening; and that they are invaluable to those who are ambitious to compose is self-evident. Dr. Ritter's definitions are always clear, and his examples well chosen; and this little book, which forms one of the series of Novello's music primers, may be commended to all teachers, private and in public schools. It can also be used by two students dictating to each other in the absence of a teacher.

From Westermann & Co. we have received another little book containing the plots of the most popular operas of the day. This is the fourth, so far as we know, in the English language. It differs from the others in the

arrangement, which follows the operas alphabetically instead of the composers. While not equal to Upton's, it is better done and more complete than Boosey's and "Notelrac's." It also indicates the change in operatic taste by giving full accounts of Wagner's later operas, which are omitted in the two works last mentioned. The list includes eighty operas.

The Story of the Fifty-fifth Regiment, Illinois Volunteer Infantry, in the Civil War. By a Committee of the Regiment. 1887.

It is not uncommon to see, in the literary columns of our newspapers, cynical, if not sneering, allusions to the stream of military literature that has poured with increasing current upon the present generation. The captious paragraphist tells us that the public is tired of the "*Century* War Series," of military histories, of the memoirs of generals, and of the stories of campaigns and battles. But still the great stream somehow flows on, and the thirsty multitude drinks of it, and remains unsatisfied. Whether or not the public is growing tired of the contributions of leaders, it certainly still has a relish for trustworthy accounts of the doings and sufferings of those who, with muskets on their shoulders, bore "the heat and burden of the day." Of all such accounts few better have appeared than 'The Story of the Fifty-fifth Illinois Volunteers.' Three members, Captain Lucien B. Crocker, Captain Henry S. Nourse, and Sergeant-Major John E. Brown, shared in the composition of the book, each doing a separate part, the closing chapter being by Chaplain John L. Haney. Each contributor is entitled to the praise or blame which belongs to his part of the work. The job is well done, and all deserve praise, not blame. The truth, in just enough detail, is set forth with frankness, courage, and an evident purpose to be just. Alleged deficiencies and shortcomings of high officials are mentioned as parts of the story that had to be told, but there is no evidence of animosity or personality. Some question might be raised as to the soundness of the military criticism in the book, but fortunately there is very little of it. The only feature of the work to be seriously deprecated is a bitterness of feeling that some of the writers express towards their former foes. In this age of a reunited, prosperous, and happy people, of reunions between Federal and Confederate soldiers, of general harmony and good-will, it seems out of place to file, in a book of this sort, a dissent from the right of "rebels" to take part in the control of the Government, or the wisdom of the policy that long ago permitted them to do so.

This straightforward account, bearing upon its face the stamp of truth and accuracy, of what men in regiments actually saw and did, affords a pleasing contrast to the overdrawn pictures and exaggerated stories that characterize Frank Wilkeson's book called 'Recollections of a Private Soldier.' Illinois has a right to feel proud of her Fifty-fifth Regiment of Infantry, and that regiment may congratulate itself upon the work of its historians.

Uncle Sam at Home. By Harold Brydges. Henry Holt & Co. 1888.

This little book is worth putting in the pocket if one is starting on a railroad journey, but its merits are chiefly negative. The author has evidently studied our newspapers and talked with all sorts and conditions of men. He has travelled through the country by rail and has kept his eyes and ears open; but his intellectual equipment is not extensive enough to enable him to generalize from his observations. His judgments, therefore, do not rise above the level of ordinary newspaper correspondence, and remind one of the conversation of a rather superior commercial traveller. But, although superficial, he is entertaining. His style is fresh and clear, he has collected many striking facts, and his quotations and anecdotes are cleverly presented. There is not a trace of British prejudice in the book, and both praise and blame are distributed with much friendliness and good sense. The author has achieved a mastery of current American "humor," and it is impossible not to be amused by his selections from the exploits of our orators and story-tellers.

BOOKS OF THE WEEK.

Carhart, Prof. D. Treatise on Plane Surveying. Boston: Ginn & Co. $2.

THE LIFE OF THOMAS HOPKINS GALLAUDET,

Founder of Deaf-Mute Instruction in America. Square 12mo, with portraits, $1.75.

"The book has the subtle charm of the best biography."—*Hartford Post.*

UNCLE SAM AT HOME.

By Harold Brydges. 12mo, illustrated, $1.25.

"The book is one of the most readable and brightest that have issued from the press for a long time."—*Hartford Post.*

JEAN MONTEITH.

By M. G. McClelland. Leisure Hour Series. $1.00.

"It is a pretty, well-told, and artistic story. The heroine is a charming creation, full of life, tender and true to a noble standard of humanity. . . . There is a sub-tragic vein in the story which maintains the interest steadily, and, as most readers will appreciate, yields at the proper moment to the influences which are to set everything straight."—*N. Y. Tribune.*

"It is fresh and charming. . . . The volume is too thoroughly good to be hurt by flaws."—*N. Y. Commercial.*

MRS. ALEXANDER'S 'A LIFE INTEREST.'

Cloth, $1.00: paper, 30 cents.

The Man Behind.

A SECOND SUCCESS by T. S. Denison, author of 'An Iron Crown,' is equal to its noted predecessor, which has been pronounced "one of the world's great novels."

"Marked by originality, force, and novelty of scene and character. It has a plot and a good one. The book is full of dramatic situations and incidents, and exhibits in places a remarkable analysis of the workings of the human mind. It depicts the struggle between ambition, cupidity, and conscience. Frequent touches of human nature either pathetic or humorous, a careful and graphic style, powerful and realistic character drawing, and a faithful portrayal of time and locality, combine to make Mr. Denison's novel a strong and not easily forgotten work."—*Daily News, Chicago.*

"The ways of the world are disclosed in a most telling manner. Even its secrets are given away, and therein lies the great interest of the book."—*Ohio State Journal.*

"Vigorous and lifelike."—*Brooklyn Eagle.*

"From preface to finish it is of entrancing character."—*Albany Press.*

"One thing is certain, whoever begins to read this story will read it to the end."—*Utica Press,*

The hero has in his history a magic akin to mesmerism. It is a heart throb of humanity. The story of his fall, remorse, triumphs, and defeat, is a picture that is destined to glow permanently in the pages of English literature.

In any family, whether large or small, but especially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Prof. J. B. Fonssagrives's 'Mother Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1.25 for two volumes. Address Publisher of the Nation.

The Nation.

NEW YORK, THURSDAY, MARCH 29, 1888.

The Week.

THE death of Chief-Justice Waite was so sudden and unexpected that most people were probably surprised to learn that he was a man well along in his seventy-second year, who had earned the right to retire on a pension a year ago last November. He had but recently completed his fourteenth year of service, having been appointed in January, 1874. Judge Waite was Grant's fourth choice for the Chief Justiceship, and his nomination was received by the country with a profound sigh of relief after the remarkable selections which the President had previously made. The place was first offered to Mr. Conkling, who had never shown any qualification for it, but happily declined, as "Senatorial courtesy" would doubtless have secured his confirmation Grant next hit upon George H. Williams, then his Attorney-General, who was not only without proper legal qualifications, but was positively disqualified for other reasons. When it became evident that Williams could not be confirmed, Grant gave the country a fresh surprise by sending in the name of Caleb Cushing, who was already four years past seventy, and who, in his long career, had become better known for craft and shrewdness than respected for integrity. Cushing was quickly done for by the production of a letter which he had written in 1861 to "my dear friend" Jefferson Davis, recommending another friend of his, a renegade civil servant, to the President of the Confederacy. While everybody was wondering what surprise Grant would next perpetrate, came the nomination of Morrison R. Waite, a man only slightly known to the general public, but of excellent repute and record as a lawyer and as counsel for the United States before the Geneva tribunal. The appointment was hailed rather as a happy escape than as a conspicuously fit one, but the Chief Justice has grown steadily in public estimation, and he leaves an eminently respectable name.

The death of the Chief Justice, following within a few months that of Justice Woods, foreshadows an early reconstruction of the Supreme bench politically, so far as a majority of its members are concerned. Of Lincoln's five appointees to this bench only Miller and Field survive, and they were both born earlier in the same year with Waite. Of Grant's four appointees, Hunt and Waite are dead, Strong retired, and Bradley was seventy-five years old last week. Blatchford, Arthur's appointee, was sixty-eight a few days ago. Fortunately, these changes in the Supreme Court did not begin until the old issue which formerly divided parties had been settled. The "State rights" question was formally and finally disposed of by the Supreme Court while all its members were the appointees of Republican Presidents; "the necessity of the autonomy of the States and their power to regulate their domestic affairs," to use the language of Justice Miller, having been reestablished, after the unsettling period of war and reconstruction, before a Democratic President had a chance to make a single appointment. The great distinction of the late Chief Justice will be the fact that he threw the weight of his influence on the right side when the highest judicial tribunal was annulling unconstitutional laws passed by a Congress of his own party, and that he did not shrink from joining in a decision on the Virginia debt question a few weeks ago, which was "regarded by all classes in Richmond as a fixed and final triumph of State sovereignty." There was a time when the fear of a "State rights" bench appointed by a Democratic President would have caused widespread apprehension, but the course of events has been such that the wildest partisan organs will now find it difficult to arouse alarm over the prospect that Mr. Cleveland is to appoint a Chief Justice.

Mr. James Russell Lowell will deliver another address in this city April 13, on the invitation of the Reform Club. It will probably be full of politics, and will cause renewed agitation among the Blaineites. It is almost impossible to avoid making them howl in any political speech not delivered on behalf of Blaine, because they resent as insulting to their fetish all praise of any other public man, living or dead. If one who is known not to admire Blaine speaks well of Washington's integrity, for instance, they suspect him of alluding to Blaine's crookedness. If he eulogizes Macaulay as an historian, they think he means to depreciate 'Twenty Years of Congress.' If he speaks highly of Hamilton Fish's diplomacy, they conclude he means to deride Blaine's "Pan-American" conference. But the climax of annoyance is reached if he calls the President upright or disinterested, because this is always received in Blaine circles as a veiled allusion to the Little Rock and Fort Smith bonds and the Mulligan letters. As it would be hard for Mr. Lowell to make a speech without praising somebody, we may therefore look for "lively times" among the "aut Blaine aut nullus" people.

The London correspondent of the *Tribune* telegraphs that "nothing affords Mr. Blaine so much amusement as the Democratic and Mugwump comments on his refusal to allow his name to be presented to the National Convention, etc." But the same correspondent telegraphed December 6, 1887, that Mr. Blaine "laughed—he is always laughing." It would seem, therefore, that either Mr. Blaine is afflicted with cachinnatory hysteria, or he is so easily amused that there is nothing wonderful in the amusement he gets out of the Mugwumps and Democrats. The truth is, however, that the discussions over all his sayings—his refusals and assertions and denials—are very amusing, and amuse even the gloomiest men of all parties. The difficulty his followers have in interpreting his utterances, the general unwillingness to accept any of them as final, the "further explanations" that follow them, and the various modes in which exposures of his ignorance or untruthfulness are met, have been making people laugh now for ten years. The hardest blow his admirers have received is the announcement that he sees the fun of it all himself.

There could hardly be a better sign of the times than the debate on the tariff in Boston on Saturday between Mr. E. P. Wheeler of this city and Mr. Butterworth, the member of Congress from Ohio, the former representing the Massachusetts Tariff Reform League, and the latter the Home Market Club. The Tremont Temple was crowded with people eager to listen to the controversy, and their plaudits and interruptions showed their keen interest in the subject. Mr. Butterworth was naturally embarrassed by his advocacy of free trade with Canada, which, of course, is not to be justified by the standard tariff arguments, but he made as good a fight as can be made on the anti-British line of defence. If the association of bad, wicked England with a low tariff had been taken out of his argument, there would have been but little left. Mr. Wheeler, on the other hand, was undoubtedly much aided by the effect of the Trusts on the popular mind. Arrangements for keeping up prices are, in other words, discredited just now as they never have been before; and consequently any one who says a good word for the poor consumer receives a more attentive hearing than he has done for many a day. But no matter who gets the best of it, the fact that the subject is at last being debated before popular audiences is a great thing for the country, and full of promise for the future.

The Louisville *Courier-Journal*, by its Washington correspondent, foots up 142 Democratic votes for the Mills Tariff Bill, together with 5 Republicans and 4 Independents—total, 153. In a full house 163 votes will be required to pass it. These must be obtained from the Randall Democrats—19 in number. What is meant by passing the Mills bill is not stated by the writer. If he means that the Mills bill as it stands, with all its items unchanged, will receive 153 votes, we take leave to doubt the statement very seriously. But if he does not mean this, he means that some bill, after running the gauntlet first of the Committee of the Whole and then of the House, will pass, which is a very different thing. We do not believe that the bill as reported, or as it may be reported, will come anywhere near passing—not because it is not a good bill, or as good as all the circumstances, political and other, will allow, but

because every local interest touched by it will make a desperate effort to change the particular item which concerns itself, and will, in many cases, succeed in doing so. The necessity of reducing the revenue, however, makes a vast difference between present circumstances and those of 1883. This necessity is imperative and overwhelming. Consequently the Mills bill may, and probably will, pass, but it will be a very different thing from the present bill. Its value consists more in the shaping of future political issues than in the particular items contained in it. Even if the final shape of it should be the taking of the whole revenue reduction off sugar and tobacco, we should consider it a measure of great value and importance, since it would not only relieve the strained financial situation, but would present to the country a new set of ideas to work out and vote upon, swamping the Southern question and all the faded and fading issues of the past quarter of a century.

Among the numerous Trusts springing up in every direction, the Halibut Trust is entitled to some consideration. This is a fish trust, and is closely connected with the fishery dispute that has been the cause of so much international disquietude. The Boston *Herald* recognizes, in the names of the persons prominent in the Halibut Trust, several that have been prominent in protesting against the "surrender of our rights" in the pending treaty, and who are urgent in favor of immediate "retaliation." In case retaliation is put in force so that Canadian fish are wholly prohibited, the *Herald* expects that a Cod Trust and a Mackerel Trust will be formed immediately. Why not? Is there anything more absurd intrinsically in a Smoked Herring Trust or a Sardine Trust than in a Sugar Trust or a Lead Trust? Certainly not. Let us have all the Trusts we can—subordinate, of course, to the great Tariff Trust. They are all for the advantage of the laboring man, because the more money the Trust is enabled to levy on the community, the higher wages it is enabled to pay. But when we come to consider the pending Fishery Treaty, it is consoling to know that there is a Halibut Trust opposing it with might and main.

The Chicago *Tribune* gives a very instructive account of the headquarters of the managers of the engineers' strike in Chicago. They have rooms which would be the best in the hotel if they did not front on a courtyard. They are very large and luxuriously furnished, and Chief Arthur's bedroom adjoining is one of those expensive ones which have bath-rooms attached. They cost $20 a day, or $500 for twenty-five days. Men who are directing a strike have to be comfortable, and make a good show to the monopolists when they call on them. Besides these, the Brotherhood is paying for other rooms at the European National Hotel, where the C., B. and Q. Grievance Committees sit. The bills here are also very heavy, and the telegraph bill is said to be huge. The result of all this is that about 1,000 men are thrown out of work for an indefinite period, and must live for some time to come on the funds of the Brotherhood. In other words, the strike has proved a total failure, and, besides the loss to the men, has inflicted great loss on the railroad and on the community. In resisting it, the C., B. and Q. was simply asserting the right to manage its property in its own way, opposing the doctrine of compulsory hiring, which asserts the right of laborers to stay in other people's service against the employer's will, on their own terms. It is for the enforcement of this doctrine that Powderly concocted the maxim that "the injury of one is the concern of all," and initiated the practice of sympathetic strikes. The answer to it all is that mankind could not, in the existing condition of human nature, extract even a bare living from Mother Earth under any such arrangement. Mother Earth has fixed matters in such a way that the human race at present can only make itself comfortable through the plan of having every man mind his own business, and rigidly refrain from unloading on his neighbor, or meddling in his neighbor's affairs without the neighbor's consent.

Gov. Larrabee of Iowa was very neatly caught by President Perkins of the Chicago, Burlington and Quincy Railroad in the correspondence which was printed last week. By way of harassing the road in the interest of the strikers, the Governor wrote that "frequent complaints had of late been made to him concerning the interruption of freight and passenger transportation caused by the strike of the engineers, as well as the danger arising from the employment of incompetent substitutes for such employees." This Mr. Perkins took quite seriously, and said: "I will esteem it a favor if you will kindly have transmitted to me a statement of all complaints which have been or may hereafter be brought to your attention, in order that we may endeavor to render satisfaction in each case." He also offered "to make payment in full" by way of damages where liable. We need hardly say the brave Larrabee was not prepared for this. So he made answer:

> "In compliance with your request, I shall take pleasure in forwarding to you any claim for damages that may in the future be brought to my attention. While the inconvenience caused to the public by the present strike has been the subject of much complaint, my intercedence to recover damages has thus far not been requested."

In other words, either he had evolved the "frequent complaints" out of his gubernatorial imagination, or they came from the strikers themselves.

The sympathetic strike of the switchmen on the Chicago, Burlington and Quincy Railroad of course must end as the strike of the engineers has done, in the employment of other men to fill their places, with more loss to the road, heavy loss and suffering to the men and their families, and considerable delay and interruption to business. The general result will be, that at the end of the year both labor and capital will be worse off in consequence of these strikes than they would have been, though their relations to each other will not be changed. People who expect some great revolution in the organization of modern society in consequence of these labor troubles, would do well to take note of these facts. Labor troubles, in the existing condition of intelligence and character, cannot possibly produce a social revolution of any kind. They can cause disturbance, delay, and diminution of profits, and increase the timidity of capital, but they cannot introduce any new order of things. All the great social changes have been the results either of increased mental and moral culture on the part of the masses, or the increased ascendency on the part of the cultivated few. Discontented ignorance has done nothing for the world thus far, and never can. The only solution of the labor question thus far offered by Labor in this country is that great enterprises should be controlled by their employees under the despotism of a small knot of outside professional agitators, and that the lazy and incompetent man should be paid as much as the diligent and capable. Of course these are not wonder-working suggestions. In fact, sensible men do not consider them at all, and civilized society in the long run is carried on by sensible men.

Another important decision bearing upon the question of prohibition has just been rendered by the Supreme Court. The State of Iowa, by a law passed in April, 1886, attempted to prevent any railroad company from bringing liquor into the State unless the company had been furnished with a certificate from the County Auditor of the county to which the liquor was to be transported, showing that the consignee was legally authorized to sell it. This was equivalent to denying any citizen of Iowa the right to order and have brought to him, even for his own sole use, any liquor by any railroad company from outside the State. The court declares this law invalid, holding that the power to regulate or forbid the sale of a commodity after it has been brought into a State does not carry with it the right and power to prevent its introduction by transportation from another State, and that such legislation would be an unauthorized interference with inter-State commerce. The *Iowa State Register* pronounces this "a pretty serious blow to the cause of prohibition in Iowa, as it will inevitably lead to a large traffic in liquor in the State from other States."

The stringent working of the new High-License Law in Pennsylvania is calling forth loud complaints from the brewers. They cannot take out licenses for as many saloons as they please, as they have done heretofore. In fact, they can take out none at all. As about half the saloons in the city have been closed already, there is a great falling off in the sale of beer, and it is said that nearly all the smaller breweries will be forced to shut down. The larger brewers say that they shall have to reduce

the number of their employees from a half to two-thirds, and declare that in all probability 9,000 of the 12,000 hands at present employed will be discharged. A manufacturer of brewers' wagons says, that, since the law went into effect, orders which he had for twenty new wagons have been countermanded. A dealer in horses for brewers says that his business has also been greatly injured. Just how much exaggeration there is in these complaints cannot be ascertained, but there is evidently a good deal. Still, there is no doubt that the law is restricting the liquor traffic seriously, and as a consequence all branches of it are affected more or less. This is a most encouraging development, for heretofore in Philadelphia, as in New York, the law has not operated as a check, but has been rather an aid to the great brewers in their eagerness to increase to the utmost the facilities for the sale of their product.

It is very natural that the Presbyterians North and South should be anxious to italicize this their centennial year by an organic reunion of the two great sectional divisions of their Church. Indeed, the sentimental considerations in favor of union now appear to be more powerful than the sentimental considerations which tend to keep up the separation. The hitch will come in matters of practical detail, if at all, and, among these, the hardest to handle is the status of the colored people under the new arrangement. From the published correspondence of the committees on reunion, it would seem that the Northern committee is disposed to accede to the Southern demand, and to set off the colored Presbyterians in separate presbyteries, even when conterminous with white presbyteries. This would be a recognition of the color line highly distasteful to many of the Presbyterians of the North, and in the teeth of the professions of the Northern Presbyterian Church. That it would be an abandonment of the practice of the Northern Church, however, as is asserted in some religious papers, is not so clear. Of course there are occasional colored members of Presbyterian churches in the North, who are tolerated and even made at home among their white brethren, though usually, we believe, in the guise of interesting objects of charity among the church's poor. But, so far as we know, there is no colored Presbyterian church in the North affiliating on equal terms with white churches of the same denomination, or even a church in which the colored membership rises above the most insignificant fraction.

If this were all the difficulty before the Southern Church, it would be no difficulty at all. The trouble arises in view of the larger masses of colored people at the South, and the question is how to deal with the two or three colored presbyteries of Florida, Georgia, and the Carolinas, composed wholly of colored members, and established as the result of missionary effort conducted by the Northern Church among the freedmen. They have been in as complete isolation from the Northern Church as from the Southern, with the exception of being entitled to representatives in the General Assembly, and that privilege is to be accorded them under the suggested arrangement. So that, practically, the proposal involves no change at all for the Northern Church, and the committee from that branch of the denomination seem to think it unfair to force a social difficulty upon their Southern brethren which, they doubtless feel, their own Church would shrink from meeting were the question one of practice and not sentiment. It certainly ought to be remembered, in connection with these pending negotiations, that in some cases—for example, in home missionary work in Texas—the Northern Church has already drawn the color line as sharply as the Southern; even a "Northern" Presbyterian church there having to be, as a minister of one such remarked, "either one thing or the other, white or colored, no mixing allowed."

The State Treasurer of Kentucky, one Tate, has defaulted and absconded. The assets he has left behind are very curious and a little "racy of the soil." One item is $75,000 in due bills from friends to whom he had lent the State money. Another, and the best, is 600 barrels of fine old whiskey, estimated at $50,000. That a man harassed, as he must have been, with pecuniary cares, should lay up so much whiskey, shows what a place this product holds in the Kentucky mind. It evidently stands where diamonds stand in other countries, as the thing to put money into for a rainy day. There used to be an old story of the Kentucky gentleman's travelling outfit consisting of two bottles of whiskey and a clean shirt to wrap them in to keep them from breaking; but that belonged to the day of small things, before the telegraph and telephone and electric light. Whiskey is now "carried" in broker's offices and public stores, instead of in gripsacks.

A mere glance at the work cut out for the Woman's International Council in Washington ought to be enough to send James Anthony Froude's heart down into his boots, and to convince him that no amount of talk from him will induce the talkers to stop talking, or even cut down their talk. "Papers" are to be read on fifty-one topics, if we have counted rightly, and discussion is to follow each paper. Besides this there is to be a sermon, a "Conference of Pioneers," and a symposium, and a farewell address, a song from "Lohengrin," and a solo on the violin. A full stenographic report of the proceedings is to be printed day by day. All this is to be the work of one short week. It will be a bad week for the Senators and Representatives who have not as yet made up their minds on the leading questions of female politics. The scarcer they make themselves, the better it will be for their peace. Most of the topics on which the talking is to be, are of a practical character, so that it is possible to communicate information as well as "views," and we, therefore, are satisfied, Mr. Froude to the contrary notwithstanding, that the talk, voluminous though it be, will do good, help to correct mistakes, and make some dark things clear.

We have, what is very rare, two *causes célèbres* pending in this city at present—both will cases, and both very odd in their way. One is nominally an attack by her blood relatives on the will of the late Mrs. Stewart, which gave ex-Judge Hilton half the residue of her estate, and, curiously enough, was drawn by himself, but it is really an inquiry into the way in which nearly the whole of A. T. Stewart's vast fortune was transferred to the same person, although only $1,000,000 was bequeathed to him in the will. The case will probably grow in interest as the trial proceeds. Ex-Judge Hilton's own examination or cross-examination by Mr. Choate will probably be one of the most interesting forensic spectacles of our time. The contest over Mr. Tilden's will concerns the claim of the city to about $4,500,000 for a public library, one of the most splendid gifts ever made for such a purpose. There could hardly be a better illustration of Mayor Hewitt's account of the composition of the city population than the small amount of interest taken by the public in this magnificent contribution to its higher welfare. Few seem to know, fewer still to care, much about the matter. If the will should be set aside and the money for the library lost, we doubt if there would be a word of lamentation, except something formal in the newspapers.

The Ministry have been making very distinct gains in England during the last two or three weeks in the sense of making the dissentient Liberals more contented with their lot, and readier to remain in the Tory camp. The Local Government Bill is as democratic in all its features as any that Mr. Gladstone would have introduced, and Mr. Goschen's budget is probably the best that any Chancellor of the Exchequer except Mr. Gladstone has produced in these later years. He is, after Gladstone, probably the most competent man in English public life to make a clear financial statement. In the present case, too, he has the immense advantage of coming to Parliament with a surplus, and being able through his conversion scheme to promise a reduction of taxation. His conversion of the public debt when fully carried out will reduce the annual charge by over $10,000,000, which to Englishmen, whose surplus rarely exceeds that amount even in good years, is a considerable gain. The applause with which his proposed imposition of a tax of $25 on race horses was greeted was due partly to the disgust excited by recent "turf scandals," partly to the belief that if anything be a luxury it is a race horse, and partly to the feeling even of sporting men that there are far too many "meetings" and too many horses in the field either for the good of the breed or the good of sport.

THE CHIEF JUSTICESHIP.

To a man of legal training and judicial temper, interested in the study of principles and the development of institutions, ambitious to participate in the government of his country and to leave an enduring mark upon its history, the Chief Justiceship of the United States Supreme Court is the most attractive position in the nation. The tenure of office is for life, unless the incumbent chooses to retire upon a pension equal to his salary after reaching the age of seventy, and he is thus freed from all anxiety as to his old age. He is never troubled, as Senators so often are, by the fear that a political revolution or the temporary loss of public favor may end his career with the current term, and he escapes that terrible but inevitable revulsion which overtakes the man who has been President when he retires from the White House into obscurity. If he is appointed in middle life, he has before him the precedents of men who held the office for periods of twenty-eight and thirty-four years, and may anticipate seeing several generations of Congressmen and several executive administrations come and go while he keeps on his way.

The first Chief Justice clearly perceived the preëminence of the position. When the Government was organized, Washington offered Jay the choice of all the offices at his command, and he selected the headship of the Supreme Court. As he resigned after six years, because he believed it his duty to the people of New York to accept the Governorship, Jay's incumbency was too brief for him to realize his ideal, but Marshall, who served from 1801 to 1835, demonstrated the great possibilities of the place. For a third of a century Marshall was, as the Chief Justice should be, the dominant personality in the Court, and Taney, who succeeded him and served nearly as long, came to wield in his turn the paramount influence in the tribunal. Ill health and the Presidential fever combined made Chase's comparatively brief service hardly worthy of his earlier fame, and Waite never quite measured up to the full requirements of the office, highly respectable though his record was. The varying experience of the nation with Chief Justices has only served to emphasize the great importance of the office which a man of Jay's power deemed the most desirable, and there will be no lack of candidates for the existing vacancy.

It is a remarkable fact that, although the Chief Justiceship is the highest judicial office in the land, its incumbents since the beginning of this century have been men who had previously held no judicial position. Waite had not even had a case before the tribunal when he entered it, and his only legal service outside the ordinary practice of his profession had been as counsel of the United States at Geneva. Chase had been Governor of Ohio, Senator, and Secretary of the Treasury, but never a judge. Taney had been a member of the Maryland Legislature, Attorney-General of his State, and Attorney-General of the United States, but never a judge. Marshall had been member of the Virginia Legislature, Representative in Congress, and Secretary of State, but never a judge. It will thus be seen that it is as true of those who made the greatest careers in this office as of their less conspicuous successor just deceased, that they became the chief judge of the country without having held a subordinate judgeship.

It is also true that there have been great associate justices who went upon the highest bench, like their chiefs, without previous service upon any bench. Take two cases, one in our earlier and the other in our later history. Story, who sat for nearly a quarter of a century with such distinction beside Marshall, had been a member of the Massachusetts Legislature and a member of Congress, but never a judge, and, indeed, had practised law only ten years when appointed. Miller, whom Lincoln appointed in 1862, was educated a physician and practised medicine for eight years. He did not even begin the study of law until he was thirty, and he had held no judicial office, nor indeed any office of any sort, when elevated to the highest bench sixteen years later. Miller's case is perhaps the more striking of the two. Both were worthy of the Chief Justiceship, but Story was somewhat overshadowed by the greater Marshall, whereas for years Miller has been the dominant figure of the court. Nobody can examine the series of decisions rendered since the war, which have brought the Government back to its ancient moorings, without perceiving that Miller's has been the controlling mind, or without feeling that he ought properly to have been also the titular head of the court.

It would, of course, be absurd to argue that vacancies on the Supreme bench should only be filled from among men who had served on no lower bench, but it is obvious, in the light of such history, that the field of choice should not be restricted to men who are or have been judges. Other things being equal, such service would be an advantage; but if the President finds a man whom he considers conspicuously fit for the tribunal devoid of such experience, he should not consider it a drawback. The country doctors of Kentucky who had known Miller when he was an M.D., doubtless thought it odd when they heard not many years later that he had been made a judge of the highest court; but experience showed that Lincoln knew his man. With Republican administrations at Washington from 1861 to 1885, and Republicans controlling most of the States during the same period, Democratic lawyers have stood but a poor chance of holding judgeships, but Mr. Cleveland need not feel restricted to the comparatively short roll of such judges. If he can find the man who will prove a second Story or Miller, it will be no objection that he has never been a judge before.

One qualification should be insisted upon in any case. The appointee should be a man of vigorous physical constitution and in the prime of life. It is every way desirable that changes in the Chief Justiceship should be as rare as possible. Two men filled the position from 1801 to 1864, whereas the latest two incumbents served only from 1864 to 1888, or considerably less than half as long. Taney's case was exceptional, as he was 59 years old when appointed, and yet sat for 28 years, but Marshall's record of 34 years was due to his appointment in his 46th year. Forty-six was the age of Miller, who has already served nearly 26 years, and appears good for a number of years yet, and Field, who joined Miller in 1863, was born in the same year with him. Wayne, who sat 32 years, was 45 when appointed; and McLean, who also sat 32 years, was 44 when he received his commission. Of late the tendency has been towards appointing older men, Lamar, Blatchford, Hunt, and Strong having been 62, Waite and Bradley 57, and Chase and Matthews almost 57; but it is not a tendency to be encouraged, in view of the fact that Chase and Hunt broke down before they had served ten years, and Strong retired on a pension after ten years' service. By the time he has reached forty-five or fifty a man has had a chance to prove his quality, and if he goes on the bench then, experience shows that he will stand an excellent chance of doing good service for twenty-five or thirty years. The Chief Justice named by Mr. Cleveland in 1888 ought to be a man who, barring accidents, may be expected to keep at work until 1915 or even 1920.

THE SENATE AND INTERNATIONAL COPYRIGHT.

EARLY in the present Congress (December 12, 1887) Senator Chace presented his proposed amendment of the Revised Statutes, which extends, under certain conditions, the protection of the domestic copyright law to the productions of foreign authors and artists. The bill was referred to the Senate Committee on Patents, and there became the personal charge of the Senator from Rhode Island, who has been untiring in his efforts to put the project upon such a footing as should secure for it an affirmative vote in the Senate. To this end the chief concern has been to adopt such a text for the International Copyright Bill as would secure the support of all persons whose interests should be in any way affected by it. The success which has attended the repeated conferences between the representatives of the typographical unions, the publishers, the authors, and Senator Chace, was demonstrated at the hearing held in the room of the Senate Committee on Patents on Friday, March 9, where representatives of all classes concerned in the production of books were unanimous in advocating the passage of a bill with a final compromise text (the result of the various consultations), approved by the Senator having charge of it.

But five members of the Senate Committee on Patents took any part in this hearing, and of these no more than four were present at any one time, while for the greater part of the session only three members were in their seats, and but two remained during the entire conference. With the exception of the intelligent interest exhibited by the Senator whose bill was under discussion, there was the same expression of apathy so noticeable two years ago, when this subject was under consideration before the same Committee. It was bluntly intimated that

there was no desire to hear anything concerning the abstract right of an author to his literary property, or any arguments as to the equity of granting him proper legal security for the same; and even Mr. E. C. Stedman's remarks urging the need of "protective" legislation for the authors of America, in order that they might have a reasonable chance to live by their mental labor, and that our native literature should have a fair opportunity to develop, fell upon inattentive ears. It was only after the representatives of the sixty thousand or more typesetters, pressmen, stereotypers, etc., members of the various typographical unions, had made known their adhesion to the bill, that any expression of interest took place. But Mr. G. H. Putnam's clear and cogent statement of the present status of authorship and publication in the United States, and the result it was reasonable to expect from the passage of an international copyright bill, did produce a marked impression upon the members of the Committee present.

While slight interest was manifested in regard to the possibility that the passage of the proposed law would tend to elevate the national taste in literature, the reiterated question was, "Will the passage of an international copyright bill make books dear?" It is to be understood, of course, that this question was asked with the mental reservation: "after proper *protection* has been accorded our publishers, printers, and binders." To pay honestly the foreign author a modest price for his property, which we have appropriated for our own benefit, and at the same time remove the uncivilized restriction put upon the spread of knowledge, and cheapen literature by abolishing the iniquitous tariff upon books, was a proposition which it did not seem possible for the Committee to entertain. The real question in the minds of the Committee, apparently, was the possibility of affording sufficient protection to our book industries, and, in addition, securing to the foreign author his moderate percentage, without placing upon American readers a burden heavy enough to tempt the latter to revolt against our pet system; and the only alternative was to allow the continuance of the present method of literary piracy, aided and abetted by our tariff laws. For the important consideration was the preservation of "the protection principle of the country."

The bill was reported by Senator Chace Monday, March 19, and assigned a place on the calendar, and it seems fairly probable that it will succeed in passing the Senate. In that event no accusation can be brought against that body of any infringement of the above-named principle, because the bill provides for its extension to every class concerned in the production of books, even American authors for the first time coming in for a share of the benefits. The latter constitute almost the only class of producers in the United States who have not had the benefit of tariff protection; and not only that, but the American author has been obliged to bring his production—the manuscript of a book—into the market in direct competition with the printed copy of a book which the publisher has obtained without the necessary expenditure of a single penny of cost, simply because of the absence of honest legislation to prevent the reprehensible seizure of the foreign author's work.

Nor is this the only advantage which the American reprinter has enjoyed at the expense of the author. An equitable application of the so-called protection principle would suggest that the duty of 25 per cent. levied upon imported books for the benefit of American bookmanufacturers, should have been confined to books written by foreign authors. This would allow the native author to take advantage of the privilege accorded to him by the domestic copyright law, of having his manuscript put into a book wherever he could have the book manufactured at the lowest cost. In that case he would have 25 per cent. the advantage of his foreign author competitor, which is precisely the amount of advantage secured to the American publisher as against the foreign publisher by the present tariff duty. And the author's honest gain over the American reprinter in the cheaper material production of his book would go to offset the latter's dishonest advantage obtained by the piratical appropriation of the foreign author's manuscript or printed copy, and would allow the former to furnish his book to American readers at a very material reduction in price, and yet with an increase of profit to himself.

But the mite of "protection" which is to be secured to the American author by the proposed law is simply this: that when he takes his completed manuscript to a publisher to be printed, he will do so assured that the publisher must offer him payment for it with the knowledge that he can no longer obtain a similar production by a foreign author for nothing, but must pay something, at least, to the foreign writer for his work if he prefer it. And this protection is to be obtained by obliging the American reprinter so to pay the foreign owner—like any other *honest* dealer—for his raw material, and is, therefore, a very different thing from the protection now secured to the reprinter by extracting a heavy toll from the foreign publisher who attempts to invade this market. But to obtain even such protection as this, the American author is asked to aid in robbing himself of the privilege referred to above, viz., his right to print his manuscript wherever he pleases, by advocating a measure which obliges him to manufacture his book wholly in the United States in order to secure any copyright at all.

ANOTHER WARNING FROM CONNECTICUT.

Two years ago we presented the experience of Connecticut with the Western Reserve Fund as an argument against the scheme of Federal aid to Southern schools. When the State sold her lands in Ohio, the proceeds were devoted to a school fund, and as the fund proved very productive, the income during the early part of this century ranged from $70,000 to $100,000 a year. This was a large sum of money for a small State in those days, and it was expected that it would serve to elevate the standard of public education materially above the level previously reached, when the people had supported their schools entirely by taxation.

But the fund proved to be a curse instead of a blessing. Mr. Charles D. Hine, Secretary of the Board of Education, summarized the effects in a letter to the *Evening Post* published February 6, 1886, which attracted wide attention. "The history of our State," he said, "shows conclusively that at the time when the fund was most productive, yielding $1.40 or $1.50 for each person of the school age, and when towns depended upon it, as they generally did, for the support of their schools, the schools themselves were poor and short. In fact, this was the darkest period of our educational history. A very striking deterioration took place as soon as the fund became productive and the income began to be distributed. Before that period, schools had been maintained at least six months, and at most nearly the whole year, according to the size of the district. After, and not long after, this new source of income was opened, the usual length of schools was reduced to only three months, or just the time that this fund would maintain the schools. The sums which came as gratuities relieved the people of responsibility and deadened their interest, until the schools were continued only so long as the charity lasted." The evil gradually cured itself, as population increased and the fund grew proportionately so small that the people could no longer depend upon it, until Mr. Hine was able to say, "Happily the danger from this direction is passed and cannot return."

This early experience of Connecticut was alone enough to constitute an unanswerable argument against the policy of educational subsidies, but, curiously enough, its force is strengthened by a later experience of the same State with school funds which came unexpectedly from abroad. When the surplus revenue of 1837 was distributed among the States, Connecticut received as her share $764,670, and an extra session of the Legislature was called to decide what should be done with the windfall. It was finally decided, after a stormy and confused discussion which lasted nine days, that the money should be deposited with the several towns, in proportion to their respective populations, on condition that they should keep and preserve it as a deposit and in trust for the State, should repay it into the State Treasury if it should ever be called for, and should appropriate at least one-half of the annual income to the promotion of education in the common schools. In 1855 an act was passed requiring the whole income to be devoted to common schools, so that for nearly two-thirds of the period since the money was received the entire benefit has by law been given to public education.

Mr. Hine has made a thorough investigation as to the history of this fund in every town of the State, and in his recently published annual report he presents a summary of the facts which is very impressive. It appears that, although the original act provided that

"the principal of this fund shall remain permanent, and no part thereof shall be used for any purposes other than those designatad in this act," which were educational, about five-sevenths of the entire sum has been borrowed by the towns from themselves, as trustees, in times of emergency, and town orders or notes given as security, the whole proceeding in most cases consisting of entries on the books which enabled the towns to use the money without increasing their interest account. In the majority of cases the towns do not regard this sum as a liability, and do not put themselves in the position of borrowers, but have simply taken the fund as though it belonged to them. "In fine," says Mr. Hine, "the towns which were made trustees of a fund devoted to the education of their children, have so far violated the fiduciary relation as to borrow from themselves a fund intended to be permanent, and given upon the condition that it be preserved; and the fund appears, if it appears at all, as debt from the trustee to the beneficiary. In many cases all traces of the fiduciary relation have disappeared, and the town alone enjoys the benefits of the trust in a diminished indebtedness."

The question whether the fund has promoted education is already practically answered by this exposition of its general misappropriation, but Mr. Hine answers it in detail by showing that it does not add in any sense to the sum which towns devote to their public schools, as they would be obliged to raise no more by taxation if the interest reported were to drop out of sight and the fiction of a fund disappear. Its main purpose, he says, has been to relieve towns that were in a tight spot by enabling them to discharge or avoid their debts, and thus diminish their interest charges, and he can find no evidence that it adds to the number of schools, increases attendance, decreases illiteracy, or, indeed, benefits the schools in any way. "The surplus which the general Government bestowed, and which the State endeavored to direct into an educational channel," he says, "has not relieved the State from its responsibility, nor lightened its burden of taxation. The money has drifted away from schools, which must depend, and do depend, upon the liberality of the people."

We may add that the experience of Connecticut in this matter has not been exceptional. In his 'History of the Surplus Revenue of 1837,' Mr. Edward G. Bourne has traced the fate of this fund in each of the States which participated in the "divide," and shown that in nearly every case where it was originally devoted to schools, it has been either entirely lost or so misappropriated that scarcely any permanent advantage has been reaped. One such lesson ought to suffice for the nation, and the warning of 1837 should be heeded by those who have ignorantly supposed that good schools could suddenly be secured by dumping a large slice of the surplus of 1888 into the Southern States. As Mr. Hine well says, in concluding his review of Connecticut's history: "There is no doubt that the present attempt to again distribute to the States a surplus would result as before. Not even a temporary stimulus to education would be afforded; the tendency in every State would rather be to so order things that the gratuity should relieve from all responsibility and endeavor. The honorable public duty of providing free education for all children would be shirked, and the day of educational independence long delayed."

JAPANESE TREATY REVISION.

THIRTY-FOUR years ago the Japanese allowed the thin end of the wedge of diplomacy to be inserted in the closed shell of their isolation. While Perry initiated, in 1854, the main treaty, in which he even exceeded his powers and the orders of his Government, his interpreter, Dr. S. Wells Williams, innocently went still further beyond the demand for supplies and asylum, and introduced the "favored nation" clause, article ix. With the purest of motives, he yet furnished unwittingly a mighty weapon for the humiliation of Japan. In the commercial treaty secured by Townsend Harris in 1859, and in the later conventions obtained by seventeen nations, this clause was copied; and another, conferring exterritoriality, or exemption from the law of the land, was unsuspectingly yielded by the Japanese.

Though unintended and unforeseen by the originators, there has been built upon these contracts a potent engine of oppression that now threatens the very existence of the empire. A system of consular courts has been devised, which is little else than a shield for crime. Eighteen different codes of law are in operation at Yokohama, with as many methods of trial for one crime. The Japanese are practically a conquered nation, so far as their ownership of the sea front, waterways, and land occupied by the seven foreign settlements is concerned. They are not allowed to regulate their own customs, and are held to an agreement forced on them at Ozaka in November, 1865, under the guns of a British man-of-war. They cannot guard the lives of their people by quarantine regulations against contagious diseases. Under menace of war, when a war-ship of the German navy convoyed the *Hesperia* to Yokohama and landed her passengers, they were compelled to allow an infected vessel to bring the cholera scourge to Japan in 1879. As the direct cause of loss of life to the people, this proved to be worse than the bloodiest war known in the empire for four centuries. Though this so-called heathen nation has expended millions of dollars in creating and supporting one of the finest lighthouse systems in the world, she is unable to collect a single penny of tonnage duties on ships lighted to her own ports by her own beacons. The promised revision of treaties has been put off year after year. The costly embassies sent abroad to plead for the repeal of the odious exterritoriality clauses have come back disappointed and heart-sick. Over 3,000 settled Caucasian foreigners live in her five ports and two cities, doing an export and import business amounting to many millions annually, yet paying no taxes except a nominal ground-rent. Japan is thus obliged to lay four-fifths of the burdens of taxation upon her farming population. Despite her high credit abroad, she is considered to be on the verge of bankruptcy.

When the treaties were made a generation ago, the Japanese, long secluded as hermits, were as children in political knowledge. They had only a very limited knowledge of foreigners, and these in the form of marauding or shipwrecked whaling sailors, often of a muscular and violent type, whom they promptly caged, fed, and on opportunity shipped through the Dutch out of the country. Hence, they were only too glad to allow foreigners to control their own criminals, thinking themselves well rid of a bad job. So also in trade questions, apart from points as to exchange of coinage, on which they insisted to their hurt, they willingly yielded first to Mr. Harris and then to Lord Elgin. The hermit in the market-place soon found, however, that these people who had plenty of war-ships became inveterate in interpreting the treaties always in their own favor. In defiance of Japanese law and protest, they fixed precedents first made in conquered countries as a foundation, and then added others, until a lofty structure of "sacred rights guaranteed by treaty" was built that seemed, and has thus far proved, as solid and impregnable as the fortress of Gibraltar. If the Japanese made obstacles, they were threatened with various dire results, and, after tasting bombardment at Shimonoseki and Kagoshima, they could only keep silence, for it was while the country was rent with domestic troubles, and the Yedo Government was in its death throes, that this mighty superstructure arose. When, after 1868, by the genius of the Mikado's ministers, a new government was established and a new nation formed, they found that under cover of the exterritoriality clause the most dishonest and dishonorable acts were committed. Besides, it seemed as if the foreigners were encouraged by their own ministers and consuls to defy wantonly the decencies and proprieties of a sensitive people. Hence, their first movement after feudalism fell was the despatch of an imposing embassy, headed by a noble of highest rank, to plead at the courts of civilized nations for the abrogation of the odious clauses. Despite their assurances that Japan had changed her political and social systems, they were unanimously refused, and returned crestfallen and disappointed.

Nevertheless, unable to command success, the leaders of Japan set to work to deserve it. The mere catalogue of reforms wrought since 1870 is an eloquent plea for justice by treaty. In the difficult and delicate responsibilities of diplomacy, the postal service, steam and coasting traffic, the management of railways, lighthouses, or quarantine—in short, in all the enterprises of public service wherein life must be guarded or the conveniences of civilization secured to foreigners, as well as in the keeping of promises and obligations—the Japanese have proved themselves worthy of confidence, and have extorted the praise of critics for their scru-

pulous fidelity. Persecution abandoned, religions tolerated, hundreds of Christian churches organized and unmolested, and revolutions in caste, dress, social freedom not only permitted, but encouraged, show the earnestness of Japan's desire to part with the Asiatic past, and to enter into the life of the West.

During the long years of her distress the sympathy of but one nation has been made manifest. The United States, though commercially almost wholly a purchaser rather than a seller, has in repeated acts of well-meant, if not complete, justice, shown a desire to do the right towards a weaker neighbor. Withdrawing the steamers of the Pacific Mail Company, and yielding to the Japanese the right to their own coasting trade, and negotiating a postal treaty on equal terms, they accompanied these acts by the purpose to grant Japan the right also to control her own customs. The treaty signed July 25, 1878, and actually ratified and exchanged at Washington April 8, 1879, was made null and inoperative by the tenth article, which proves how closely American diplomacy was then, at least, if not now, in the leading-strings of Europe. That article restricted "the two Governments from giving effect to their convention until, by the voluntary act of each and all the other treaty Powers holding relations with Japan, they shall consent thereto." In other words, the European Powers had threatened Japan with a one-sided application of the "favored nation" clause, and it was not convenient for the United States to be as independent as Fourth of July orations and common profession would indicate, and the matter was dropped. Another act of imperfect justice was the return of the extortion money, known as the Shimonoseki Indemnity Fund, in 1883, shorn, however, of a sum called "prize-money" and of another amount equal to the principal, namely, the accumulated interest for many years at 7 per cent., notwithstanding that the Japanese had borrowed the money of London bankers, paying 9 per cent. To crown all, two years ago the Extradition Treaty was made and ratified. This latter is a fact of great significance, because it implies an approach to equality in criminal law, and the logic and sequence of it must be the abolition of consular courts, with their multiplying scandals. It only remains now to revise the treaties in the interest of righteousness, to abolish in due time exterritoriality, and to grant Japan the recognition of sovereignty.

For the doctrine of exterritoriality, the existence of consular courts, and the general system of diplomacy based on the modern theory of civilization as against barbarism, there was once a reason. So long as in certain countries of Asia or Africa State and Church are one, and politics are based on creed, civilized governments cannot treat them as equals, or allow their citizens to encounter the risks of an inferior jurisdiction saturated or tinctured with fanaticism. Were Japan a religious Power, like Turkey, she might be treated as is Turkey. On the contrary, it is not difficult to show that our Government would be justified in reversing old custom and diplomatic precedent, and yielding in due time the right to Japan to control American citizens residing in the empire. To withdraw from the entangling alliance with European Powers seems the first duty. To recognize the right of Japan to self-government, and abolish consular jurisdiction after sufficient time is given for mutual convenience, is another. Apart from the question of justice to Japan, the only fear, even of the hostile critic, is that her jurisprudence be inferior to our own standard. We have only to remember, however, that such a standard is not demanded of many countries, Russia and the South American republics, for instance; while we must not forget that since 1881 the revised criminal code of Japan has been in excellent working throughout the empire. Torture was long ago abolished, decapitation by the sword ended in August, 1881, and cruel and unusual punishments are now no more. Further, the Japanese expect to furnish such guarantees as will satisfy the reasonable demands of foreigners. Their record of twenty years past, and what we know of them as a people, inspire confidence that what they promise to do they are able to perform. Before the end of 1888 they expect to have their completed codes finished and translated. We therefore hope that the present Administration, which has always with promptness and energy given attention to American interests in Asia, has been noted for its quick removal of incompetent envoys, and has negotiated the Extradition Treaty with Japan, may reopen negotiations for the revision of the old treaties, and crown its achievements by meting out justice to a weaker nation.

THE LATE MRS. ANN BENSON PROCTER.

SINCE the death of Miss Mary Berry, London society, or that part of it which is not wholly given over to commonplace, has lost no one more irreplaceable than Mrs. Procter. The stepdaughter, through her mother's second marriage, of Basil Montagu, she was descended on the spear side from that Scheffer who, with Fust and Gutenberg, makes up the inextricably triune effigy of the inventor of printing. Her mother, through whom she was cousin to the present Archbishop of Canterbury, had, as Miss Benson, been in correspondence with Burns. She herself was the widow of Barry Cornwall and the mother of Adelaide Procter. A more purely literary pedigree were hard to find.

Born with the century, and retaining all her faculties to the last, the mere accumulation of years would have made her a personage, had she no other claim to the distinction. Her death snapped the last living link which united the literary world of to-day with that of more than two generations ago. She had vivid personal recollections of Wordsworth, Coleridge, Keats, Lamb, and Hazlitt, as little sallowed with time as her later memories of Rogers, Hunt, Thackeray, and Dickens; to speak only of the dead. Except Byron and Shelley, she had known, and in some cases intimately, as only an agreeable woman can, every greatly or less renowned English man of letters for the last seventy years. To name her friends is to name them all. Of many she was the intimate correspondent; of not a few the trusted confidante. Clever by natural endowment, she grew constantly more clever by collision with witty and agreeable people to the last. Those who had known her in Wimpole Street, found her even more vivacious in Albert Hale Mansions. Her handwriting of last year had the same untremulous precision it had sixty years ago. She realized for this generation the octogenarian girlhood of Ninon de l'Enclos. To the lovely view which her windows there commanded over the tufted greenery of Kensington Gardens, she was indifferent. Her inner verdancy supplied her. It was the Town she loved, and when she went out of it to make visits (never till the season was over, of course), she would have been bored and cross had she not found a fairish fragment of the Town awaiting her at the country-house.

In her eighty-seventh year she was still a courted and assiduous diner-out, going and coming in her *growler*, nor ever forgiving a hostess who sent her in to dinner with a dull man. On him she avenged herself by saying clever things to him, about which he fumbled uneasily, and then by dramatizing the scene with immitigable *verve* for the more trusted friends at her next Sunday or Tuesday afternoon reception. If not the cleverest woman in London, a thesis which might be not unhopefully maintained, she was beyond question the most thoroughly equipped. Not easily to be matched in narrative, reminiscence, and unprinted or unprintable anecdote, she was past mistress in epigram, repartee, and that bland innuendo which is more deadly the more harmless it seems. A thorough woman of the world, her mind had that easy-going movement, that freedom from jolt or creak, that comes of constancy to long-practised grooves. Scantily endowed on the imaginative side, and vigorously contemptuous of conventional sentiment, she yet had all the graces of mind and phrase which seventy years of unremitted commerce with the pick of society could give. Exigent of the *bienséances*, insisting upon the rigors of the social game, we cannot but fancy that she would have preferred *Et ego in Bohemia* to *Et ego in Arcadia* on her headstone. But it must have been a Bohemia with a seaport and all the other proprieties. She shed cares and sorrows lightly, and her face was pitilessly smooth from any record of them. She was a faithful friend and as faithful a foe. If she had not charity, she had in full measure the tolerance which is inculcated by experience. There was only so much woman in her as she could not help—her sex. She seemed to have held over by some occult bequest a reversion of the last century, thoroughly at home though she was in the present. Taken for all in all, she was such a type as we shall not see again. There was a certain hardness in her, not, it seemed, of the natural grain, but the long result of some petrifying process carried far enough for the surface to take a protective polish. Alas, extreme old age has seen and felt so much, has outlived so much, and yet found a relish in life! Nay, she was lovable too in her own way, though she would not have demanded or expected a tear upon her grave. She was a thoroughly brave and self-sufficing soul.

It is hard to conceive of her in that Other World of which she never spoke and perhaps never thought, of her there—with faculties so perfectly and exclusively trained for the conveniences and enjoyments of This. But if her days here had been little given to serious things, yet her keen intellectual interest in the shifting scenery of life saved her from that collapse of character and individuality which sooner or

later overtakes the merely frivolous, and makes us wonder if such vague beings can continue. She is gone, we will not doubt, where old friends will be glad to welcome and later friends to follow her. She has left a void in many lives which may not ache, indeed, but which no one else can fill.

ENTRANCE REQUIREMENTS IN WOMEN'S COLLEGES.

BOSTON, Mass., March 5.

AN interesting phase of the higher education of American women is seen in the position now taken by the leading women's colleges in regard to their requirements for admission. To appreciate fully their present attitude, a résumé of their history on this point is necessary.

When Vassar was opened in 1865, vague ideas of the number and qualifications of the women who demanded a college education prevailed. A huge building was erected, and students were invited to come. No entrance examination was attempted. In the words of the late President Raymond:

"There were no established precedents for a woman's college. Of the 350 students with whom the college began, a respectable minority, say one-third, had been well taught, a few admirably, but of the majority it could not be said with truth that they were thoroughly grounded in anything. The first year, no attempt was made to grade the students by any common standard. *Toward the close of the second year, a part were arranged in classes.*"

Of 352 students, it was necessary to classify 165 as specials and 71 as preparatories. The conclusion was inevitable, that the instruction given in the girls' schools throughout the country was generally inadequate to a suitable preparation for a college course, and that a preparatory department was a necessity. Yet the authorities at Vassar recognized the need of enforcing a high standard of entrance conditions, and as, from time to time, they found themselves supported by public opinion, they increased both the number of subjects and the amount required, and also the thoroughness of the examinations for entrance to the Freshman class.

In 1875, when the two new colleges for women were opened at Northampton and Wellesley, Mass., the position of Vassar in regard to this question of entrance conditions was as follows:

(1.) The requirements for admission, in quantity and quality, were equivalent to those in the best colleges for men, excepting Harvard.

(2.) All examinations were conducted at the college by the faculty.

(3.) The conditions of admission were strictly adhered to.

(4.) None were admitted, on condition, to membership in any class—that is, not until examinations in all the requirements had been passed.

(5.) No one was allowed to *recite* with a college class in any study in which she had not passed an examination on all the requirements for that class in the desired study. A few such advanced students were classified as "specials."

(6.) All other students were classed as "preparatories," even when they had passed in all but one of the requirements for the Freshman class.

(7.) The students were graded as follows: In the four college classes 214, specials 11, preparatories 159.

Wellesley opened in September, 1875, and, accepting all applications for admission to the extent of its accommodations, repeated Vassar's experience of ten years before. Students were received who were deficient even in the preliminaries, and it was found necessary, report said, to give instruction even in arithmetic and the elementary history of the United States. Like Vassar, too, Wellesley had built a large building. Its 300 students slept under a single roof, and ate in one large dining-hall.

In the same month, Smith College, also, received its first pupils. Vassar's acknowledged experience had taught the founders of Smith that the presence in a college of a large number of younger students, as yet unprepared for collegiate studies, affected unfavorably the tone of the whole institution, both socially and intellectually. It was believed that the grade of the secondary schools for girls had sufficiently improved to render a preparatory department at Smith unnecessary, and to make it possible to demand of *all* that standard of preparation required by Yale and Amherst. A private residence was Smith's first dormitory. In his opening address, the President said:

"I believe this is the only female college which insists upon substantially the same requisites for admission which have been found practicable and essential in male colleges. It seems useless to talk about advanced education to those who have not yet reached its starting-point. Unless a college insists upon enough preliminary work to carry out its design, it must soon be encumbered by many who might spend their time more profitably in ordinary schools. Instead of advancing, the teacher is obliged to go back with his pupils, and to consume time which should be devoted to a higher education in wearily expounding the first principles of a lower."

The soundness of this opinion was proved by the effect which immediately followed its enunciation and subsequent application. A hundred students tried the examination. The majority failed. Twenty passed and twelve entered. The moral effect was great. Teachers and pupils began to look towards passing the examinations of Smith College as the worthy goal of a student's ambition. Only such buildings as were absolutely needed were erected. The fear of financial loss, arising from the occupation of a large dormitory by a few students, was avoided.

About this time, the relations of the large State universities to the public-school system began to be generally discussed. Public attention was called to the method of admitting by certificates from the preparatory schools, in place of examination by the college. Michigan University declared that its experience was evidence of the advantages of the new policy. In 1877, the women's colleges had begun to accept new students on certificates, but had not generally adopted the safeguards of the Michigan scheme.

The Faculty of Vassar resolved:

(1.) "That all candidates for the Freshman class, coming from *schools* which have *previously sent students* prepared for *unconditional* admission to that or any higher class in this college, will be admitted without examination here, on the certificate of the *principals* of said schools (based upon a general examination *immediately* before their coming) that they have mastered the entire requisites for admission as set forth in the latest catalogue, or equivalents accepted by the Faculty.

(2.) "That the admission of every such student shall be regarded as probationary until the Faculty, on personal knowledge of the student, shall make it absolute.

(3.) "That this privilege shall be continued, in the case of every such school, until a candidate coming from the same shall, after a fair trial, fail to establish her claim to unconditional membership in the class for which she was recommended."

Under these conditions, four students only were received on the certificates of two schools, and their probation continued for three months. These four students expressed the opinion that to be subjected to a rigorous examination at the preparatory school, and then be held for three months on probation at college, was a doubtful privilege. These rules have since been modified so as to render admission by this method less difficult.

Wellesley was less exacting towards the certificates proffered it. The written statement of a country high school, in another State, that within two years its students had passed a satisfactory examination in all the required studies, was acceptable. If studies, such as geometry and algebra, had been pursued in the first years of that high-school course, the students reviewed and took an examination in these only, before receiving their certificate. It is not known what per cent. of Wellesley's students at this time were thus admitted. The number of certificates received was undoubtedly large.

At Smith, also, a change had taken place. Of 133 students enrolled that year, 20 per cent. were specials, and a large part of all had been admitted by certificates. The following is one form which received the approval of the College:

"This is to certify that ——— is a graduate of the ——— High School, having pursued a four years' classical course, and that she has maintained a good rank in scholarship and deportment. ——— HEAD MASTER."

This was intended merely as a formal "testimonial of character," and was given as well to every youth taking the Harvard examinations. At Smith, this certificate was received in lieu of an examination in all subjects, even Latin and Greek, save geometry and algebra. Admission on certificates was followed by an eleven-fold increase of students at Smith.

The public too often judges the success of any educational institution by the numbers of its students. The trustees are often business men who realize the relation of the income of a college to the number of its paying students, and are apt to emphasize that source of funds when the need of an extension of its educational facilities is urged upon their attention. The President of ——— himself realizes that "it is possible for the college at any time to greatly increase its income by lowering its standard, and receiving, without regard to qualifications, the large numbers who apply for admission." During the last ten years, the number admitted to all these colleges on certificates has greatly increased, and was larger last year than ever before. At Wellesley, it is reported, 150 certificates were accepted. Vassar still holds the most conservative position.

All these colleges now issue printed forms of certificates. An examination of them discloses how cumbrous the system is, how many exceptions to the rule prevail, how easily the instructor may shirk the responsibility for a student's failure after she has entered college, and how numerous are the opportunities for abuses to creep in. Stated generally, certificates are now accepted from "approved" schools and *individuals*. This approval has been based upon actual experience in educating pupils prepared at the school, or a visit by one or more of the college faculty, the recommendation of a trustee of the college, or a self-appointed committee of alumnæ, or even a "mutual friend." These "visits," it is said, have sometimes proved purely social in their nature. Usually, no limit is placed to the time during which this privilege shall hold good.

Enough has been said to indicate the direction in which the policy of these colleges now tends. The advocates of the certificate system hold that it increases the number of students enjoying the privileges of the college; that it

increases the available income; that it avoids a nervous excitement which necessarily attends entrance examination; that it affords a connection with the public and private secondary schools beneficial alike to school and college; and that, to quote the recent statements of the President of Brown University, "the whole system of depending upon formal examinations is a humbug," and "a certificate of competency from a trustworthy teacher is eminently preferable to these formalities."

The opponents of the certificate scheme hold that the weight of authority is against that system, and point, as examples, to Harvard, Yale, Princeton, Cornell, and Johns Hopkins University; that few students, who are *properly prepared* and accustomed to written examinations, suffer from a nervous dread of the college examinations; that a thorough written examination in the subjects required for admission to college extending over several days accurately gauges a student's knowledge of such elementary subjects, and is distinctly opposed to a success resulting merely from a process of cramming; that a connection with secondary schools which lowers the standard of the college is of questionable value to either school or college.

Moreover, justice to all those students who have faithfully submitted themselves to the college's published requirements, and have presented themselves fully prepared in all subjects, demands that the same standard shall be exacted uniformly from all. A competent instructor meets the level of the average intelligence of his class, and it is manifestly unjust to the best students to increase the natural inequalities of a class by a failure on the part of the college to enforce its own conditions. And surely, it is not the function of college officers to travel about the country passing judgment upon preparatory schools. Nor can the college reasonably expect that those schools will be more efficient in maintaining a standard which the college itself has failed to enforce. While it is not claimed that all students entering on certificates are ill-trained—such an assumption would be absurd—it is held that a larger number of students "not well-grounded in anything" enter the women's colleges every year under the present system, and it is a very delicate matter to dismiss students, when once admitted, who, after a residence of two or three months, are proved to have been, through no fault of their own, insufficiently prepared.

It is time that those who have the true interests of the higher education of women at heart, and who believe in the great advantages which spring from a residence in the cultivated and scholarly atmosphere of the best academical seats of learning, should utter a protest against this baneful system of admission by certificates, and ask that public opinion should demand a return to the honorable position held by Vassar ten years ago. A. Y.

DICKENS IN GENOA.

GENOA, February 23, 1888.

ALTHOUGH Dickens was endowed with quick perceptions and a ready sympathy with whatever he saw, his manner of working was too methodical, and his interest lay too much in England, for him to be greatly affected by his surroundings when in the act of composition, or for his novels to show many traces of his life on the Continent.

We all know the picture of his favorite writing-table at Gadshill, and he could do no work, either at Genoa or Lausanne, or Paris or Boulogne, unless his table were placed in the same way in front of the window, with the same orderly arrangement of paper and pens, knives and weights, and of the cheap and tasteless little ornaments, each one of which had for him some particular meaning. 'Dombey and Son' was begun at Lausanne and finished in Paris; his second Christmas story, 'The Chimes,' was suggested to him by the ringing of the bells at Genoa, the sound of which came up to his windows from every quarter of the town. In the 'Tale of Two Cities,' the scene is laid partly in Paris, and the story was suggested by his residence there. Apart from that, only one incident in 'Dombey and Son,' and a portion of 'Little Dorrit,' seem to contain any references to his journeys on the Continent. 'Martin Chuzzlewit,' of course, sprang from his American trip, and was written with a distinct object; but, unlike the 'American Notes,' the 'Pictures from Italy' did not blossom into a novel.

This book, which is unjustly depreciated by most, but of which the charm for me has not gone after several re-readings, was begun in the form of letters in the first number of the *Daily News*. Delightful as it is, it by no means equals the private letters from which it was made up—at least so far as we can tell from those published by his children, and the extracts given by Forster, who refused to publish anything "resembling his printed books however distantly.". Forster's work is not so much a biography of Dickens, in spite of its title, as an account of Dickens's relations with Forster. This rendered necessary the publication of additional volumes of letters, thereby affording a new pleasure to those who enjoy Dickens's letters more than his novels. In all of them, and especially in those from Italy, Dickens displays not only his power of vivid and picturesque description, but an instantaneous perception, sympathy, and clear-sightedness, which is only occasionally led astray by reflection based on a supposed knowledge, turning out at times to be either insufficient or erroneous.

When, in the winter of 1844, Dickens decided to go to Italy for a year, he had thoughts of Nice, and wrote to Lady Blessington to know "whether this same Nice be a healthy place the year through, whether it be reasonably cheap, pleasant to look at and to live in, and the like." D'Orsay strenuously insisted that there was no place for headquarters like Pisa; but Genoa was finally decided upon, and, by my Lady's advice, it was arranged to take for the summer a villa in the suburb of Albaro (where he arrived with all his family, having driven post from Calais to take a steamer at Marseilles), at an expense altogether of about two hundred pounds. He found out afterwards that he could have had the Villa Doria at Pegli, "a wonderful house, full of the most unaccountable pictures and the most incredible furniture," with a great park and woods, for £40 a year; but a stupid friend had hired for him, at an exorbitant price, a common Italian country-house, badly furnished, although with a lovely view and in the midst of fine vineyards. This was the Villa Buonavista, or, as it was called from the name of the proprietor, Bagnerello, which, from its color and some peculiarity of the courtyard, Dickens nicknamed the Pink Jail. He had hoped to get the villa in which Byron had lived, but that was close to the main road, and had even then been turned into the disreputable wine-shop which it is still.

To get to the Pink Jail it was necessary to go through narrow lanes with sharp turns, and his carriage had first to be measured to see if it could pass, as a few days before the carriage of some grand lady had got stuck, and she had to be pulled through the front window. Even lately, on my first pilgrimage, some well-intentioned persons who met us warned us of the danger, and suggested a different and roundabout road. But the coachman exhorted me to have courage, and brought me safely to the house. The next-door neighbor of Dickens, and one of his great friends, was the French Consul-General, who had married an English lady, and had even written about his earlier novels in a French review. He says: "Their house is next to ours on the right, with vineyards between; but the place is so oddly contrived that one has to go a full mile round to get to their door." This is a pardonable exaggeration, unless old lanes were strangely unnoticed by Dickens, but has been construed as a fact by his biographer, who was never there. A similar statement, which comes only from the fancy of a nervous temperament, is that of his sufferings from the sirocco, in the first week of his stay, described as if he were in the interior of the Sahara; it being a notorious fact that foreigners experience rather pleasant than unpleasant sensations from the sirocco blowing over the sea during their first year in Italy.

It is impossible to refrain from quoting a passage from a letter to Maclise, because, with its exaggerations, it so exactly expresses the effect of summer on the Riviera:

"When the sun sets clearly, then, by Heaven, it is majestic! From any one of eleven windows here, or from a terrace overgrown with grapes, you may behold the broad sea; villas, houses, mountains, forts strewn with rose-leaves, strewn with thorns—stifled in thorns! Dyed through and through and through. For a moment. No more. The sun is impatient and fierce, like every one else in these parts, and goes down headlong. Run to fetch your hat—and it's night. Wink at the right time of black night—and it's morning. Everything is in extremes. There is an insect here (I forget his name, and Fletcher and Roche are both out) that chirps all day. There is one outside the window now. The chirp is very loud—something like a Brobdingnagian grasshopper. The creature is born to chirp—to progress in chirping—to chirp louder, louder, louder—till it gives one tremendous chirp and bursts itself. That is its life and death. Everything is in a concatenation accordingly. The day gets brighter, brighter, brighter, till it's night. The summer gets hotter, hotter, hotter, till it bursts. The fruit gets riper, riper, riper, till it tumbles down and rots."

On the 1st of October Dickens moved into Genoa, where he had an apartment in a palace which even still occupies the finest site in the town. It is that large, stately square house, then called the Palazzo Peschiere, standing high up above the promenade of Acquasola, at that time let in apartments. On a subsequent visit in 1853 Dickens found it occupied as a girls' school; but it is now restored to its original purpose, and is again the residence of a single family. During his winter in Genoa Dickens, of course, walked through every street and alley, and over all the surrounding country, by night as well as by day, though he missed what he saw in his night walks through the London streets, of which he sadly complains; for he was deprived of all that put him into a mood fit for the field of writing which he had chosen. He made an excursion along the Cornice road to Marseilles; found time for a hasty trip to London to read his new Christmas story, 'The Chimes,' to his friends; and was able to make a much more leisurely journey to Florence, Rome, and Naples.

Genoa has greatly changed since Dickens knew it, although he found much that was new on his second visit, and speaks of a new and fine café with gardens, next to the new Municipality, which had ousted pupils and teachers from the Jesuit college—a café which we seem to recognize as the Concordia, the only good

restaurant in northern Italy, except Doney's at Florence, Franconi's at Como, and Quadri's at Venice. Mediterranean and American commerce and the opening of the St. Gothard tunnel have so increased Genoese trade that, with the demolition of the charming old marble promenade and the construction of new moles, quays, and warehouses, even the appearance of the Port is altered. The town stretches now almost to Sestri on one side, and fills up all the valley on the other as far as Albaro. By the side of the Palazzo Peschiere runs the long new Via Assarotti with its great piles of buildings, but a part of the Peschiere Palace gardens still remains. The old gate at the foot of the Acquasola has given place to a fine paved square, with statues of Vittorio Emmanuele and of Mazzini; and the villetta of Dickens's old friend, the Marchese di Negro, is now a public garden and museum.

Dickens gives a very amusing description of the Marchese, whom he calls a "very fat and much older Jerdan, with the same thickness of speech and size of tongue. He was Byron's friend, keeps open house here, writes poetry, improvises, and is a very good old Blunderbore; just the sort of instrument to make an artesian well with anywhere." The quality which so particularly amused and enraged Dickens was the mania of the Marchese for reciting his own verses on all occasions. The description of him, which is far too long to quote, is vivid and on the whole not ill-natured; indeed, one may believe it not exaggerated after seeing the bust of the Marchese now in front of the door. Nevertheless, the little foibles of this gentleman were far more leniently judged by his countrymen, and, if we may believe the letters of Giordani and others, his acquaintance was sought for and appreciated by literary men.

I cannot help copying a passage about the new Governor to whom Dickens had been told he should pay his respects—a ceremony from which he was excused by the tact of the Consul:

"'Where's the great poet?' said the Governor. 'I want to see the great poet.' 'The great poet, your Excellency,' said the Consul, 'is at work writing a book, and begged me to make his excuses.' 'Excuses!' said the Governor, 'I wouldn't interfere with such an occupation for all the world. Pray tell him that my house is open to the honor of his presence when it is perfectly convenient for him, but not otherwise. And let no gentleman,' said the Governor, a-surveyin' his suite with a majestic eye, 'call upon Signor Dickens till he is understood to be disengaged.' And he sent some one with his own cards next day. Now, I do *seriously* call this real politeness and pleasant consideration—not positively American, but still gentlemanly and polished."

Unfortunately, the published letters give us little information as to the real friends Dickens made in Genoa, who welcomed him back so warmly on his visit ten years later. We only know that the last few days of his stay, when the establishment was being broken up, he passed at the Palazzo Rosso above the Vandyke Picture Gallery, as the guest of Mme. Delarue, whose death last year is still deplored.

Of the novels it is only 'Little Dorrit' that shows the influence of Dickens's stay in Italy. The scene in the Monastery on the St. Bernard is, so far as we can tell from the letters, and from a confession in a letter from M. Cerjat, almost a description of his journey with that gentleman and other friends from Lausanne. The little pictures of Italian post stations and country towns, and the sketches of Venice and of life there, are mere reproductions of the author's actual impressions, and could only have been drawn by one who had been on the spot. These bits are so excellent as to counterbalance the many defects of the story. E. S.

Correspondence.

DR. VON HOLST.

To the Editor of The Nation:

Sir: I am much obliged to your correspondent "N. Z." for calling my attention to the article in the *Zeitschrift*. Dr. von Holst is no friend of republican or parliamentary government, as shown not merely in his writings, but by the fact, very rare in my experience with Germans, that, after living some time in this country, he has preferred to return and make his home in Germany.

But as to the particular point, the want of influence other than negative, by the President as to legislation, I do not see that "N. Z." has disproved the argument. What difference does it make in this respect that the President's voice bears any particular proportion to the Congressional vote? Congress passes a measure and the President vetoes or negatives it. Is his veto any more or less negative if it takes sixty-six or twice that number of votes to overcome it? If it required a unanimous vote, how would that give the veto any positive power? Positive power means at least a share in *creating* legislation, which the veto does not and cannot have. "N. Z." says that the President and Cabinet can introduce measures through members of Congress. So can I or any man, and in either case the attention which such bills receive from the committees will depend upon the personal or party gain which the members see in it. On any other ground, a bill presented by the Executive has very little advantage over one from anybody else—in some respects less, on account of the jealousy which Congress as a body always feels towards the other branch.

"The conspicuous instance of the Tariff Bill," instead of upsetting the Professor's theory, seems to me to work just the other way and to confirm it. The country has seldom been stirred by any President's message as by the last of Mr. Cleveland. But the "Mills" bill, which I suppose is the most prominent one, is not identified with the President at all. It may embody his ideas, but I do not believe that one person in ten thousand in this country knows whether it does or not. There is an active campaign in tariff discussion going on in this neighborhood, but, so far as I can learn, it does not turn upon this or any other bill. It deals with the generalities of protection and free trade, and the effect of protection upon wages. Neither has the President endorsed publicly the Mills or any other bill. He has simply uttered some general ideas.

It seems incredible that Congress should allow this session to pass without touching the tariff, and I do not venture to predict that it will. But I always have believed it, and believe it now, on the ground of the tremendous power of the lobby and the want of positive power in the President, unless by underhand intrigue, which I pay him the compliment to believe he will not use. It is this problem which I am watching with intense curiosity, and, if it turns out so, shall have a word to say.

Dr. von Holst says that it is not possible for our Cabinet to take part in the proceedings and debates of Congress without a thorough overhauling and reconstruction of the Constitution. That seems to me the state of mind, not uncommon among foreigners towards this country, of a man who sees somebody having a great many things which he would like, but who comforts himself with the idea that he has exclusive possession of something which the other man would like but cannot have. In the same strain Bagehot says: "The Americans have many excellent things, but this they have not and cannot have." In answer, I will simply refer again to the Senate Report of February 4, 1881, signed unanimously by eight Senators of both parties, which recommends the admission of the Cabinet to seats with the right of debate in both houses; and, after saying that the advantages of this course are too obvious to need discussion, proceeds to demonstrate its entire compatibility with the Constitution as it stands. G. B.

Boston, March 24, 1888.

BOOKS IN THE TARIFF BILL.

To the Editor of The Nation:

Sir: The Tariff Bill submitted by the House Committee is in the main a step in the right direction. But in one respect at least it is only faint-hearted: I mean in regard to books. The bill recommends putting on the free list books printed in foreign languages, but leaves English books subject to a duty of 25 per cent. Why this invidious distinction? Is it tenable in moral, or even in political, law? For years the friends of learning in America have borne the book-tariff with ever-increasing murmurs. And now, when our hopes of a reform seem to be about to be realized, we get *half a loaf!* We are apparently doomed to see the trashiest productions of France and Germany admitted free, and the science, art, history, poetry, and belles-lettres of England still subject to the most degrading tax that ever disgraced civilization.

The House Committee cannot plead ignorance. I have good reason for supposing that a plain and comprehensible statement of facts was laid before them, in three points: first, that the book-tariff was wholly unnecessary to the maintenance of Government; second, that it bore heavily upon those who were least able to bear taxation, viz., the studying class; third, that even from the protectionist point of view it was wholly unnecessary, inasmuch as books were not articles of merchandise in the ordinary sense, and did not compete upon a pecuniary basis. If the Committee were in doubt upon any one of these points, could they not have got further and more explicit information from the real "book-makers" of the country? Why, let me ask again, are French and German books to be free and English to remain taxed? We proclaim to the world that we are afraid of the only nation that speaks our language, that enjoys the same political and religious freedom. We go on saying to every teacher and reader of the grand old English literature: You are a fool, and you shall pay for your folly.

Only one English book is to be duty free, the Bible. That is to say, the only book that is above question of authorship, the only book which *is in competition*. Oxford and Cambridge are to be free to compete with our Bible societies. The idea of competition is not my invention. I merely take it as I find it. But truly it must savor of irony, that the Bible *makers* of England are to be encouraged to crowd out the Bible *makers* of America. Does not this feature partake largely of cant?

Our legislators are occasionally surprised to discover themselves held in slight esteem by the literary classes. They occasionally find out that Representative passes for a joke, and Senator for a byword. The explanation may be learned by whoever seeks for it. In part it is suggested above. M.

Cincinnati, March 19, 1888.

A QUESTION OF INDEBTEDNESS.

To the Editor of The Nation:

Sir: The review of my 'Two Chapters on the Mediæval Guilds of England' in the *Nation* of March 15, contains, by implication, several charges to which I feel bound to reply. These consist in the inferences that my obligations to the works of Gross and Ochenkowski are deeper than I confessed in the preface and footnotes; that my essay is simply a condensation; and that my references were taken from the German works so carefully as even to follow their mistakes.

I should be sorry to underrate my obligations in chapter i to Dr. Gross, and took pains to acknowledge my indebtedness. Not only do I state in the preface that Dr. Gross "deserves all the credit for setting the subject in its proper light," but I make no less than fifteen references in the notes, such as, "Gross was the first to clear up the confusions," "first refuted by Gross," "cf. in general Gross," etc., etc. (pp. 13, 15, 16, 22, 23, 28, 29, 31, 34, 35, 39, 41, 42, 45). At the same time I must protest against the assumption that my chapter is only a condensation, not based on original researches. I may assert with confidence that there is not a single reference to any page or authority which has been taken at second hand, and which has not been carefully scrutinized by me. The review maintains that my arguments, illustrations, and authorities are simply those of Dr. Gross. This again is unfair. Among the arguments adduced by me, but not mentioned by Dr. Gross, are these: The distinction between guild member and burgess, because of admission of prelates (p. 38), and of women (p. 42); the distinction between guild merchant and borough (p. 41); the whole relation between craft guilds and guild merchant (pp. 57-60 and *passim*); the denial of Gross's statement as to the origin of the merchant guild (pp. 16, 17), etc. Among the illustrations not mentioned by Gross, are some on pages 22, note 4; 23, n. 4; 25, n. 1, 2, 3; 27, n. 1; 27, n. 5; 28, n. 3; 31, n. 3; 33, n. 1, 2, 3; 37, n. 5; 38, n. 6; 45, n. 1; 46, n. 6; 47, n. 2; 48, n. 1, 3. Among the authorities not mentioned by Gross, but used by me are: Corry, History of Bristol; Deering, Notinghamia; Historic Documents of Ireland; Palmer, Perlustration of Great Yarmouth; a History of Preston; Reader, History of Reading; Regiam Majestatem; Scaum, Beverlac; Seymour and Marchant's London; Throsby's Leicester; Warden's Dundee; Woodward's Hampshire, etc. That most of the remaining authorities are to be found in Gross is natural. They are the common property of all scholars, and are mentioned, almost without an exception, in the works of Brady, Madox, Thompson, Stubbs, Merewether, and Stephens. It was through these works that I was referred to the sources during the years 1882–83, and it was only when the chapter had been substantially written that Dr. Gross's essay appeared. It is true that my conclusions are mainly identical with his, but in many cases both his and mine are also identical with those of other authors, and in some cases we do not agree. I have yet to learn that any one is precluded from arriving at the same conclusions as his fellow-workers, especially when he makes continual reference to them, or from using any material to which attention has been called repeatedly. Not a single illustration is used by me at second hand. The only instance on which the review depends for a contrary imputation, is that Walworth is printed for Walford in two cases. This is entirely unfair, as in both these cases (pp. 35, 67) there is only a simple general reference to the author's name as Walworth, but without giving any specific reference. Whenever reference is made to any specific page or volume (and this alone can be called a reference to authority), the name is correctly spelled Walford (cf. p. 15) —a point which ought not to have escaped the reviewer's attention. In the light of all these facts, it seemed to me that I was certainly giving Dr. Gross all due credit, and in a sufficiently "unequivocal" manner.

As to chapter ii and Ochenkowski the matter is still plainer. Here I give entire arguments of which no account is to be found in the German work. So the theory as to the origin of the crafts (pp. 50-58, 59, 63); the economic significance of the crafts (p. 75); the error of Ochenkowski in overlooking the municipal influence (pp. 79, *et seq.*), etc. In this chapter there are scores of new points and references unknown to the German work, and yet I expressly state in the preface that the essay "is in harmony with many of [his] conclusions," and refer to him in the notes in most of the important points.

I submit that a work, fragmentary though it may be, which was the result of eighteen months of laborious and detailed research, does not deserve the epithet of a "condensation," and that the assumption of disingenuousness is both unwarrantable and unjust.—Truly yours,

Edwin R. A. Seligman.

New York, March 23, 1888.

A FAMILIAR QUOTATION TRACED.

To the Editor of The Nation:

Sir: In No. 1186 of the *Nation*, page 243, in your interesting review of 'Bracton's Note Book,' occur these words:

"As regards one of the Latin phrases quoted in this passage—when Bracton says, 'licet nihil certius sit morte, nihil tamen incertius est hora mortis,' and the annotator says, 'nihil certius morte, nihil incertius hora mortis,' the suspicion arises that both may be using some familiar quotation or commonplace; and Mr. Maitland does not overlook this.

'Mors incertarum rerum certissima cunctis,
Incertum quando, certum aliquando mori';

so run certain seemingly monkish lines of unknown origin," etc.

Then, after a quotation from Chaucer, the review proceeds: "Perhaps the 'nihil certius morte' will hardly be found in any classical author."

I do not know where these exact words may be found in a classical author, but is not this familiar passage from Cicero (Cato Maior, sec. 74), sufficiently near in sentiment and phrase to be the source, possibly, of the commonplace: "Moriendum enim certe est, et incertum an hoc ipso die. Mortem igitur omnibus horis impendentem timens, qui poterit animo consistere"? Seneca in several passages expresses a like sentiment. In Ep. 30 are these words: "hora illa inevitabilis"; in Ep. 26: "Incertum est quo te loco mors exspectet: itaque tu illam omni loco exspecta"; in Consolat. ad Marciam, 10: "Nihil de hodierna die promittitur, . . . nihil de hac hora. Festinandum est, instat a tergo mors"; again, *ibid.*: "Nos oportet in promptu habere, quæ in incertum diem data sunt." In another passage from the Epistles, quoted by Aldus Manutius, which at this moment I cannot verify, Seneca says, "In tanta volutatione rerum humanarum, nihil cuiquam, nisi mors, certum," which is not greatly different from the passage from Bracton.

The quotation from Cicero is so near at hand that I have hesitated to call attention to it, but possibly it may prove serviceable to some one.

I am, respectfully yours,

William Carey Poland.

Brown University, Providence, R. I., March 23.

DR. JOHNSON'S ATTIC BULL.

To the Editor of The Nation:

Sir: The first time I heard Dr. Johnson's famous definitions of "attic" and "garret" referred to, it was in a lecture given in my boyhood, in a New York village, by a professor from Hamilton College. Having access later to a first edition of the noted Dictionary, I speedily turned to the above words to see how the Johnsonese looked, but I looked in vain for "attic." It is not in the book. Miss Isabel Hapgood's reference, in the last *Nation*, to the words prompts me to state that the definition sought for may be found after "cockloft," thus: "The room over the garret, in which fowls are supposed to roost, unless it be rather corrupted from *coploft*, the *cop* or *top* of the house." Garret is defined, "A room on the highest floor in the house." The Doctor's quotation from Swift implies that his versions of the words were common in his day: "My garrets, or rather my *cocklofts*, indeed are very indifferently furnished; but they are rooms to lay lumber in."

Again, Dryden, translating Juvenal, says:

"If the lowest floors already burn,
Cocklofts and garrets soon will take their turn."

As used in these extracts, the words do not seem unreasonable, and a careful reading of the definitions fails to discover the ridiculous features so often ascribed to them.

Alfred S. Roe.

Worcester, Mass., March 23, 1888.

Notes.

Still another life of the Emperor William I. is announced, by Belford, Clarke & Co. The author is Gen. Hermann Lieb.

Ticknor & Co., Boston, publish immediately 'Agatha Page: A Parable,' by Isaac Henderson, and 'Isidra,' a Mexican novel by Willis Steell. Later in the season they will issue 'The Pilgrim Republic,' an historical review of the Colony of New Plymouth, by John A. Goodwin; 'Felix Mendelssohn's Letters to Ignaz and Charlotte Moscheles,' translated and edited by Felix Moscheles; 'Homestead Highways,' by Herbert M. Sylvester; 'Sketches Abroad,' by J. A. Schweinfurth, architect; 'Along the Shore,' poems by Rose Hawthorne Lathrop; 'The Ethics of Boxing and Manly Sport,' by John Boyle O'Reilly; and the following novels: 'Olivia Delaplaine,' by Edgar Fawcett; 'An Uncloseted Skeleton,' by Lucretia P. Hale and Edwin Lassetter Bynner; 'A Mexican Girl,' by Frederick Thickstun; and 'Len Gansett,' by Opie P. Read.

A. C. McClurg & Co., Chicago, announce 'His Broken Sword,' a novel, by Miss Winnie L. Taylor.

Prof. A. Melville Bell means to demonstrate the fitness of English for adoption as the universal language, in a work, 'World-English,' to be shortly issued in this city by N. D. C. Hodges. It involves an amended alphabet for phonetic spelling.

'Voltaire's Prose,' edited for schools by Adolphe Cohn; 'Selections from Boccaccio's Decamerone,' by Prof. A. Marshall Elliott; and 'Meissner's Children's Own German Book,' adapted for American use by Prof. Edward S. Joynes, are among D. C. Heath & Co.'s announcements in modern languages.

Dr. F. Holthausen is preparing for the "Sammlung kurzer Grammatiken germanischer Dialekte," edited by Braune and published by Niemeyer, a grammar of modern English.

Prof. Cappeller of Jena has in preparation an English edition of his Sanskrit dictionary, the German edition of which was completed in the summer of 1887. It will contain all the words found in those texts which are generally read during the first two or three years of a Sanskrit course. It is based upon the St. Petersburg dictionary, but has the great advantage over Böhtlingk's 'Kurzgefasstes [3 vols. !] Wörterbuch' that it is complete in one handy volume.

All students of syntax as well as all students of Sanskrit will be gratified to learn that Prof. Delbrück's (Jena) Vedic Syntax, a work to which he has exclusively devoted himself for the past six years, is shortly to appear from the press of the Buchhandlung des Waisenhauses (Halle).

The Clarendon Press will, on a guarantee of fifty guineas in sums of two guineas, reproduce by the Collotype process a series of at least ten large maps of properties in Oxfordshire belonging to some of the colleges, and all dating from the beginning of the seventeenth century. They illustrate not only the open-field system, but the topography of the country. Subscriptions may be sent to Mr. Mowat, Pembroke College, Oxford. Should there be fifty, the pledge will be reduced one-half.

Prizes of $500 and $200 are offered by Mr. Henry Lomb of Rochester, N. Y., through the American Public Health Association, for the two best essays on "Practical, Sanitary, and Economic Cooking adapted to Persons of Moderate and Small Means." They must be sent to Dr. Irving A. Watson, Concord, N. H., on or before September 15, 1888, with the writer's name in a sealed envelope. Dr. Watson, who is the Secretary of the Association, can supply copies of four previous prize essays elicited by Mr. Lomb, on "Healthy Homes and Foods for the Working Classes," by Prof. Victor C. Vaughan; "The Sanitary Conditions and Necessities of School-houses and School Life," by Dr. D. F. Lincoln; "Disinfection," by Dr. Geo. M. Sternberg; and "The Preventable Causes of Disease, Injury, and Death in American Manufactories," etc., by Geo. H. Ireland.

Mr. W. F. Taylor is editing for publication the marginal notes writen by Coleridge in the books owned or borrowed by him. A limited issue in quarto form, with three portrait illustrations, will be made to subscribers by David Nutt, London.

The Publication Agency of the Johns Hopkins University has made a tasteful pamphlet of the proceedings at the unveiling of the bust of Sidney Lanier on February 3. It contains poems, papers, and letters, and a bibliography, and lacks only a portrait, or a view of the bust, to be a complete summary of the occasion. Two copies will be sold for one dollar.

Mr. Benj. R. Tucker of Boston has undertaken the translation, publication, and sale of the complete works of J. P. Proudhon, which are expected to comprise about fifty volumes. Volume first has already appeared, and volume fourth—'System of Economical Contradictions'—is now before us. Since Mr. Tucker has decided that the work was worth doing at all, we can only say that, so far as the translation and publication are concerned, he seems to have thought that it was worth doing well.

The first volume of a new series, "Twelve English Statesmen," published by Macmillan & Co., has just appeared. The series aims "to present in historic order the lives and work of those leading actors in our affairs who, by their direct influence, have left an abiding mark on the policy, the institutions, and the position of Great Britain among States," and "is intended to form a continuous narrative of English freedom, order, and power." The illustrious twelve are William the Conqueror, Henry II., Edward I., Henry VII., Wolsey, Elizabeth, Oliver Cromwell, William III., Walpole, Chatham, Pitt, and Peel. Among the contributors to the series are E. A. Freeman, F. York Powell, M. Creighton, Frederick Harrison, and John Morley. 'William the Conqueror,' by Edward A. Freeman, is the first of the twelve monthly instalments. In comparing his 'Short History of the Norman Conquest' with this new work, the author says (p. v): "That was a narrative of events reaching over a considerable period of time. This is the portrait of a man in his personal character, a man whose life takes up only a part of the time treated of in the other work." It is almost unnecessary to state that no one was better fitted than Freeman to write this biography, and that the series opens most auspiciously.

Two new volumes have been added to the series "English History from Contemporary Writers," viz.: 'Strongbow's Conquest of Ireland,' 1166-1188, by Francis P. Barnard; and 'Simon de Montfort and his Cause,' 1251-1266, by Rev. W. H. Hutton (London: D. Nutt; New York: Putnams). The former "tells the story of the first contact between the newly organized feudalism of Anglo-Norman England and the far older and primitive civilization of the last independent Keltic States." Mr. Hutton's 'Simon de Montfort' is more ably compiled than his other work in the same series, 'The Misrule of Henry III.' He conveys a wrong impression when he states, on p. 47, that Henry III. sold the Jews of England to Earl Richard of Cornwall. In reality, the revenues accruing from the Jews were temporarily assigned or mortgaged to the Earl, in order that, as Matthew Paris tells us, "he might eviscerate those whom the King had excoriated." The royal revenues from important towns such as Bristol and Exeter were often transferred in a similar way. Mr. Barnard's and Mr. Hutton's volumes are both excellent contributions to the series; they will aid in bringing the public in closer touch with the periods of which they treat.

The second volume of the Henry Irving Shakspere (Scribner & Welford) contains the second and third parts of "Henry VI.," "The Taming of the Shrew," "Midsummer Night's Dream," and "Richard II." The general plan of the work we have already spoken of. The special features of this volume are the condensation of "Henry VI." made by Charles Kemble and printed from his MS., in Henry Irving's possession, and the citation of the Egerton MS. "Richard II.," an acting play later than Shakspere (c. 1630) of which Halliwell-Phillipps once printed eleven copies. To Kemble's condensation we may recur hereafter. The work of the editor is very well done, as in the previous volume.

Mr. Lewis Sergeant's new 'Government Year Book' (London: Unwin; New York: White & Allen) explains itself as "a record of the forms and methods of government in Great Britain, her colonies, and foreign countries," and justly claims for itself a certain originality. Its scheme may be said to be comparative and philosophical rather than statistical. The more or less fixed portions analyze the constitutions (in the largest sense) of the several countries, quoting nearly in full the charter of the United States and the French Republic's organic law of July, 1875. The renewable portions are reviews of political events of the previous year (1887), so far as these bear on inner questions of state, or international relations. We cannot say that we think the editor quite qualified for his task, either by lucidity and condensation of style or by intellectual grasp. Still, the execution is respectable and may be improved. We remark convenient lists of treaties and other international conventions since 1815 (the number of which is increasing most significantly), and of the principal British Cabinet Ministers from 1869 to 1888; and a tabular view of the forms of government in the world. A queer sentence on p. 300 is worth quoting (italics ours): "The Civil War between the North and South in 1861-65 not only brought about the emancipation of the slaves, but also confirmed the claim of the Union to prevent by force the secession of particular States. *In this not very satisfactory manner* the greatest of the federal republics dealt with the most formidable of the dangers which beset the path of every federation."

From Cupples & Hurd, Boston, we receive a fresh edition of Mr. W. H. Whitmore's incomparably ingenious and compact 'Ancestral Tablets'—a collection of diagrams for pedigrees, "so arranged that eight generations of the ancestors of any person may be recorded in a connected and simple form"; and W. P. W. Phillimore's 'How to Write the History of a Family,' of which we shall have something to say hereafter.

In the fourth volume of the *Forum* the labor question, in one form or another, asserts its supreme interest. "What is the Object of Life?" was also a concern to several writers, and more yet had to tell of "Books That Have Helped Me." In this last series the permanent value appears to us to lie far more in the autobiography than in the spiritual experience related. The rest of the table of contents shows the usual range of political, literary, and ethical discussion.

The *Universal Review*, a monthly periodical having an international character, is announced to be launched in England in May.

Mr. Hamerton resumes, in the March *Portfolio* (Macmillan), his dialogue over "Book Illustration," beginning with the question of its utility. The "Scientist" upholds it in imaginative literature as a stimulus to the reader's imagination. If the artist falls short of the author, so does the unaided reader. "It is quite a mistake to suppose that when you read 'The Newcomes,' you see in your mind's eye exactly the Colonel Newcome that Thackeray saw. Doyle's conception of the Colonel is not Thackeray's either; but it may be more vivid and more consistent than your own." The "Critic" (Mr. Hamerton) reports that "Anthony Trollope was extremely pleased with Millais's illustrations to his novels," and George Eliot no less with Leighton's to 'Romola,' especially his conception of Tito, "one of her favorite creations." Dickens said of Seymour that he made Mr. Pickwick a reality, and Thackeray used to praise Frederick Walker. Mr. Hamerton takes the surprising ground that "the use of illustrating 'Gulliver's Travels' is very questionable," and so with 'Robinson Crusoe.' He is quite right in wishing to exclude from histories composed pictures of events which the artist could not witness, and in his enumeration of the kinds that are admissible.

A paper on Francesco del Cossa, with illustrations of his works, and a paper on Alexander Dumas, senior, as a dramatist, compose the main text of *L'Art* for February 15 (Macmillan). The full-page etching is a portrait of Baron James de Rothschild.

The *Journal of the Military Service Institution* for the first quarter of 1888, No. 33, is perhaps the most valuable issue up to this time. It contains the prize essay upon "Our Northern Frontier," by Lieut. Woodruff, Fifth Infantry; "How to Feed the Soldier," a most interesting paper by Major Spurgin, the popular Commis-

sary of Cadets at the Military Academy, etc.; "Systems of Defence of the Principal Powers of Europe," by Capt. Turtle, U. S. Engineers. But the most timely and valuable paper in the *Journal* is part i. of Lieut. R. W. Young's "Legal and Tactical Considerations Affecting the Employment of the Military in the Suppression of Mobs," etc. The data for this work were compiled while General Hancock was President of the Institution, and at his instance, and the manuscript has been examined at the invitation of the Institution by General F. J. Porter, Commissioner of Police, General Josiah Porter, Adjutant-General of New York, and General E. L. Molineux, an authority upon the subject, and has met their approval. It cannot fail to be of value to officers of the regular service and of the National Guard. The *Journal* closes with an exhaustive discussion of a lecture recently delivered by Captain Birnie, Ordnance Corps, upon "Gun-making in the United States." Fifteen experts (civil and military) in the invention, construction, or use of heavy ordnance, including some of the most famous iron founders in the country, took part in this discussion.

Prof. Milne of Tokio continues research, with his accustomed activity, in the phenomena and causes of earthquakes, earth tremors, and the like. In vol. xi. of the Transactions of the Seismological Society of Japan — the latest which has reached us—he follows up a line of investigation which he began five years ago, and in which he seeks to make out the theory of the influence of the wind and barometric changes upon the earth's crust. After treating of late researches on earth tremors by Italian seismologists, Prof. Milne discusses the observations made up to the present time in Japan, and concludes that nearly all these tremors are traceable to the effects of the wind upon the earth's surface, and that these slight motions of the crust are frequently propagated to regions far removed from the immediate area of wind disturbance. More specifically, the earth tremors coincide with a low barometer more often than with a high one; a high barometric gradient is more favorable to their detection than a small one; the stronger the wind the more likely are the earth tremors to be observed; earthquakes and earth-tremors appear to have no connection, other than that both occur during the same seasons with greater frequency; and, lastly, the tremors, quite different from earthquake effects, are fully as severely felt on the summits of mountains as on the plains below. From the evidence exhibited in Prof. Milne's paper, the conclusion appears to be well established.

Professor Winslow Upton, Secretary of the New England Meteorological Society, Providence, R. I., has distributed a circular to some five hundred towns in western New England, asking for records of the average depth of snowfall in the recent severe storm, with which to supplement the 150 reports that will be received from the regular observers of the Society, and thus gain material for a discussion such as the storm warrants. The newspapers have been so occupied with the effects of the snow-drifts, that the storm as a whole has gone almost undescribed; there has been no adequate account of it yet published. The signal-service stations are too scattered to furnish the data needed for a detailed statement of its approach and passage, although its extraordinary character entitles it to careful study. At such times, especially, the value of the local State weather services is particularly apparent, and it is to be regretted that New York has not followed the example of all the adjacent States in organizing one. There was a time, some forty years ago, when New York led the country in the fulness and accuracy of her climatic records, but now she stands at the other end of the list, behind Louisiana and Arkansas in this respect. We can hardly expect the desired increase in the accuracy of the official weather predictions until fuller material for the study of storms that are predicted incorrectly is gathered and discussed in a thorough manner.

The first paper in the March Proceedings of the Royal Geographical Society is on Siam, by J. McCarthy, Superintendent of Surveys in that country. Referring to the proposed Indo-Chinese Railway, he expresses strong doubts as to the commercial success of the enterprise. In one of his journeys in the northeastern part of the kingdom, he found some gigantic stone jars in a great plain, the former use of which is unknown to the natives, but which remind us of the burial jars of ancient Peru. Admiral Mayne gives a summary of explorations in British North Borneo, and Gen. Strachey contributes his first lecture on geography before the University of Cambridge, in which he treats of the relations of geography and astronomy, and sketches the history of the construction of maps.

At the February meeting of the Berlin Geographical Society, Dr. Wiedermann, who had just returned from central Asia, gave an account of the Trans-Caspian Railway. Besides its strategical importance, in his opinion it possesses an eminent economic value. Already the country through which it passes is becoming rapidly settled and cultivated. Of the various productions, "cotton is destined to play the most important part, since the cultivation of American cotton has been commenced with the greatest success in the neighborhood of Tashkend and Samarkand; in the former place in 1887 three full crops were produced from one field. The total area of cotton plantations in Turkistan is estimated at 600 desiatines, or about 1,500 acres, and will soon render Russia independent of foreign countries as regards cotton."

Since Mr. Im Thum succeeded in gaining the summit of Mt. Roraima in Guiana, two other botanists have made the ascent. One of them, Mr. F. Dressel, saw some butterflies, nearly black, on the top, as well as a small black toad and a millipede. It had been supposed that there was no animal life upon the mountain.

Apropos of Mr. Fitzedward Hall's recent remarks in these columns on "most" in the sense of "almost," "C." writes us as follows: "This use of the word is a tradition from very far back, and whether, as a habit, confined to the ignorant of our day or not, did not originate among the ignorant. In King Alfred's Orosius we read that Cyrus had laid waste 'most all' the East (mæst ealne); and in Archbishop Wulfstan's homily mæst ælc, most everybody, occurs twice."

—The April *Harper's* contains a paper upon "Acting and Authors," by C. Coquelin, supplementary to the one which he contributed some time ago, and somewhat more special in its manner of treatment. It is noticeable for the strong ground he takes, that the actor is generally subordinate to the author, and should limit himself with much strictness to interpreting the characters and the words according to the author's conceptions. This involves as a consequence the position that some actors are especially fitted by temperament to certain authors, and, even when one is capable of taking many parts, the necessity of his keeping the types distinct so as not to "Shaksperianize" Molière, and vice versa. His general theory of art is admirably and tersely stated in his remark that "everything ought to start from *truth*, everything ought to tend towards the *ideal*"; and it exhibits the relation between the two rival schools, and the truth in each of them, very plainly. The cuts are all interesting, but those which represent Sardou at the rehearsal are particularly effective. Mr. Warner contributes a second paper on the West, which is, if anything, even better than that which we noticed last month for its breadth of view, its temperateness, and the reality of the information it affords. He deals especially with Wisconsin, and calls particular attention to the utility and practical influence of the farmers' institutes there, and to the establishment of county hospitals for the chronic insane, with their methods of freedom and labor, which he regards as a real and beneficial change in the system of State supervision. The West is also represented by an account of the city of Columbus, with a very good description of its business. The foreign-travel paper is an artist's sketch of Algiers, with many illustrations, and it is tolerably successful, though naturally much confined to the artistic point of view. Prof. Griffis's brief description of Japanese ivory carving is also embellished with interesting cuts, and the paper upon the Leavenworth military school is noticeable. There is, as usual, a preponderance of Southern fiction, Lafcadio Hearn contributing a long tale, and Joel Chandler Harris a short one.

—In the April *Atlantic* Mr. Lowell and Mr. Aldrich have poems, and the three serials make much progress. The most vivacious article is by Mrs. Elizabeth Robins Pennell. It is made up of two parts somewhat confusedly intermingled. One is a theory of art, the other consists of some observations of her own upon the London exhibitions given for the benefit of the working-people, with the hope of helping to impart to them some knowledge of cultivated pleasures and arousing in them the instinct for beauty. The theory of art is sufficiently described by saying that it is the denial of Ruskin *in toto*, and with some sharpness, and more particularly that it is an unfavorable criticism of Burne Jones and others of the idealist school. This last is enforced by the opinion on the pictures of the Romanticists spoken by the workingmen for whose benefit they were exhibited. Naturally Mrs. Pennell found that pictures that told some story were the most popular, and that the intellectual or mythical allegorizing of Burne Jones was not understood. The article is not convincing, but it is written with an interest that enlivens it, and it offers a direct view of the process of a noteworthy experiment. Mr. Cook concludes his survey of the Marriage-Contract, to which we have before called special attention, by a summary of the law in the United States. He has no good opinion of that law, and thinks that it places us in the rear of European nations, and even in some respects of savage tribes. The theory that marriage is a personal right has been carried to the extreme here, and in by far the greater part of the country the courts acknowledge the consent of the parties, without any other element whatever, to constitute the bond. He points out the defects of such a theory, with regard to the real interests of society in the institution, and he argues strongly that it constitutes a danger in view of the character of the negro, foreign, and city population over which the law, as so decided, largely rules. He seems to think that ignorance that valid marriage can be constituted in so simple a way may account for the little injury thus far suffered; but with the disappearance of the ignorance we may look for an increase of incon-

venience. The argument and the facts are well worthy of attention.

—*Scribner's* artistic article this month contains many fine cuts of Greek vases, which must prove very welcome to the many who are interested in art of this kind, but to whom such reproductions are not easily accessible. The text is by Mr. Longfellow, and is closely confined to the subject, which it unfolds with special reference to questions of style and taste. Mr. Ropes concludes the sketch of Waterloo, and gives a very definite solution of Napoleon's losing a battle which it would seem from this account belonged to him, had he taken proper care, so far as position was concerned. Gibraltar is the subject of an unusually interesting paper of travel by the Rev. Henry M. Field, and the excellent illustrations give the appearance of the great rock from many points of view with admirable truth. The most notable article in popular interest is Gen. Greely's analysis of the atmospheric conditions of the country with reference to the choice of summer resorts. He recommends, as "moderately dry and not too warm a climate," the coast and islands of Maine and the southern coast of New England between Nantucket and Stonington. Long Island and the New Jersey beaches he regards as less desirable than the Lake region. For a very dry climate, not too hot in summer, he selects the White, Green, and Adirondack Mountains, and the country between the Blue Ridge and the Kanawha Ridge, Cumberland and Clinch Mountains. For comfortable bathing, one should go south of the mouth of Long Island Sound. To get rid of the hottest weather, vacations should be taken not later than the 10th of July. Travel or residence in the Rocky Mountains and westward is discouraged in July and August. No portion of the Pacific States is recommended for summer visitors "except a narrow strip along the coast or on the salt-water bays," which the sea breezes visit. Gen. Greely gives two maps by which one can see the lines of average temperature and of humidity, both of which are interesting for their irregular curves, especially in the Blue Ridge region.

—Mr. George Saintsbury, who has recently employed himself with saying the best word for several of the minor writers of the earlier part of the century, devotes a paper in the March *Macmillan's* to Thomas Moore, in whose songs he still finds living poetry. He does not make a convincing argument; and, in fact, only appeals to the direct impression made by Moore's songs. This is, for the critic, to stand aside and leave the poems to make their own way, and doubtless Moore will affect the sensibilities of a certain class so long as he can get himself read. In the course of the review, nowever, Mr. Saintsbury makes some very true remarks about setting poems to music. Shelley, for example, though our greatest lyrist since the Elizabethans, had no ear for music, and the melody of his poetry is not that of song to be sung. The poems of Shelley have not been successfully set to music, according to Mr. Saintsbury, and even if they had been more skilfully treated, the melody of the notes would still be essentially different from that of the syllables. Burns and Scott, who also had no ear for music, are instances on the other side, because their songs are easily put into musical form. In Moore's case, however, the words and the music go together with such ease that "it never seems to have mattered to him whether he wrote the words for the air or altered the air to suit the words." The question raised is an obscure one. Shelley certainly was very sensitive to music, whether he had an ear for it, technically speaking, or not; the assertion that he was deficient is Peacock's, whose testimony is not the best on anything relating to Shelley. For Burns and Scott, we take Mr. Saintsbury's word, though it would be desirable to know just how much he means by an "ear for music." Independent of this, there does appear to be a music of poetry in itself, distinct from the music of song; and one may be a master of the former without having any but a rudimentary sense of the latter. It is not quite clear that Moore, by uniting the two, rises to any extraordinary height merely by so doing. It is an interesting fact, however, that his name should still be so much alive as to draw forth a biography from a Frenchman, M. Gustave Vallat, which is the occasion of this article.

—Dr. Garnett, in a lecture before the Shelley Society upon "Shelley and Lord Beaconsfield," has brought to public notice the curious but not surprising fact that the latter, in his novel, 'Venetia,' drew Shelley's character out of his own mouth by the easiest of methods. Speaking of the conversation between Herbert (Byron) and Cadurcis (Shelley), Dr. Garnett says: "The most striking passages—with a freedom which would have justly subjected Disraeli to the imputation of plagiarism if he had not put them into the mouth of Shelley himself—are taken out of one of the least known of his works." Much of it is derived from the 'Discourse on the Manners of the Ancients,' apparently from the fragment given by Medwin in 1833, as the whole text did not appear until three years after 'Venetia.' Besides Medwin, Disraeli may have drawn from his servant, Tita, who was formerly Byron's, and was at Lerici with Shelley, and also from Hogg through Bulwer Lytton, and possibly directly from Trelawny. Dr. Garnett points out that in the novel the situation of Cadurcis is from Byron's life, and only the character is Shelleyan. This character, as Disraeli presents it, "is drawn in conformity with the most orthodox Shelleyan tradition precisely as Mrs. Shelley and Trelawny and Hogg and Medwin have agreed to represent the poet." This shows that Disraeli must have taken pains to learn about him. But that Disraeli was strongly attracted by Shelley two years before he began to write 'Venetia,' is proved by his forgotten 'Revolutionary Epic,' which, as Dr. Garnett observes, "bears its obligations to Shelley blazoned upon its front." It is a most palpable copy in style and structure and the very quality of its words. This was in 1834. The date is worthy of notice. Dr. Garnett sees in the 'Epic' and in 'Venetia' proofs of the genuine interest inspired in Disraeli by Shelley; and respecting the verdict rendered in the novel, he says: "So clear a deliverance from a person of Lord Beaconsfield's eminence conspicuously marks a stage in the history of public opinion respecting Shelley. If far from coming up to the claims justly advanced on Shelley's behalf by the members of his own circle, or the author of 'Pauline' [1832], or the young enthusiasts who had taken him up at Cambridge [1829], it is as great an advance on the condescension of Moore as that was on the verdict of the *Quarterly Review*." The episode is an interesting one, which thus connects two such exceptional Englishmen, the most exceptional, indeed, in our century. Dr. Garnett thinks that Theodora in 'Lothair' would have been Shelley's favorite heroine; but this is speculating about a past taste.

—Prof. C. A. Buchheim, already well known to many of our pedagogic readers, has just published (Oxford: Clarendon Press; New York: Macmillan) a volume of selections from Becker's 'Weltgeschichte' illustrating the life of Frederick the Great. Nothing could be more admirably planned, so it seems to us, than this little volume. An English introduction of twenty pages sketches the rise of the Hohenzollern dynasty. The extracts from Becker, one hundred and eleven pages, illustrate the successive periods of Frederick's life, prominence being given of course to the Seven Years' War. The notes, in fifty-six pages, explain difficulties in grammar and structure and (chiefly) in the historical and geographical statements. There is a map of the territory in contention between Austria and Prussia, and an alphabetical index of persons and place-names. Evidently the editor has had in mind students not far advanced and wishing to familiarize themselves thoroughly with German narrative prose. To such, Becker's style, clear, straightforward, free from rhetorical contortion, is perfectly adapted. The editor has done all in his power to make an intensely interesting epoch of modern history attractive and intelligible to the beginner in history and language. And for this he merits the thanks of all his English-speaking colleagues.

—Seldom have excavations on Greek soil rendered more speedy and brilliant results than have those which are now conducted at Icaria by the American School of Classical Studies at Athens, as described at length in the last number of the *Nation*. The work has been like the opening of a great chest of hidden and forgotten treasures. Within six weeks from the beginning of the work, although only half-a-dozen men were employed at first, a museum of antiquities has been formed, besides the determination of an important site. Within the last week, news has come of the discovery of the Pythion, or temple of Apollo at Icaria, with a pretty relief representing Apollo with long curls seated on the *omphalos*, holding up a handful of twigs in one hand, and a patera in the other. Behind him stands a woman, while in front is an altar with an adorant. Another relief represents Apollo playing on the lyre. Not far away, a large platform of marble has been found, a marble seat, some bases; and two walls, one of which makes a curve as if it might enclose the dancing-ground of a theatre. Several other foundations have been uncovered by the trial trenches which have been dug. The field for operations has widened indefinitely, and the thorough examination of the site is a much greater undertaking than was at first supposed. Another ruin in the same valley invites excavation and exploration. Icaria has been treated as at least half mythical; but the deme steps forward now with greater distinctness than any other rural district of Attica.

—'Mounds [*kurgani*] and Occasional Archæological Finds near the Hamlet of Smyela' is the title of a diary kept, during the space of five years, by Count Alexei Bobrinsky, and now published. Between 1879 and 1885 Count Bobrinsky investigated fifty-three mounds in the vicinity of Smyela, in the southern part of the Government of Kieff. These excavations were chiefly conducted by sinking shafts which were sometimes thirty-two feet in diameter, through the centre of the mound, from its summit to its very bottom. Everything that was met with was carefully noted, as well as its position in the mound. In most cases it proved that the lofty mounds had served as the burial place for two different tribes, separated from each other by a great period of time and a noticeable difference in culture. The first inhabitants of the place dug a grave for their dead, covered it with a wooden framework, and heaped above it a lofty, pointed hillock,

Three or four graves, generally of the same epoch, were apt to be found under one mound. In them lay people with remarkably long skulls. As a rule, there were no objects pertaining to daily life lying around them; sometimes flint arrows and knives, or lumps of pigment for tattooing, were encountered. Occasionally the bones of the mole and other small rodents were found. The succeeding race made use of the mounds, burying their dead on top of the first. The skulls of these skeletons are of a form entirely different from those of their predecessors, and in their graves objects of bronze and bits of clay vessels are met with; all of which point to a different nationality for the races. Quite another race was revealed by the examination of one of a throng of low mounds, huddled together to the number of several hundred. This people had bronze and iron implements, held intercourse with the Greeks of the seacoast colonies, and did not place the bones of moles and so forth in their graves, like the two previous tribes. Bits of colored stuffs still lay on some of the skeletons, fragments of galloons, and even brass knee-caps, such as were used by the Greeks. Count Bobrinsky makes the suggestion that these graves may have belonged to a certain tribe, of Greek extraction, whom Herodotus mentions as having lived amid the Scythians, in the interior of Russia. However, the author considers his data insufficient for the construction of any theory, and confines himself to a very careful and minute description of everything found, and its situation, with the aid of two maps and twenty-four plates.

RUSKIN'S PRÆTERITA.

Præterita: Outlines of Scenes and Thoughts, perhaps Worthy of Memory, in my Past Life. By John Ruskin, LL.D. 2 vols. 1886-1887. John Wiley & Sons.

At one point in this story Mr. Ruskin, speaking of himself when just past his majority, asks the reader, "Does he think me a lucky or an unlucky youth, I wonder? commendable on the whole and exemplary, or the reverse?" It is not easy to reply. He himself says that the real fact was "that hitherto, and for a year or two on yet, I was simply a little floppy and soppy tadpole—little more than a stomach with a tail to it, flattening and wriggling itself up the crystal ripples and in the pure sands of the springhead of youth." The autobiography, at all events, describes the tadpole stage of existence, professing to record only the formative years of the author's life; and naturally it is a history of his home, with his near relatives for its leading characters, and the things of childhood and youth for incidents. We shall endeavor to give some account of it, and leave the reader to judge whether Ruskin's education was enviable, and he himself a model boy after any conceivable pattern of perfection.

His mother was the daughter of the landlady of the old King's Head at Croydon, and after attending at a day-school where she became the best needlewoman and otherwise first pupil, being also trained to good housewifery, she went to Scotland to keep house for her uncle and aunt, and commended herself to the son of the family, her cousin, four years her junior; when he started for London seven years later, the two were engaged. Nine years of waiting followed on this, and then Mr. Ruskin, having established himself in the wine business and paid his father's debts, married her. He chose his wife, says his son, "with the same kind of serenity and decision with which afterwards he chose his clerks." Elsewhere we are told that he chose his clerks for their "incapacity," not liking to be excelled himself; but this is not to be used as a comment on his selection of a wife. The ceremony was speedily and almost secretly performed, and the two entered upon a life which continued to be very quiet.

Ruskin was the only child of this late union, and when his memory begins, his mother must have passed her fortieth year. He was destined from the cradle, in the hope of his parents, to be a bishop, and perhaps this may have had something to do with the severity of his religious education. He was taught, first and last, the Bible; his mother read it with him daily until he was fourteen, with much attention to his utterance and also to the meaning; nothing was omitted; in this way "she began with the first verse of Genesis, and went straight through, to the last verse of the Apocalypse; hard names, Numbers, Levitical law, and all; and began again at Genesis the next day." He had also much to commit to memory, and he used to write out abstracts of sermons that he heard. No playthings to speak of were allowed him; a set of blocks and an architectural bridge seem to have been all. He was whipped on all proper occasions, and so learned to be quiet and obedient and not to tumble down stairs. He was not allowed to do anything in which he might meet with an accident, and had none of the sports of boys; in fact, he never had any real association with boys. He learned his lessons and played as he could, and he had a place in the drawing-room at tea, a "cup of milk and slice of bread-and-butter in a little recess, with a table in front of it, wholly sacred to me; and in which I remained in the evenings as an idol in a niche, while my mother knitted, and my father read to her—and to me, so far as I chose to listen." His appetite was not cloyed with sweets nor his digestion ruined with desserts; he actually remembers his first taste of custard as an event. The servants were allowed to do nothing for him except what it was their duty to do. In short, he was most beautifully taken care of according to his mother's idea of what was proper.

He himself notices some few of the consequences. In the first place, he says, he had nothing to love, and so grew up without affection, his father and mother being like powers of nature to him; and he had also nothing to endure, no independent exercise of his perceptions of right and wrong or other training in any school of self-control, no education in social manners. These defects he afterwards perceived, but to what extent is uncertain. At the end of the volumes we find these significant sentences: "The thoughtful reader must have noted with some displeasure that I have scarcely, whether at college or at home, used the word 'friendship' with respect to any of my companions. The fact is, I am a little puzzled by the specialty and singularity of poetical and classical friendship. I get, distinctively, attached to places, to pictures, to dogs, cats, and girls; but I have had, heaven be thanked, many and true friends, young and old, who have been of boundless help and good to me, nor I quite helpless to them; yet for none of whom have I ever obeyed George Herbert's mandate, 'Thy friend put in thy bosom!'" His interests, generally speaking, were in impersonal things.

The household, however, is not completely described in what has been said. He was himself to be a bishop, but his father and mother were only *nouveaux riches*, and they had an English sense of that fact. They were economical, kept only female servants, and no horse, had but one acre of leasehold land for the garden, and gave no great entertainments. There were occasionally dinners to customers, with excellent sherry; there were few callers, his mother not caring to leave a card on foot at the doors of ladies who dashed up to hers in their barouches. On the other hand, the child perceived that there was a discernible distance observed towards the Croydon relatives, whom he was not often allowed to visit; and when the rare occasion came, he was never permitted to go off to play with his cousins. His father had but two ambitions, one to head the list of sherry importations, and the other that his son should be a genius, preferably in the Church, and, if not there, then among the poets. He had a romantic streak in him, and after he had fretted a little with his wife, if the orders were less than had been expected that day, he read Scott, Shakspere, 'Don Quixote,' Byron, the 'Noctes Ambrosianæ,' and the like, and he read these authors without "the least missing of the naughty words," oblivious of the "Idol in the Niche." In time it came about that the boy, now in early teens, was asked what he would like to hear, and one day he noticed glances exchanged across the table when he "instantly answered 'Juan and Haidée.'" The selection was not adopted, and apparently the youth did not know what he was asking for. Certainly there was no prudery in the literature he was used to peruse or hear, beginning with the Bible; in connection with this he defends his mother from a suggested comparison with Esther's religious aunt in 'Bleak House.' The passage is curious:

> "For, on the contrary, there was a hearty, frank, and sometimes even irrepressible laugh in my mother! never sardonic, yet with a very definitely Smollettesque turn in it! so that between themselves she and my father enjoyed their 'Humphrey Clinker' extremely, long before *I* was able to understand either the jest or gist of it. Much more, she could exult in a harmless bit of Smollettesque reality. Years and years after this time, in one of our crossings of the Simplon, just at the top, where we had stopped to look about us, Nurse Anne sat down to rest herself on the railings at the roadside, just in front of the monastery, . . . lost her balance and went backwards over the railings down the bank. My father could not help suggesting that she had done it expressly for the entertainment of the Holy Fathers; and neither he nor my mother could ever speak of the 'performance' (as they called it) afterwards without laughing for a quarter of an hour."

It is worth notice, too, that having seen Taglioni once, his mother went whenever she was asked; and that his father would join him in a Sunday walk in Wales, though both of them had "a subdued consciousness of being profane and rebellious characters, compared with my mother." His father would talk sherry on Sunday, too. Altogether, there are anecdotes enough to show that religiousness was a matter of the child's education, but was mixed with mollifying elements in the parents.

Ruskin himself was really forced upon his mind and his books for what individual life he had. He wrote verses and stories and liked to possess a few geological specimens; he sketched a good deal; and these were the beginnings of his literary and artistic life. He was never really a scholar, not even as a boy. But what he learned best of all was to have a very high opinion of himself and his doings. He measured himself with no one, and his parents had backed him against the field for a bishopric or the laureate. When he was taken to riding-school, and he kept falling off, and the thing was given up, they took his not learning to ride as being a proof of a singular genius. They were never very cordial to a certain Mr. Pringle, who was the first person to intimate, "with some decision, that there were as yet no trustworthy

indications" of their son's eclipsing Milton and Byron. The youth, since he had talents, was bound to grow up, to borrow his own words, "nothing more than a conceited and unentertainingly troublesome little monkey." But he grew up, as we all do, at last, and the time came for him to go to Oxford, where he was duly entered as a gentleman commoner, one reason being that he might fail to pass examination as a commoner, and another that he would be a wearer of velvet and silk—"Yes, good reader, the velvet and silk made a difference not to my mother only, but to me."

Such a "home-boy" at Oxford was a *rara avis*, more particularly in such a set. He was safe enough, as he shows by the catalogue of his disqualifications. He had never touched a card, and he looked on dice "as people now do on dynamite"; he couldn't ride, he didn't bet, he had no temptation to be extravagant, because there were no Turners, and he was safe from "the strange woman," partly because he was in love, and "besides never allowed to be out after half-past nine." But he fared very well, behaved very nicely, worked at his books, and sustained his few rebuffs and student lessons well enough. His mother came down to spend the three years near him, and had lodgings in High Street where he went every evening: she wished to be by if he should be ill; and his father lived alone at home, except that he joined them on Sundays, and the three went "in the old domestic way to St. Peter's for the Sunday morning service; otherwise they never appeared in public, lest my companions should laugh at me, or any one else ask malicious questions concerning vintner papa and his old-fashioned wife." One wonders a little what Ruskin learned there, as we find him the next year saying at Rome that he "was not quite sure whether Trajan lived before Christ or after," and that he "would have thanked, with a sense of relieved satisfaction, anybody who might have told me that Marcus Antoninus was a Roman philosopher contemporary with Socrates."

The peculiarity of this family which has not been touched upon was a taste for pictures. Rogers's 'Italy' had early made the boy acquainted with Turner; and pictures had been bought—one Copley Fielding, which is recorded as the first real purchase—and others in turn. It was in Ruskin's taste the period of what he calls Proutism. A second important matter, yet unnoticed, is that the three took journeys together, at first in England to make the rounds of the country customers for sherry, and then very often on the Continent. Ruskin identifies the sources of his real education as Rouen, Geneva, and Pisa; but he does not disclose the method or history of their teaching in these volumes, though he has much to say of the last two in a strain of eulogy and description to which we are well accustomed. The first sight of the Alps from Schaffhausen, when he was fourteen years old, he counts as his awakening hour, and he describes it finely, of course; but he did not then know what it meant to him. When he visited Italy, just after leaving Oxford, he was ill, but the sort of appreciation of which he was capable is easily seen, and the forming style of 'Modern Painters' is easily read, in the extracts from his diary. The one noticeable thing is a good result of his wilful conceit in his refusal to take other people's eyes and judgments for his own, and in his rejection of what, whether rightly or wrongly, he did not like. This was so marked that he says his recent purchase of a Turner in a rather unbusinesslike way, which horrified his father, "coupled with my now irrepressible impertinences to Raphael and Domenichino, began to give me in my parents' eyes something of the distant aspect of the Prodigal Son."

The kind old people had a good deal to bear with him, first and last; but he was, by means of these journeys and the use of his faculties, gradually getting out of the tadpole state, and in a year or two more had won his way with the first volume of 'Modern Painters,' and was coming into that real education of which he does not tell the story at all, though he paints a few of its Alpine and Italian scenes. The son's progress was pleasing to his father, who was so anxious that he should be famous. Ruskin would read the fine passages of his manuscript after breakfast, and he says his father generally cried a little over them, but he grew aware of a difference arising between them, and when his father "found himself required to admire flat walls, striped like the striped calico of an American flag, and oval-eyed saints like the figures on a Chinese tea cup, he grew restive. Further, all the fine writing and polite éclat of 'Modern Painters' had never reconciled him to my total resignation of the art of poetry." A page or two later there is a speaking bit of penitence, on occasion of the old man's interrupting an æsthetic revery, as they were driving past the La Spina chapel at Pisa, with a question as to what he should give the coachman; whereupon, as the son says, "I took upon me with impatience to reprove and lament over my father's hardness of heart in thinking at that moment of sublunary affairs." But, notwithstanding such selfishness and conceit on the son's part, of which this is an example, his feeling towards his parents was always filial, and the relations between them grateful and indulgent.

The chapter, or rather, if one may say so, the continued episode, of Ruskin's love affairs is given very much emphasis. He fell in love with Adèle, the daughter of his father's partner, M. Domecq, a Catholic and somewhat foolish young lady, but she laughed at him. He says it was a serious matter to him, which he remembers with a kind of shame, but one does not see that there was any real passion in it or personal love, though he was moody over it for some years of adolescence. He takes a curious pleasure in ridiculing himself in this as in other parts of his early life. "In my social behavior and mind I was a curious combination of Mr. Traddles, Mr. Toots, and Mr. Winkle. I had the real fidelity and single-mindedness of Mr. Traddles, with the conversational abilities of Mr. Toots, and the heroic ambition of Mr. Winkle—all these illuminated by imagination like Mr. Copperfield's at his first Norwood dinner." He endeavored to recommend himself by giving her his views on Transubstantiation, to dazzle her by printing his first romance, "The Bandit Leoni," in 'Friendship's Offering,' and to melt her by a long French letter describing the desolation after her absence; but Adèle laughed—that was all. It was first love in a very young form. There were others later—a face in Rome, an eligible *parti* in England, and a charming Charlotte whom he wooed by writing a review; but all this is the mere drift of the time, related to his life only by chance. Of more interest and vastly more pleasure are the half-dozen portraits of the narrative, the Scottish relatives and servants and one or two Englishmen; best of all, Acland and Osborne, admirable examples of early English manhood; but these are not integral in the life and career of Ruskin, any more than the discussions of Byron or the descriptions of the Riviera which give substance to the volumes, and must be left one side.

Altogether these passages from Ruskin's past life illustrate his defects rather than his virtues. He looks on the figure he cut in them as usually comical and ridiculous, as may be seen from the quotations we have made; and, with all allowance for his exaggeration in expression, and with due regard for the fact that a man has a better right to laugh at himself than others to laugh at him, we think Ruskin is quite correct in the view he takes. This was a foolish way to bring up a child, and foolishness was justified of her works. His isolation from other boys and their rough-and-ready doings explains, in some measure, the deficient manliness of his character, his lack of practical sagacity, and his incapacity for rational conduct in affairs. With the best motives and lofty aims, he has foiled himself because he cannot deal with men as his equals, and has succeeded only when it was possible for him to move among them as a patron. The conceit that was bred in him has never been eradicated; he calls it by other names as he grows older, but the thing remains unchanged, and there are half-a-dozen examples of it here which would be incredible in any other writer. Where his own talent is concerned he has little sense of proportion, and often none at all; and, of course, his opinions are simply of Delphic authority. The religious influences, too, largely defeated themselves; it is not agreeable to read his remarks about his early belief and his routine devotions, because their tone is really cynical. His religion became a cult of historical æstheticism in art, and a fervid obedience to that half of the moral law which is concerned with the duties of man to his neighbor. It is a pity that his autobiography should deal only with these childish things, and not illustrate at all that ethical instinct which makes him memorable. His narrative is also marred to us very much because he is conscious of the vulgarity of his origin in a way hardly consistent with true dignity. He often speaks rather patronizingly of his parents, and this is a fault both of taste and of justice. Such reflections as these are bound to arise in the mind, and it is impossible to offset their weight; but the volumes are written like friendly confidences, and, in the case of a friend, one would not judge, but rather obey the maxim written more than once in these pages: *Guarda e passa.*

ROOSEVELT'S BENTON.

Benton. By Theodore Roosevelt. Boston: Houghton, Mifflin & Co.

THE announcement that the next biography in the "Statesmen" series would be by Theodore Roosevelt reminded us that we had failed to notice his Life of Benton, which was published more than a year ago. For this omission an apology is due to the author; but we beg him to believe that his book, if not reviewed in type, has been viewed and reviewed more than once in the study. Thomas Hart Benton is worth studying both as a type and individual. Mr. Roosevelt has most correctly shown that he is a representative of the West in its early generation as distinguished at once from the East and the South; that it is a pure blunder to suppose, because he was a Missourian, descended from Virginians, that therefore he and his like are to be ranked as essentially belonging to the South as opposed to the North; or as upholders of slavery as opposed to equality. The men who subdued and held the Mississippi Valley in the first quarter of this century were rapidly consolidating a community of their own, which looked to such men as Benton as its leaders, and which surveyed both the south-

western and the northeastern maritime States as equally open to its alliance or antagonism. The mutual compliments of Hayne and Benton in the famous debate of 1830 can be interpreted on no other principle. Mr. Roosevelt is particularly accurate in dealing with the Western, or, as we may properly call it, in contrast with our later West, the Southwestern character, as affected by the slavery question. He shows that, though Benton and those whom he represented were slaveholders, the institution occupied an entirely different place in their lives from what it did in those of the Coast cotton-lords. Mr. Roosevelt's eighth chapter is particularly instructive on this topic.

In his lively and energetic development of the Western character, the author seems to us at times carried away so as to overlook its defects. There is something dangerously like Carlyle's eulogy on old Frederick William in the encomiums he bestows on the hard, dogged, fighting farmers that considered the sum and substance of national duty to be swarming out the Indians and Mexicans, and "revindicating," as a Frenchman might say, the Mississippi Valley—forcibly if they could, peaceably if they must—for the sons of the settlers on the Upper Cumberland and the French Broad. There is a stain of blood and iron, muscular Christianity *minus* the Christian part, in the author's philosophy of civilization, as it appears from parts of some of his chapters, which look as if he was "spoiling for a fight." If Mr. Roosevelt shall be an active American statesman thirty years hence, we trust he will recast more than one sentence in his chapter on the "Boundary Troubles with England," when a longer life shall have shown him the boundless evils entailed by war.

In his account of the strife of parties during the Administrations of Jackson, Van Buren, and Tyler, the author has aimed to combine a reasonable regard for the demands, motives, and passions of the times, with the coolness of a philosophic historian who surveys the whole after the event, when the actors each saw only a part. He has undoubtedly succeeded well in this effort; he shows that he really appreciates the intense interest attaching to the Congressional and popular contests of this period, so little appreciated by common students of American history, who seem to know little or nothing of any great debates between that on Foote's resolution and that on the compromise of 1850. His account contains many very acute and sensible verdicts on the great men of that time, from among which we would especially refer to a judgment upon Mr. Calhoun on pages 165–168. It is too long to injure by quotation; but we advise all who have adopted the prevalent views of statesmen of 1830–1850 to ponder, in the light of all we now know, this entire passage, and especially its closing sentences: "Doubtless in private life, or as regards any financial matters, Calhoun's conduct was always blameless; but it may well be that he has received far more credit for purity of motive in his public conduct than his action fairly entitled him to."

We are not certain that Mr. Roosevelt does not like to find such verdicts a little too well. After reading over very carefully his account of American politics during Benton's "thirty years in the United States Senate," to transfer the title of a book to a life, it seems to us that with a little practice he might rival Macaulay's description of Hallam, and be the "hanging judge, the Page or Buller," of American history. His black cap is always on. There is some radical defect of heart or head or both in every one of the characters of that remarkable period as he handles them. He can hardly make out that Mr. Benton was the wisest of all of them, or the most unprejudiced, or the least infected with party violence—and indeed it is fair to say that his regard for his hero never degenerates into worship or Boswellism; but he continues to leave on one's mind the general impression that Benton had more single-hearted patriotism than any of his great competitors. We must express our conviction that this deduction is essentially unjust to several of them.

The fact is, that Benton was one of those men who mistook getting very angry for being deeply convinced. He had the peculiar narrowness of mind which belongs to the citizen of a big community as opposed to a great nation. At the time of the battle of Salamis, Athens was very small and the Egyptians very numerous. At the time of Peter the Great, Holland was very small and the Russians very numerous. But as far as real breadth and depth and height of humanity was concerned, Athens and Holland were centuries ahead of Egypt and Russia. So in Benton's time; the idea of the manifest destiny and boundless expansion of the pioneers of the West was a limited and barren idea in comparison, not merely with the wishes, but with the limitations that belong to the statesman of the East. It may be that New England failed to comprehend the future greatness of Oregon; but Mr. Choate's speech on the boundary dispute has, to our mind, far more of the real greatness of nationality than all the 54° 40′ hurrahs, which appear to strike a responsive chord in Mr. Roosevelt's heart. Missouri was a very great State, Delaware a very little one; but we cannot help thinking the speeches of Senator Clayton, with all his undoubted faults, would be a better institute of politics than those of Senator Benton, with all his virtues. It can hardly be that all the assertions of nationality made by all the wings of the Democratic party from 1807 to 1847 did as much to bar the right of search, once for all, as Mr. Webster's unanswered and unanswerable despatch to Lord Aberdeen. Undoubtedly the opposition to General Jackson let party get the better of patriotism sometimes, as all parties will. But that on the whole they maintained a higher tone of national and international morality than his friends did, is our conviction more than it seems to be Mr. Roosevelt's.

The conclusion of Mr. Benton's life, with the injustice of his own State to him, is well told. We regret that Mr. Roosevelt could give no more space to the private life of so individual a personage. Indeed, he seems towards the end of his volume to be under pressure to finish a book which was perhaps too diffuse in its early parts. The impression he leaves on his readers of his subject is on the whole favorable. An honesty of purpose which was persistent and sincere, though often found allied through party with very different qualities in other men; an energy not always according to reason and humanity, but untiring and undaunted; a culture often uncouth, diffuse, and untimely, yet apparently the growth of a real love of learning and improvement; a patriotism narrow, prejudiced, local, yet steadily growing wider and loftier; a pugnacity, more appropriate to an earlier period of the world's history, which said, "I do well to be angry," mixed with a real kindliness of feeling where the old pioneer temper of suspicion was overcome—these combinations make a character that one cannot help noticing, cannot help censuring, yet which has on the whole strong titles to our respect, though perhaps not quite as high as that which our author accords.

Mr. Roosevelt has not failed to notice Benton's queer fondness for a certain kind of inflated eloquence and undigested learning. He is quite right in connecting this taste with Jefferson's name; but the whole race of Virginia statesmen was more or less addicted to it. A delicious instance of how Benton managed to use his hobby of free salt as seasoning for his *macédoine* of classics, will be found on page 93.

We cannot always commend the style of this biography as we could wish. There is a decidedly journalistic flavor about it. "Voiced," "stay for good," "dwarfed all other issues," remind us much of our esteemed contemporaries. There is also a marked flavor of the "boundless paroarer" when describing the inhabitants of that region. But such defects are more than compensated by the number of very shrewd remarks, in very racy and at the same time perfectly classical English, upon a variety of subjects as to which too many people hold conventional views expressed in conventional phrase. We would specially commend the remarks on Randolph's eloquence (p. 62); on the tariff (p. 67); on Harrison's nomination (p. 232); on Southern sympathy with Kossuth (p. 275); and on Jefferson (p. 276).

RECENT NOVELS.

Mrs. Pennicot's Lodger, and Other Stories. By Lady Sophia Palmer. Macmillan & Co.

Roy's Repentance. By Adeline Sergeant. Henry Holt & Co.

Harmonia: A Chronicle. By the author of 'Estelle Russell.' Macmillan & Co.

Looking Backward. By Edward Bellamy. Boston: Ticknor & Co.

The Doctor of Deane. By Mary Towle Palmer. Boston: D. Lothrop Co.

Lady Sophia Palmer's book of stories is certainly above the average in originality, imaginative quality, and variety of subjects. Of the six sketches, one is made on Italian ground, one on French, one on Judaean; the remaining three, though all English, range from London to Hinde Head, the dialects from a Sussex drover's to that of a London lodging-house keeper. It would be captious, perhaps, to assert that these features give the book the aspect of an itinerary, since the graceful dedication states that the stories were written mainly to preserve differences of custom and speech. This would seem a superfluous task, for English peasantry of all time are likely to say "they was," and Italians to exclaim "Madonna mia"; and deeper than this the geographic distinctions hardly go. A better reason for the existence of the book is that the stories are fresh, compact, vivid, and tender, and written, excepting an occasional obscure sentence, in the facile style which is second nature to our English sisters, and with a directness not always theirs. If the tales cannot be ranked in the first class, they take a highly honorable place in the second.

That this same English facility of pen may be a fatal possession is every day attested by a fresh flood of novels relating to the ill-used and irresistible governess. Unworthy and poor relations of 'Jane Eyre,' they inherit from their immortal progenitor a few outward features with none of her bone and sinew. We should suppose that the most all-devouring reader of fiction must by this time be sated with the adventures of this persecuted yet all-conquering young person, and that the manufactory for the production of novels for her benefit might be closed—for there must be one, as there is said to be for Verboeckhovens. In 'Roy's Repentance' the wandering Jewess appears under the name of Laurence Erle. She is of distinguished parentage, even of noble on

the maternal side. Her father is, unhappily, only a rich merchant; but we are mortal. She does not know that she is handsome. This ignorance is the birthright of her race, and they part with it only on overhearing comment from their pupils' elder brothers. Miss Erle has the further advantage of hearing herself called a cameo, across the garden wall, by a chance passer-by, while she holds a position in a school. That he, in order to spare her feelings, with true tact, so soon as he perceives he is heard, professes to have been speaking of the gargoyle, does not deceive the reader, and still leaves the governess in possession of the charm of unconsciousness—a felicitous device. Of course there is no place for cameos in a boarding-school, and this cameo, after the usual interlude in London, at the usual neat lodgings, kept by the usual old family retainer, becomes a governess in a family which, as usual, proves to be that of her mural admirer. Her charges are the historic three—the good one, the bad one, the indifferent one. The elder brothers are at once her slaves, and she sets about reforming the inebriate habits of the one and repelling the love-making of the other. The old invalid gentleman up stairs also finds her the staff of his life. The surrounding women, it is needless to say, are embodiments of envy and malice. In this school of novels the unconsciously beautiful heroine is always the monopolist of sense, virtue, and charm. Small wonder that, from the family lawyer to the family butler, all the masculine characters burn incense to her. But one figure is still wanting—the hero—who in due time, with full equipment of disillusionized heart and cynic brain, is ushered in with thunder and lightning in the nick of time to save the governess from death by a splitting fir tree. In five minutes she is telling him, "I have no pleasure in my life. My years are like a blank, dull waste," and he is saying, "You will not think so by and by, when the sun is shining and you are conscious of the young, vigorous life," etc.

The most salient feature of 'Harmonia' is its length, but, after enduring for a season, one learns to pity, and in a mild degree embrace, even as a sojourner in some dull village passes from apathy to observation, and thence to interest in the prosy annals of the place. 'Harmonia' disarms criticism by styling itself a chronicle; wisely, for there is no plot, no construction, no climax, but day upon day of little doings. The persons are chiefly English settlers of to-day in a wholly unreconstructed Southern State of America, who are trying to build a town, farm the land, and make their fortunes. The juxtaposition of English and the native blacks makes a contrast in races effective and new. The few white Americans who appear are mainly "poor trash," or swindling land-agents, or shirking clergymen. The exceptions are one or two American women who, spite of the inevitable English appointments for American women of hobbies and divorces, are meant to be, and are, attractive characters. In other words, it is an English view of life on American soil; the livers being English, under the not unpicturesque phase of a new settlement in a region comparatively old. It is observable that this gives the English a capital chance to have the best of it, and we must own to sharing the wicked American land-agent's regret that the foreign settlers should buy up the land, obtain influence, and yet despise the privileges of citizenship. The wicked land-agent's revenge even Americans must deplore, but it is well to allude to it, that those intending to read the book may perceive that it is not wholly without the scent of battle. There is burglary, there is kidnapping, there are snakes, but not to any uncomfortable extent. Naturally arise the discussions of a thousand topics —personal, social, and political—which are treated with honesty and spirit. The negro portraits are especially lifelike, though not from most agreeable originals. The English colony, as hinted, absorbs most of the merit and the spoils. Among its numbers are some very real persons, and the chronicle of their very real doings, told with humor and zest, will have an attraction for those who like pictures of life and manners rather than form and dramatic quality—pictures, let it be added, nearly coequal in extent with the original occurrences.

Forecasting the future by projecting one's self into the next century has been a favorite feat since literature was in its cradle, and bids fair to be so till its grave. Mr. Bellamy, however, has succeeded in investing the well-worn theme with a new interest, not only by certain original machinery, but by his evident enthusiasm for his subject. "Looking Backward" is a well-made book, but it is more—a glowing prophecy and a gospel of peace. He who reads it expecting merely to be entertained must, we should think, find himself unexpectedly haunted by visions of a golden age wherein all the world unites to do the world's work like members of one family, where labor and a living are provided for each man, where toil and leisure alternate in happy proportions, where want and therefore greed and jealousy are unknown, where the pleasures of this world are free to all, to cheer but not enslave. The miracle is wrought by "the national organization of labor under one direction." He who would ask if this be sound political economy, let him ask if Donatello's ears were really furry. To hold up to contemplation a world "blessed with plenty, purified by justice, and sweetened by brotherly kindness" is one of the good offices of romance. Thanks to Mr. Bellamy's ingenious device, we can see it with our own nineteenth-century eyes, and enjoy besides the mysteries he prepares. Thanks to the larger interests of the book, we can put it down in a pleasing tingle of optimism. Mr. George might object that the author begs the land question, that his schemes ought theoretically to have restored the state of society of ancient Peru instead of bringing about the millennium; but Mr. George himself would rejoice in a realized ideal of socialism such as this, and would even forgive the presence of his favorite bugbear, "white parasols and elephants mad with pride."

If the village of Deane had been properly drained, the 'Doctor of Deane' would never have been written. As it is a book worth the writing and the reading, that would have been a pity, and so one is fain to forgive, while condemning, one case of low fever, one narrow escape from drowning followed by fever, one case of hypochondria, one of consumption, one of nervous prostration attended with insanity, and one of typhoid fever, afflicting the principals of the story, besides fevers in sufficient quantities to supply the chorus of villagers. However, when the hero is a young physician, and the heroines have each a vocation for visiting the poor sick, one must expect the text to be more or less like the materia medica. Having lifted voice against the spread of contagion by malady-ridden novels, we gladly turn to the merits of this bright and well-written little book. Within its modest limits it holds an uncommonly distinct and agreeable group of portraits. Uncommon, too, is the perceptive quality which has taken note of innumerable subtleties of thought and feeling under the conditions of daily life, and set them down with a faithfulness that is in touch with nature, yet that never becomes odious by over-analyzing. We are not perfectly sure that every feminine reader will agree with the author in writing down modesty as Dr. West's most impressive trait, but we are sure that there will be found in the book a happy alternation of the thoughts that sparkle and those that softly shine.

Elements of Scientific and Practical Agriculture. By George Gemmell McKay. Baltimore: The Baltimore Publishing Co.

First Lessons in Agriculture. By F. A. Gulley, M.S., Professor of Agriculture in Agricultural College of Mississippi. Starkville: Agricultural College.

THESE two small treatises on agriculture come to us from two Southern States. The first is intended to be used as a text-book in the public schools. Whether the systematic study of agriculture, through the medium of a suitable text-book, might with advantage be introduced into the common schools of the rural districts of Maryland or the other States, is certainly a question worthy of consideration; but we are quite certain that in case of an affirmative answer, the "suitable text-book" would have to be a far different book from Mr. McKay's. It is very evident that he has had very little experience in making text-books or any other kind of books, and, whatever may have been his merits as an "Examiner of Public Schools, Alleghany County," we should hesitate about certifying to his accomplishments as a teacher. In the first place, there is one great blemish affecting every page of his book, giving it a mottled appearance, and annoying and confusing the reader. Mr. McKay does not use italics, but in their place a full-faced type of somewhat larger size than the rest of the text, thus making the words printed in that type extremely prominent. This means of calling attention to certain words in a sentence, he has employed with the most unsparing liberality; but in a large proportion of the cases it is impossible to understand why the particular words he has thus honored were selected in preference to half-a-dozen other words of equal importance in the same sentence. If any one will read aloud to a friend one of the thickly speckled pages of this book, putting a special emphasis on the words printed in full-faced type, he will certainly run the risk of being interrupted with the question, Why do you read in such an absurd way?

The author treats at great length in several chapters on the influence of water and air in disintegrating the primitive rocks and turning them into what he calls "soil," for to him every form of earth that is not rock is soil. In doing this he personifies oxygen and carbonic acid, representing them as two workmen laboring upon the rocks. He also gives us a long account of a visit to the Mt. Savage fire-brick works, and speaks of the kindness of Mr. Findlay, the foreman of mines, who took him a long way under ground, etc., etc., all of which would be much more in place in a letter to a newspaper than in a text-book for schools. Of course the book contains much that in any case would fittingly have a place in a text-book; but its whole plan, structure, and style would have to be altered—much omitted, much explained, and much inserted—before it would be fitted for the pupils of a rural public school.

"The derivation and meaning of a few words, which may not be familiar to all, have been given at the end of the book for the convenience of those who may not have a diction-

ary at hand." On what principle this short vocabulary has been constructed, it is impossible to say. Most of the words it contains are neither unusual, nor technical, nor agricultural, while many words belonging to one or the other of those classes, and which occur in the text, are not inserted in it. Thus, on the first page of the vocabulary, we find the words: accumulated, alienated, alleviate, alliance, animated, artificial, avail, with their ordinary dictionary definitions, while, to mention a single instance, the word "granules," used in a technical manner, occurs on page 19, but is not contained in the vocabulary.

Mr. McKay has evidently read a good deal about geology and agricultural chemistry, and has inserted a large amount of high science in his book, much of it entirely beyond the capacity of the pupils of public schools, and all of it in a crude, undigested state that renders it of little value to anybody. It is somewhat singular that the book, though intended to be used as a text-book, and therefore presumably to secure a somewhat extended circulation, contains no indication of being copyrighted.

The second book on our list comes from Mississippi. It was prepared in pursuance of a request of the Board of Trustees and of the President of the College. It is a 12mo of only 118 pages, printed in rather large type. It is surprising how much clear and useful information the author has been able to condense into this narrow compass. Whatever restrictions may have been really imposed upon him by narrow limits, he has yet had the skill, so agreeable to the reader, to seem always to have room enough to say all he wanted to and in the way that suited him. Of course, the treatment, as a whole, and of particular subjects, is particularly adapted to the extreme South; but the book may be read with pleasure and profit by any one interested in agriculture in any latitude. As an example of Prof. Gulley's skill, we would mention his treatment of the subject of fertilizers. The different kinds, their chemical composition, the special advantages and best manner of using each sort, and their market value, are all treated in a manner apparently full and complete. From some passages we infer that Prof. Gulley has for some years been manager of the farm connected with the Agricultural College, that he has availed himself of his opportunities for experiment, and that he has a keen eye not only for scientific, but also for pecuniary results. Although he does not expressly mention the subject, yet it is easy to see that he does not regard the exhaustion of the cotton lands of the South as either necessary or imminent. With the spread of intelligence, and the improvement in the methods of cultivation, there is no reason why the production of cotton should not be increased and indefinitely prolonged.

A short glossary of agricultural terms is appended to the work.

Science Sketches. By David Starr Jordan. Chicago: A. C. McClurg & Co. 1888. 8vo, 276 pp.

THIS volume is made up of a number of unconnected sketches and addresses on such varied subjects as the natural history of fishes, the biography of naturalists, an ascent of the Matterhorn, and the evolution of the college curriculum in America, with an appendix giving a bibliography of the author's contributions to scientific literature. Three of the articles are printed for the first time, and the others, which have appeared in various periodicals, have been more or less revised.

The papers make no pretence to literary quality, and are of various degrees of merit. Naturally, those relating to Prof. Jordan's favorite animals, the fishes, are the most interesting and possess the most value. That on the salmon family easily stands first. Naturalists will be grateful for the kindly review of the life and work of the veteran naturalist of Cuba, Felipe Poey, and the sketch of the less lovable, more erratic, and ever enthusiastic Rafinesque. The account of the ascent of the Matterhorn is well told, and will attract the attention of readers adventurously inclined. The paper on the evolution of the college curriculum adds little to what has been said by others, and suffers from a discursiveness which somewhat obscures its aim. The bibliography of Prof. Jordan's writings will have a high value for ichthyological students, and gives the little book a permanent value which would not have been insured by the articles that constitute its text.

Memoirs of an Arabian Princess. An Autobiography. By Emily Ruete, *née* Princess of Oman and Zanzibar. D. Appleton & Co.

THIS book derives not a little of its charm from its faults. Its style is artlessness itself, which we would by no means hold a defect except as it leads the writer into the prettiest self-contradictions and inconsistencies. Yet the very inconsistencies reveal a true consistency and truthfulness in the book, since they stamp it as the unaffected narrative of a life divided into two strangely opposite halves —one part led in the secluded home of the Sultan of Zanzibar, the other as a German wife, mother, and widow. The ex-Princess writes throughout as one whose intellect had become convinced of the immense superiority of European civilization to that of the Arabs, yet whose heart clung fondly to the customs of the land of her childhood. Hence come her defences of the Mohammedan practices of polygamy, of slavery, of the seclusion of women, in all of which we get a better idea of her loyal affection for her home and kindred than of her ability intelligently to discuss such important social questions. The book professes to be written primarily for her children, and its body of simple reminiscences bears out this profession admirably. Upon a thread of personal experience she has strung a series of highly interesting accounts of the social and religious customs of the Arab nobility. Add her own remarkable adventures, told in a delightfully because unconsciously egotistic manner, and the whole makes a book which ought to attract many readers. The grosser literary blemishes are due, we suppose, to the translator, the 'Memoirs' having been originally written in German.

The Enemies of Books. By William Blades. Revised and enlarged by the author. A. C. Armstrong & Son. 1888.

THIS latest issue of "The Book Lovers' Library" is a very entertaining little volume, in which the destroyers of books, elemental, human, or vermicular, are very properly made the object of anathema. Fire and water have had their share, but they have been merely no respecters of persons, and Livy was to them no more than the Parthenon or Baiæ. Worms must have their food, beetles and rats and flies and servants and children may all plead some excuse of nature for their havoc, and against such lifeless things as gas and heat, mould and moss and ivy, it would be foolish to be intemperate; but the great destroyers of books seem rather to have been bigotry, ignorance, and neglect, and the sins of the last are the deepest in dye. Many of the stories told here seem incredible, but some of them are only too familiar; and so far as the old books are concerned, the manuscripts and "the fifteeners," it is to be suspected that it is rather the enormous rise in their money value than any respect for learning which has put a stop to the carelessness which was their lot up to the last quarter of a century. Clergymen now will not cut off margins to use for note paper, nor librarians consign Caxtons to the grate, or leave them to rot in the rain; but it appears that collectors of woodcuts or engravings, title-pages and colophons, maps and portraits, still tear old books to pieces, and even cut the illuminated initials out of manuscripts, to add to their museums. Many curious anecdotes, nevertheless, are told by Mr. Blades of ignorance and negligence in recent years, and those interested in books as such will find pleasant reading here, together with some valuable suggestions about the care of books. This library has not given to "book lovers" a volume which belongs to it by better right.

The United States of Yesterday and of To-morrow. By William Barrows, D.D. Boston: Roberts Brothers. 1888.

THIS book is pitched in a somewhat old-fashioned key. It has the twang of the Fourth of July oration of the days before the war. The length of our coast-line, the size of our rivers, the extent of our territory, the numbers of our hogs and of our citizens, are the facts upon which this writer expatiates, and with which he endeavors, by means of all sorts of comparisons, to overwhelm the imagination of his readers. Those who like to be told just how many times England could be put into the United States, and how many States of the size of Massachusetts could be carved out of Alaska, will find here an abundance of the nutriment which they affect, and will probably like it all the better for the turgidity of style which seems inseparable from writing of this kind. But stupefaction before mere magnitude is not a desirable mental attitude. The size of our country is impressive; the increase of our wealth is fabulous; the growth of our population is amazing; but if a writer have mastered these facts in all their details and have not simplicity of speech, it profiteth him nothing. If Dr. Barrows would cease to strain after effect, and just tell us what he knows—and his knowledge is really extensive—he would produce books of permanent interest and value.

BOOKS OF THE WEEK.

Ainger, A. Letters of Charles Lamb. 2 vols. A. C. Armstrong & Son. $3.
Bangs, J. K. Katharine: a Travesty. New York: Privately Printed.
Benner's Prophecies of Future Ups and Downs in Prices. 4th ed. Cincinnati: Robert Clarke & Co.
Berkowitz, Rabbi H. Judaism and the Social Question. John B. Alden. 50 cents.
Bristol, Dr. E. L. M. A Story of the Sands, and Other Poems. Brentanos. $1.
Carter, Captain R. K. Divine Healing. New ed. John B. Alden. 50 cents.
Culver, H. H. Epitome of Anatomy, Physiology, and Hygiene. Boston: Ginn & Co. 25 cents.
Doumic, René. Eléments d'histoire littéraire: Littérature française. Paris: Delaplane; Boston: Schoenhof.
Evans, Margaret. Letters of Richard Radcliffe and John James, of Queen's College, Oxford, 1755–83. Oxford: Clarendon Press; New York: Macmillan.
Faliex, E. Œuvres choisies de Diderot. Paris: A. Lemerre; Boston: Schoenhof.
Forbush, W. B. Poems of a Boy. Hanover, N. H.: Privately Printed.
Foster, J. Ellen. The Crime against Ireland. Boston: D. Lothrop Co. 60 cents.
Greenough, Prof. J. B. Satires and Epistles of Horace. Boston: Ginn & Co. $1.35.
Hare, A. J. C. Walks in Paris. George Routledge & Sons. $3.
Haussonville, Comte Othenin d'. Prosper Mérimée—Hugh Elliot. Paris: Calmann Lévy; Boston: Schoenhof.
Herbert, M. Poems of "Frank Forester" (Henry William Herbert). John Wiley & Sons.
James, H. E. M. The Long White Mountain; or, A Journey in Manchuria. Longmans, Green & Co. $6.
King, T. Haschisch: A Novel. Brentanos. 25 cents.

Henry Holt & Co.

PUBLISH

The Causes of the French Revolution.

By R. W. Dabney, Professor in Indiana University. 16mo, $1.25.

Loyalty George.

A Novel. By Mrs. Parr, author of 'Dorothy Fox.' Cloth, $1.00; paper, 30 cents.

"BOOK NEWS"

Gives the pith and marrow of every new book; says why this book should be read, and that skipped. News of the book world; original articles by the foremost writers, and with each number a detached portrait (7¼x10¼) of a popular author.

Monthly. 50 cents a year, postpaid. *Sample copy free.*

JOHN WANAMAKER,
Philadelphia.

Invaluable to Travellers going Abroad.

MACMILLAN & CO.'S *NEW BOOKS.*

Now Ready, Vol. I., 12mo, Paper, 50 Cents; Cloth, limp, 60 Cents; Cloth, edges uncut, 75 Cents.

TWELVE ENGLISH STATESMEN.

Under the above title Messrs. Macmillan & Co. beg to announce a series of short biographies, not designed to be a complete roll of famous statesmen, but to present in historic order the lives and work of those leading actors in English affairs who by their direct influence have left an abiding mark on the policy, the institutions, and the position of Great Britain among the States.

The following list of subjects is the result of careful selection. The great movements of national history are made to follow one another in a connected course, and the series is intended to form a continuous narrative of English freedom, order, and power. The volumes, which consist of the following biographies, are in press or in preparation:

WILLIAM THE CONQUEROR. By Edward A. Freeman, D.C.L., LL.D. Ready.
HENRY II. By Mrs. J. R. Green.
EDWARD I. By F. York Powell.
HENRY VII. By James Gairdner.
WOLSEY. By Prof. M. Creighton. April.
ELIZABETH. By the Dean of St. Paul's.
OLIVER CROMWELL. By Frederic Harrison.
WILLIAM III. By H. D. Traill. May.
WALPOLE. By John Morley.
CHATHAM. By John Morley.
PITT. By John Morley.
PEEL. By J. R. Thursfield.

The Dean of St. Paul's.

COLLECTED EDITION OF DEAN CHURCH'S MISCELLANEOUS WRITINGS. Uniform with the collected works of John Morley, Matthew Arnold, etc. In 5 volumes. Globe 8vo, each $1.50. To be published in monthly volumes.

Vol 1. MISCELLANEOUS ESSAYS. *Ready.*
Vol. 2. DANTE, and other Essays. *April.*
Vol. 3. ST. ANSELM. *May.*
Vol. 4. SPENSER. *June.*
Vol. 5. BACON. *July.*

Mrs. Oliphant's New Book.

THE MAKERS OF VENICE. Doges, Conquerors, Painters, and Men of Letters. By Mrs. Oliphant, author of 'The Makers of Florence,' etc., etc. With numerous Illustrations. 12mo, $3.00.

Twenty-fifth Annual Publication (revised after Official Returns).

THE STATESMAN'S YEAR-BOOK. For the year 1888. A Statistical and Historical Annual of the States of the Civilized World. Edited by J. Scott Keltie, Librarian to the Royal Geographical Society. 12mo, $3.00.

"That valuable compilation, 'The Statesman's Year-Book.'"—*Mr. Gladstone in the Contemporary Review for March.*

"The ideal book of reference."—*Saturday Review.*

LIFE IN COREA. By W. R. Carles, F.R.G.S., H. M. Vice-Consul at Shanghai, and formerly H. M. Vice-Consul in Corea. With illustrations. 8vo, $4.

"Has, in fact, superseded 'Austin's Treatise.'"—*Law Magazine and Review.*

MACMILLAN & CO., 112 Fourth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, APRIL 5, 1888.

The Week.

A DUPLICATE of Senator Chace's International Copyright Bill has been introduced into the House by Col. W. C. P. Breckinridge, and referred to the Judiciary Committee, and a hearing before that Committee was in certain respects very much more satisfactory than that accorded by the Senate Committee. All but one of the members of the Judiciary Committee were present; all gave what appeared to be intelligent attention to the statements submitted; and all, or nearly all, expressed, at the end of the hearing, their cordial approval of the measure. There seems to be no question but that it will be favorably reported to the House, and probably by a unanimous vote. Speaker Carlisle has expressed his interest in doing whatever may be practicable from the Speaker's chair to secure favorable attention for the measure when it comes up, and it is the expectation of Col. Breckinridge and others that it will probably prove possible to secure the hour's consideration necessary some time within the next few weeks. The measure has now so many friends among the leaders of both sides of the House (with the Democrats, for instance, Breckinridge, Cox, Patrick Collins, etc., and with the Republicans, Kelley, Reed, Hitt, and others), that the motion to give consideration to it is likely to be favorably received at any time when the House may not be absorbed in the appropriations or tariff business. Mr. Randall has already expressed general approval of the measure, and is expected to allow whatever time is needed for it, to be borrowed, if necessary, from "appropriations."

An obvious comment on Senator Plumb's amendment to the Bond-Purchase Bill is that there is no way to put his new-fangled non-legal-tender notes in circulation, and that "issuing" them means, therefore, putting them to bed and tucking them up in the Treasury. We observe that this point was made against the amendment by Senator Hiscock, and that Mr. Plumb answered by asking Mr. Hiscock what he should think of the plan of applying them to the payment of the national debt. Mr. Hiscock did not have the right answer at his tongue's end, viz., that the plan of paying the bonds in greenbacks was fought out just twenty years ago, in the campaign of 1868, although the issue was different then, since we had not resumed specie payments. At present the process would be as follows: The Government buys a bond of $1,000, paying say $1,250 gold. This causes the retirement of $900 of national-bank notes. The Government then "issues" $900 of non-legal-tender notes, and in order to get these notes in circulation buys $900 worth more of bonds, which would be a bond for $720, or at that rate. The holder of the notes, probably not liking the looks of them, as they are not legal tender, would go to the Sub-Treasury and draw the gold on them. If he did not, the bank in which he deposited them would. Then the Government would have them back again, and would repeat the operation, buying another $720 bond, parting with $900 more of gold, and getting the notes back in due course, and continuing the process as long as any gold was left. Would it not be a saving in shoe leather to pay out the gold for the bonds directly?

Senator Edmunds hit Senator Sherman a hard rap in the debate on the Blair proposition. Mr. Sherman, after recanting the position taken in his Nashville speech of last year, that he would "not reproach any man for the part he took in that fight," fell back upon his old ground, and has since maintained it, that "rebels" ought to be "reproached," and that, as he said in his Springfield speech, "every nation to which these gentlemen [ministers, consuls, etc., who had served in the Confederate Army] are accredited, may fairly conclude that it was the rebel cause that triumphed, and not the Union cause." But now comes Senator Edmunds and talks in this strain: "Nobody objects to Confederate soldiers or Confederate citizens sitting in this chamber," or being accredited to foreign countries; "they stand just like every other citizen, no better and no worse"; "there is oblivion on that" (the rebellion), "and without regard to their previous history in that respect they are common and equal citizens, with equal rights with anybody else." If John Sherman or any other bloody-shirt orator after this complains because "rebels" are appointed to office, it would seem as though the Democrats could not do better than to engage George F. Edmunds to denounce as it deserves such unpatriotic talk.

The vigorous speech in favor of tariff reform delivered in the House on Thursday by Mr. Nelson, Republican Congressman from Minnesota, is a noteworthy sign of the times. It shows that the Republican party cannot be held to the absurd policy of mere opposition to all tariff legislation, which Eastern protectionists of the Kelley school advocate. Mr. Nelson knows what he is talking about when he declares that the people want reform, for he was reëlected by the almost unanimous vote of his district because of his advocacy of reform, while at the same time he saw a colleague in another Minnesota district, who had declared for a high tariff, lose by over 5,000 votes the district which he had carried two years before by nearly 4,500 votes.

The Providence *Journal* takes notice of a terrible threat made by Mr. Butterworth of Ohio, at a recent tariff meeting in that city, "that if Rhode Island dared to touch the wool on the sheep's back, the woolgrowers would turn around and make this State a howling wilderness." Of course, Mr. Butterworth did not mean that if the duty on wool were repealed, the wool-growers would invade Rhode Island with torches and tomahawks and burn the factories and put the inhabitants to the sword. He meant that they would repeal the duty on woollen goods, and he really believes that that would be the same thing as making the State a howling wilderness. Could there be a more naïve expression and true definition of the protectionist creed than this? Wool is only one of some thousands of articles in the tariff the whole of which, according to the tariff gospel, go to make up the aggregate and sum total of the national prosperity. Yet, if by any mischance wool should be put on the free list, these good patriots would turn the whole country into a howling wilderness if they could. The Providence *Journal* thinks, however, that Rhode Island exists by the grace of God and not by the forbearance of Western shepherds. It mentions the fact that "the Republican candidate for Governor was constrained to withdraw from manufacturing by the unsatisfactory condition of the business under the present tariff," and evidently believes that Rhode Island might as well perish by having too little tariff as by having too much.

It was stated in the *Evening Post* last week on good authority that the cost of the late strike on the Reading Railroad was about $1,500,000. It would be more correct to say that this was the cost of recovering the property from the Knights of Labor. No other outlay since the reorganization of the company has been half so judicious as this. Indeed, it may be said that all the other disbursements would have been valueless without this. If there had been included in the plan of reorganization an item like this:

For regaining control of the road.....$1,500,000

there would have been a great hubbub in the newspapers, and perhaps in the circles of high finance; but such an item would have been the very groundwork and indispensable condition of the whole scheme, as the event has since proved, for when the employees refused to move a carload of flour that came out of the "scab" warehouse, the Knights of Labor virtually laid claim to the Reading Railroad by "calling out" all the employees in order to support the hands who had boycotted the flour. This was a condition precedent to the reorganization. It was the underlying mortgage, the prior lien, of the whole series, and it had to be paid off. It is fortunate that it was no larger in amount than $1,500,000.

The spreading of the railroad strike at Chicago, Milwaukee, Kansas City, and Indianapolis is the natural consequence of the timorous behavior of the railway officials. Instead of planting themselves on the law, and declaring that they would obey and ful-

fil the law though the heavens should fall, they said virtually that they would not obey it until compelled to by the sheriff. When the enginemen took the grotesque position that the moving of "Q." cars was a violation of neutrality (when, in fact, the non-moving of them was an express violation of a statute of the United States), the connecting roads gave a tacit assent to this doctrine. One of them, the Rock Island, gave its assent in writing. They thus gave the leaders of the strike encouragement to suppose that they could do anything. They supplied a firebrand to burn down their own houses. They are responsible for all the mischief that has followed the Burlington strike. The only way to end the trouble is to resolve now that they will obey the law and make everybody in their employ obey it. To this complexion they must come at last, and the sooner they come to it, the sooner will they see daylight through the present gloom.

If a man of whom the public knew nothing except that his name was Peck were to write a book and call it 'Peck on Labor,' he would find it pretty hard to get a publisher to take any risk in bringing it out. In fact, he would almost certainly have to pay the cost of manufacture and advertising himself. Well, we have a man named Peck, of whom the pub lic really knows nothing except that he is Peck, and has been selected by Gov. Hill for the office of "Commissioner of Labor Statistics"; and he has produced a book of which the proper title would be 'Peck on Labor,' but he does not pay the cost of printing and publishing it himself. He abuses his office of Commissioner by issuing it in the form of a "report," and making the taxpayers foot the bills. His proper business as Commissioner is to collect statistics, but, forgetful of this, he stuffs his book full of Peck views on labor and capital, and the general condition and needs of human society in general. His figures, it is true, frequently refute his arguments, but this is a difficulty which makes little impression on the Peck mind. He would probably say that the arguments can stand it, if the figures can. It is very mean of Peck to put so much of himself into a public document. He ought to make his mark as a "thinker" and economist in a series of books entitled 'Peck's Works,' before asking us all to bring out his essays at our expense. Of his last book we will only say that it is not any sillier than the one he published last year. It speaks well for him that he still keeps what little sense he ever had.

Attention has been drawn lately to a bill before the Legislature, and favorably reported, to revolutionize the prison system of New York. Whether this bill is in the interest of Labor or of the lunatic asylums, we do not know. It may partake of the nature of both. On the side of Labor it provides that no prisoner shall be compelled to work more than eight hours a day. "The remainder of the time," it says, "shall be devoted to such repose, exercise, study, mental and moral improvement as may be designated and required by the superintendent, warden, keeper, or other officer or officers having the control and direction of such convicts, and with a view to their reformation; and if for any reason a convict be not employed during such time, he shall be compelled to take needful exercise, in the yard or corridors of his place of imprisonment, or in such other place as may be designated, for at least two hours a day." It provides, also, that no motive power or machinery of any description shall be placed or used in any prison, jail, or reformatory in the State for the purpose of increasing the revenue or products thereof. It proposes to introduce the Georgia system of outside-gang convict labor, by employing the prisoners in agriculture or in draining and reclaiming swamp lands. Permission is granted also to employ convicts in building or repairing their own prisons and in manufacturing articles needed in prisons. This latter provision has not received proper attention, for it must be evident that if prisoners are allowed to make their own clothes, they will deprive tailors of employment; and if they are allowed to build and repair prisons and jails, they will compete with stone-cutters, masons, plasterers, etc. And this provision is quite needless, too, for if they are to be taken out in chain-gangs and set to work cultivating land, or digging ditches, there is certainly land enough owned by the State to keep them all employed, especially if they do not work more than eight hours a day.

Other provisions of this interesting measure are that no person convicted of felony shall hereafter be confined in a county penitentiary (there are six county penitentiaries in the State in which felons are confined), but all shall be sent to the State prisons, and that every person convicted of a misdemeanor punishable by imprisonment shall be imprisoned only in a jail or penitentiary within the county where the offence was committed. The effect of this would be to empty the six county penitentiaries, and to require the State to build new prisons furnishing an equal amount of room, and to require the remaining forty-four counties to enlarge their jails to meet the full requirements of their own prisoners of every grade below that of felony. The just and appropriate comment of the Prison Association upon this clause of the bill is, that "when the county jails are universally denounced as hot-beds of crime and a disgrace to our civilization; when the demand for their utter extinction and the substitution in their place of something better is loudly made by all intelligent men who have given the slightest investigation to their evils, the proposal to actually enlarge their sphere and importance shows an audacious disregard of the best sentiment of the community." Of the measure as a whole, they say it will "destroy the penitentiaries, will impose great and sudden expense upon many counties and upon the State, and inflict permanent injury on the cause of prison reform in the State of New York."

The full text of the composite Ballot Reform Bill which has been drawn by the Judiciary Committee of the Assembly is a very different measure from what the Chairman's outline of it led us to expect. It does not provide for separate tickets for each political party, but groups under the party name the candidates of each party for each office, and prints all the names of the candidates of all parties for the same office upon one ballot. This is unobjectionable, as it can in no way lead to party espionage at the polls. Neither does the bill provide for each party to have a ballot clerk at the polls, but simply names two ballot clerks at each polling-place to be appointed as election inspectors are now. This is the simplest and best way. There is also a provision for individual nominations, but it needs amending in a slight particular, and then will be entirely feasible and satisfactory. As it stands, it seems to imply that petitions for nominations must be signed singly, rather than in duplicate, for only a single certificate of nomination is mentioned. This can easily be remedied by inserting after the words "certificate of nomination" the words "which may consist of one or more writings." This phraseology has been adopted by the framers of the proposed Massachusetts act, and is of great importance. The provisions for the official marking of ballots and for secrecy in voting are all excellent, and the bill as a whole is a most desirable measure. We sincerely hope that the Legislature, acting in the same public-spirited and non-partisan manner as the Judiciary Committee have done, will pass it without delay.

The State-rights issue reappears in a novel form in Iowa. A law of that State assesses taxes upon the property of the Pullman Palace Car Company in Iowa. The company for three years has fought against this law within the State by such devices as enjoining every county treasurer. This year they have appealed to the Federal courts, and secured an injunction from Judge Brewer of the United States Circuit Court at St. Louis, requiring the Governor of Iowa and his Council to appear before the court in St. Louis and show cause why they should not be perpetually enjoined from assessing the company's property for taxation. The Governor and Council have decided to ignore the order of the Federal court and levy the tax, and the question now is what the Judge will do about it. Meanwhile, the Republicans of Iowa are beginning to develop a great admiration for State rights, and the Burlington *Hawkeye*, a good party organ, thinks that "this is as good a time as any to revive popular demand for a just limitation of Federal control of local affairs."

Texas is having a unique experience. For months past a surplus has been piling up in the State Treasury, which already reaches about $2,000,000, and as the Legislature only meets regularly once in two years, the Gov-

ernor is forced to call an extra session to dispose of the existing surplus and readjust taxation so as to prevent the development of another. Texas, it is well to remember, is a State which was awarded $4,000,000 out of the United States Treasury by the "Bill to Promote Mendicancy," on the ground that it was too poor to educate its children alone, and must have help from Washington.

It is becoming more evident every day that some kind of a Training School for Republican Editors will have to be founded to meet the growing demand for organs that can be depended upon. There is scarcely a State in the North in which a want of this kind is not felt. Both the spirit and the education of the time appear to be in a "combine" against making editors of the sort needed. The wicked colleges are all teaching that protection, unlimited and unrevisable, is not a sacred thing. The tendency of the youth of the period, under the influence of intellectual leaders, both inside and outside of the colleges, is to drift towards tariff reform, towards liberal ideas in politics, and to take such a cheerful view of even party lines as not to be either charmed or frightened by a party name. As a natural result of this condition of things, Mugwumpism is cropping out in the newspapers everywhere. It is hard to keep that profession from catching something of the general infection. When the air is full of Mugwumpism, even an editor cannot help inhaling some of it. The trouble with it seems to be that when a man gets some of it into his system, he never fully recovers from it. He is in danger of "kicking" at the very moment when the party most needs his help. The only remedy which we can think of is a training school with so thorough a high-protection, straight-party course of study that it will turn out a select band of editors, warranted to stand by the party till the crack of doom.

Our esteemed contemporary the *Mail and Express* has introduced a new feature in journalism, which cannot be too highly commended. The wonder is that nobody has thought of it before. It begins the editorial page every day with a text of Scripture, as thus:

IN THE BEGINNING GOD CREATED THE HEAVEN AND THE EARTH.

One of our esteemed contemporaries prints Premier Mills's name Roger P. The *Tribune* should mind its P's and Q's more carefully.

AND GOD CREATED MAN IN HIS OWN IMAGE, IN THE IMAGE OF GOD CREATED HE HIM.

The Boulanger case did not take very long in trial. Ten minutes is a short time in which to present the defence, and the judges do not seem to have taken much longer to reach a decision.

This is a decided improvement on the *Herald's* practice of scattering through its editorial and news columns, in a heterogeneous way, quotations from Byron and other profane poets. A great deal of good may be done to a heedless, hurrying, and sin-ruined world by presenting to newspaper readers suddenly short passages from Holy Writ, which they might not otherwise ever see; and we know, in regard to the texts chosen by the *Mail and Express*, that the wayfaring man, though a fool, need not err therein. So much cannot be said for the miserable scraps from Byron's "Corsair" served up to us by the *Herald*.

The difficulty the Sophomore Class at Columbia College is said to experience in giving up the custom of burying, or "triumphing over," Legendre, is a curious illustration of the hold of traditions, even on the youthful mind. Hostility to a text-book or to a subject of study, finding expression in public demonstrations of joy at getting rid of it, is so distinctly a childish or schoolboy feeling that one would naturally expect that a young man on entering a university would be rather ashamed of it, as of a love of marbles, or peg-tops, or hoops. But it has survived at Columbia to this day, in spite of the growth of the College in numbers and the rise of the standard of age. This year it was even proposed to get up a steamboat excursion, and have "the burial" at sea, with the accompaniment of "free beer"; and the College paper, the *Spectator*, resented sharply an attempt on the part of some parents and professors to substitute for this celebration the annual bestowal of a prize for excellence in Legendre. According to the latest accounts, the steamboat excursion and "free beer" had been given up, and it was proposed to substitute a torch-light procession through the streets. We wonder whether the youths who are to take part in it, who are presumably from eighteen to nineteen years old, and have in most cases the advantage of coming from homes of more or less cultivation, have ever considered what must be the effect on the rest of the community, and especially of the youths who cannot go to college, of seeing a whole sophomore class parading publicly by way of expressing their detestation of study. These unspeakable sillinesses suggest the question whether it is not unfortunate that undergraduates continue still to be known in this country as "college boys."

As we remarked the other day, there appears to be little doubt that the Tories in England have for the moment "dished the Radicals." They are putting through or promising large measures of legislation on Liberal lines. In other words, they are dealing with the leading questions of the time much as Gladstone might be expected to deal with them, barring the Irish question. Goschen's conversion of the 3 per cents is one of those strokes of finance to which nobody has been supposed equal for the last twenty-five years but Gladstone. The County Government Bill, too, is very much such a one as the Liberals would have drafted, and there seems to be every sign that it will pass much in its present shape. All this is simply a repetition of the policy of the Tories ever since Peel's day. When they get into power, which they never do except by a sort of accident, they try to keep it by adopting the Liberal policy. In 1874 Disraeli made the mistake of supposing that the country was disgusted with Liberalism, and that he might go back to the old Tory ideas; the result was the brilliant foreign or "Elizabethan" policy, as Lord Salisbury called it, which came to such a disastrous end in 1880. That Lord Salisbury has learned wisdom by that venture is, however, plainly shown by his extremely cautious foreign policy to-day. It is, in all its main features, thoroughly Gladstonian. The question is now rising to many lips in England whether, if the Ministry succeed with the Local Government Bill, they will not attempt to solve the home-rule problem also on the Gladstonian lines, and thus be able to go to the country in 1892 with a yell of triumph. There is certainly nothing improbable in the supposition. They are ready to swallow anything that is plainly necessary to keep office, on the theory that it matters little what is done, provided it be done by the right sort of men.

Gen. Boulanger, having been placed on the retired list, has begun to run for the Chamber, and has issued an address. His programme is nearly as extensive as McGlynn's. His election is to be "a protest" against "the impotence into which the Government and Parliament have fallen," and a proclamation of the "necessity of upholding the national dignity and the integrity of French territory." If the Government and Parliament have really fallen into a state of impotence, and the national dignity and the integrity of the territory are really in danger, it will of course require almost superhuman exertions on the part of one man to set things to rights—a consideration which apparently has not occured to the General. So, also, it does not appear to have occurred to Dr. McGlynn that if the unintermitting efforts of the entire human race, from the dawn of history down to our own time, to abolish poverty have failed utterly, the task must be one to which no one man, or even society, would be equal. In fact, the mere contemplation of the load which both Boulanger and McGlynn now carry is enough to give the ablest and most industrious of us a genuine heartache.

The defeat and resignation of the French Ministry on so serious a proposal as the revision of the Constitution, made by a Boulangerite deputy, coming so close on the Grévy trouble, is another proof of the depth of the demoralization into which French politics has fallen. The division of all the parties in the Chamber into minute fractions not only explains how these ministerial crises are brought about, but perhaps, also, why they do not do more mischief. The "groups" unite readily enough to overthrow cabinets, but they cannot unite on any constructive policy, and thus the Republic, as the thing that is, remains intact. Boulanger's campaign, which assails the very form of the Government, will indicate pretty clearly whether the country districts are yet infected with the Parisian folly. A dissolution of the Chambers is doubtless not far off.

THE ADMINISTRATION AND INDIANA.

MR. W. D. FOULKE, the President of the Indiana Civil-Service Association, went before Mr. Hale's Committee in Washington last week, and informed it that he made extensive investigations into the condition of the civil service in that State in 1885-6, and sent the result to the New York *Nation*, but that "that distinguished organ of Mugwumpery, for reasons unknown to him, had never published the facts." Well, we will now inform Mr. Foulke that the reason we did not publish "the facts" was, that we had not complete confidence in the collector. We knew nothing of Mr. Foulke's capacity as an investigator, and doubted his disinterestedness.

What the *Nation* thinks about the course of the Administration, either in Maryland or Indiana, has never been concealed. The President's mistakes in both States have been very serious. They have been based on the idea, which we believe is President Cleveland's own, that the civil service ought to be reformed on a sort of local-option plan—that is, that in States in which the reform sentiment was strong, the spoilsmen should be resisted, but that in States in which the reform sentiment was weak, they should be allowed to have their way. The result has been, both in Maryland and Indiana, a most shameful demoralization of the public service, which the President has witnessed with a calm born of the belief that only in this way could his party be educated up to the point of supporting reform everywhere. He has confined himself to the execution and careful extension of the existing Civil-Service Law, to the retention until the expiration of their term of the great body of Republican officers who were not covered by the law, and to reducing, considerably below what has been customary, the number of dismissals among those who held at will.

That this is not what he promised when elected, and that it is not what Mugwumps and other reformers expected when they supported him, we fully admit. Moreover, that it has been, as a mere matter of party policy, a very great blunder, we have not the smallest doubt. We believe that the loss of Indiana to the Democrats next fall has been made very probable by the scandals and abuses in the Government service which the Administration has permitted or connived at. We believe, moreover, that the hold of the Democratic party on the Government will never be made secure, except through the adoption of the civil-service-reform policy, without ifs, or buts, or exceptions. It is not a matter on which any President can long stand up before the American people crying "Good Lord" in one State and "Good Devil" in another, promoting purity in one place and giving rascals full swing in another fifty miles away. The thing is absurd on its face. "Horse sense" is enough to kill such a policy, even if love of righteousness did not do it.

A public journal has, however, two duties towards its readers. To aid them in forming opinions about the events of the day is one; to advise them what to do in politics under any given set of circumstances is another. We see clearly enough wherein President Cleveland has fallen short of the promise of his prime in the matter of civil-service reform, but we do not yet see clearly how the matter is to be remedied. It would be difficult to say what ought to be done, even if a reform of the civil service were all that was needed at this juncture to make the American people prosperous and happy, and if either of the great political parties were heart and soul in the work. But we all know that we have before us another question fully as important as the reform of the civil service, namely, the reform of the tariff, and one of more pressing interest to the bulk of the people. We know that our present surplus is a fountain of corruption, to which for depth or volume the spoils system can hardly be compared. We know, too, that little as the Democratic party cares for civil-service reform, the Republican party cares still less, because it makes no pretence of producing a President who will in that field do even half what President Cleveland has done. We know that the criticisms of all the Republican leaders and newspapers during the past three years on the President's shortcomings have been charges not of malfeasance, but of hypocrisy. They attack him for having failed to reform the civil service, but admit, with the utmost brass, that had he given the spoilsmen full swing, they would have had nothing to complain of.

We know, too, that practical politics consists in every country, since the fall of Adam, in the choice not between perfection and imperfection, but between two degrees of imperfection. President Cleveland is not all that we could wish him to be, and every sensible man will keep scanning the horizon during the next seven months for the appearance of something better. When anything appears, we promise to let our readers know. When we see a candidate who bids fair to be more of a reformer in all directions than President Cleveland, and a party which seems to be more devoted to all the great ends of Government than the Democratic party, we shall announce the fact, without fear or favor. We confess we discern no sign at present of anything half as good as President Cleveland just as he stands, with all his imperfections on his head.

The government of a great country, we must remind some of our readers, is not child's play. You cannot throw an instrument aside, and then go home and go to bed. Whenever in the great game of politics you reject one man, you must then and there choose another, and you cannot choose without comparison.

POWDERLY'S DESPAIR.

MR. POWDERLY has issued a very despondent address to the members of his order of Knights of Labor, the sum and substance of which is that the policy of promoting strikes among laborers which they have pursued during the past two or three years, has been a terrible mistake, and has produced nothing but misery; and that they must now, if they want to be happy and prosperous, go back to the original purposes of the organization, and use its funds in educational lectures and discussions. In fact, "a vigorous policy of educational work" is what he now wants, and is what, he maintains, he has always wanted. He says "from the 5th of September, 1879, he has written and talked against and opposed strikes." It would, we think, be very easy to dispose of these statements by means of the deadly parallel, but we are not interested in exposing Mr. Powderly's inconsistency. Whatever he may have said at other times, he is now talking like a sensible man, and yet his manifesto is a pitiful confession of weakness and incapacity, to come from one who was dreaming two years ago of organizing a society of manual laborers which should instruct capitalists in the management of capital, lawyers in the practice of the law, and statesmen in the conduct of the Government.

No matter what he may have ever said or written against strikes, he is indirectly responsible for their multiplicity during the last few years, in that he led his followers to suppose that he had created a new instrument of extraordinary power, which would bring all people who did not work with their hands to their knees before manual laborers, and finally give manual laborers the control of the industry of the country, and even of the Government. He created, too, and laboriously diffused the impression that manual laborers are a class apart from the rest of the community, with interests different from and opposed to those of people who do not work with their hands, or have saved money, or made it in trade, or commerce, or manufactures. In other words, he has been the apostle of a subtle or disguised sort of anarchy, many times more mischievous and dangerous than the variety preached by John Most. When he had created this impression, his dupes naturally went to work to try the new machine, to "show their power" to the capitalists and the Government, and "put Labor on top." It has taken five or six years to work out his experiment, and it has been a terribly costly one. It has caused untold suffering among the working classes, has directly wasted hundreds of thousands of dollars of their money, and, indirectly, millions of the capital on which they have to rely for employment. If Mr. Powderly be a man of any moral elevation, the sight of his seven years' work must fill him with poignant remorse. He does something to expiate his offence, however, by publishing the confession of discomfiture which appeared in Thursday's papers.

A good many people will probably now ask us what, since Powderly's plan is a failure, is to be done to prevent this continual strife between labor and capital, and prevent these incessant and ruinous strikes. We recommend those who ask this question in good faith to sit down and read the history of the great strikes of the past seven years before they call on us for an answer. They will find that every one of them was

due in great part to the ignorance and excitability of the workingmen, and the readiness with which they are governed by determined and unscrupulous agitators. In hardly one do we discover a solid business grievance at the bottom of the trouble. In not one do we find the strikers proposing any remedy which would not virtually take property out of the hands of the owners, and destroy the discipline under which large bodies of men engaged in a common enterprise must live in order to accomplish anything useful.

The demands made on the corporations, too, by outside critics, in the matter of conciliating Labor and making it contented, seem not much more reasonable than those of the Knights. Even Prof. Hadley—a most competent observer—called on the railroad companies the other night, at the Commonwealth Club, to put at their head, for this purpose, "leaders of men" instead of "leaders of dollars"; as if either leaders of men or leaders of dollars could be had by advertising, as if they were not both among the scarcest products of the globe, as if the railroads did not all do everything in their power to get hold of men of the highest administrative capacity, and as if their failure to do so in some cases were not one of the commonest experiences of all human organizations. Lamentations over the shortcomings of railroad presidents and mining presidents are simply part of the eternal wail of humanity over the badness of generals, the short-sightedness of statesmen, the wrong-headedness of judges, and dishonesty of bank cashiers. One of the few uses of the Knights of Labor has been the illustration the history of the order affords of the difficulty of filling responsible places with the right sort of men in the present condition of human nature. Those members of the order who are dissatisfied with their General Master - Workman, their General Worthy Foremen, and their Outside Esquires, now "know how it is themselves" in the matter of discovering great men and setting them to work for the public benefit.

The truth is, that at the bottom of our labor troubles are simply the ignorance and irresponsibility and want of business training of the laboring class, and for this there is no remedy but time and patience and education. Even Powderly begins to see this, and confesses it. If any one asks us why we have so many railroad strikes, we answer by asking why there are so many revolutions in Guatemala. If the men who want to take the Reading or C., B. & Q. Railroad out of the hands of the present management were in a majority among us, we should have a political revolution, or an attempt at one, after every election. We must be patient with them, and bear as well as we can the loss their folly and blindness inflict on the community; but let us have done with quackery.

AN OBJECT LESSON IN TAXATION.

Among current tariff discussions we note a revival of the argument that it is folly to remove duties on imports, as the benefit will accrue to the foreign producer and not to the American consumer; and the repeal of the duty on coffee, and the subsequent events, are advanced as evidence that the argument is good. Senator Edmunds, in his *Harper's Magazine* article, lays stress upon this example, and others go so far as to say that no sooner was the import duty repealed by the United States than Brazil imposed an equivalent export duty. A slight examination of facts will show that neither assertion has any real basis.

Before 1862 coffee was imported into the United States free, but the war tariff imposed a heavy duty. The Brazilian planter believed himself ruined, prices fell suddenly, and predictions were made freely that the planter would have the bulk of his crop thrown upon his hands, and must dispose of it at less than cost. These fears proved groundless. Owing to heavy purchases of the United States for supplying its troops with coffee, the consumption did not materially decline, and the market recovered its normal condition. In 1867, when the finances of Brazil were thrown into disorder by the war with Paraguay, and every available source of income was utilized, an export duty was levied upon *all* exports, coffee being the principal one. The rate of duty was fixed at 9 per cent. on the custom-house valuation; and in addition to this imperial tax, the province in which the coffee was produced collected another tax varying from 4 to 7 per cent., the rate differing among the provinces. It is easily seen that fiscal necessity was the basis of these taxes. Brazil had no direct taxes; it still has no direct tax on land, though cabinet after cabinet has recommended such a tax, not only for revenue purposes, but to make unprofitable the holding immense tracts of land in an uncultivated condition. The whole prosperity and economy of the nation was based upon coffee; and today it is coffee that supports the provinces, the railroads, the empire, and the great mass of the population. The point to be emphasized, however, is, that Brazil imposed an export duty on coffee long before the United States seriously considered a reduction of the import duty.

These facts were well known in Congress when, in 1871, the duty was reduced from 5 to 3 cents per pound. Mr. Partridge, then Minister to Brazil, had reported: "It is safe to say that there is very little (in my opinion, no) hope of inducing them (Brazil) to reduce the export duties" on coffee and rubber; and he sent an elaborate table of prices for two years, showing that the export duty amounted to about 13 per cent. on the value of the coffee. In 1873, the duty on coffee in this country was abolished, but, under pressure of the financial crisis of that year, it was proposed to restore it to enable the Treasury to meet the requirements upon it. In the same year, the Brazilian Treasury showed a small surplus in the estimates, and an attempt was made to reduce the imperial export duty from 9 to 7 per cent., a move that was defeated by the Legislature's voting to increase its own salaries. Is there any evidence that Brazil sought to secure advantage through the action of the United States?

But, it is said, the planters at once raised their prices, and so the American consumer derived no advantage from the reduction of duty—as though a seller who does not possess a monopoly, can raise the price of his goods arbitrarily. It is true that prices did rise, and that they did rise by about the amount of duty; but it is a great mistake to assert that the rise was an immediate result of the repeal. The table of prices prepared by Mr. Partridge shows that the rise had begun in 1871, and that the average price in December, 1871, was quite as high as it was in the latter part of 1872. Coffee (Rio) that was worth 9 cents in January, 1871, had risen to 13½ cents in December, to 14 1-3 cents in January, 1872, and to 14.7 cents in December, 1872. In 1869 the import value of coffee was 9.8 cents, under a duty of 5 cents per pound; in 1872 10.9 cents, when the duty was 3 cents; and in 1873 14.4 cents, when the import was free. Of course the planters benefited by the rise, but through no action of their own. The fact that prices could be maintained in the face of such a reduction in duty only shows that the demand kept up with the supply; that the real equilibrium of the markets had not been altered. This is shown by the fact that Ceylon coffee, of which little is consumed in this country, also began to rise in 1870, and reached its highest point in 1874, at the time when Rio in New York had risen to 19.4 cents per pound—a rise so great that the duty removed becomes too insignificant a factor, and short crops and speculation must explain it. Rio on the London market passed through nearly the same fluctuations as in New York, yet there was no change of duties to affect the price.

It must be remembered that in the same market there can be but one price for one commodity, and it would argue an absurdity to suppose that a French or English merchant could purchase coffee in Brazil at a price lower or higher than an American. Had the United States been the only market for Brazilian coffee, and had the relation of demand to supply remained the same, the removal of the duty would in the end have modified the price, and certainly in favor of the consumer. But both of these conditions were absent, and although imports increased rapidly (with a few fluctuations), they were not able to overpass the demand. Further, it was not until 1882 that the import value of coffee in New York fell to what it had been previous to 1872. To suppose that Brazil planters had been able to manipulate the market for so many years in their interest and at the expense of the consumer, is to disregard the most common maxims of trade.

Under these circumstances, it is absurd to attribute the condition of the market to a mere shuffling of duties, whether duties on imports or on exports. In 1882 Brazil reduced the export duty from 9 to 7 per cent., but the provincial duty remained unchanged. The prices were 12.5 cents in 1881, 10 cents in 1882, 8 cents in 1883, 7 cents in 1886, and 10.7 cents in 1887. Is the influence of the duty apparent? That the re-

moval of the import duty by Congress was an advantage to the American consumer, may be shown by the fact that he would otherwise have been compelled to pay the market price of the coffee and a duty besides.

SILVER TOMFOOLERY IN THE SENATE.

NOTHING more discouraging or more unexpected has turned up in the struggle to get rid of the Treasury surplus than the apparent determination of the Senate to fasten upon the Bond Purchase Bill measures for currency inflation and for juggling with silver. Senator Plumb's amendment introduces a new kind of money into the multifarious currency now existing, viz., Treasury notes which are not legal tender except to and from the Government and from one national bank to another. As an oddity in finance, however, this is surpassed by a scheme which Senator Stewart of Nevada has offered as a new amendment, and which proposes to make Government warehouse receipts for silver bullion legal tender, and to require the Government to issue such receipts to all depositors of silver bullion at the current market value of silver; the value to be announced by the Secretary of the Treasury twice each month, by computing the average price of silver during the fifteen days next preceding the announcement.

We remark, in the first place, that the present silver certificates are not legal tender. Consequently, the proposed warehouse receipts are not only different from anything else in our existing currency, or any other that the world ever saw, but they are to be invested with a higher character than the certificates now in circulation. The warehouse certificates are to be redeemed by the Government in gold or silver coin, at the option of the Secretary of the Treasury. This makes the Government the buyer of all the outstanding warehouse certificates whenever the price of silver falls below the price at which they were issued. If, for example, a million dollars' worth of silver is deposited when the price is 46d. per ounce, the holders will keep them as long as the market price is at or above 46d. But whenever the price falls below that figure they will be sent in for redemption. In other words, the Government will, in the language of the Street, issue "puts" on silver to all the world—not sell these "puts," but give them away for nothing; a very convenient form of speculation, and one which ought in fairness to be extended to the owners of all other kinds of portable property. In order that the Treasury may always be in funds to "redeem" these warehouse receipts, it is provided that the Government may coin the silver taken on storage in sufficient quantities to meet the demand for redemption. This simple device transfers the load upon the public in their character as traders and wage-workers. Without this proviso they would carry the load in their character as taxpayers. Mr. Stewart's plan is a roundabout method of insuring the price of silver to all owners and producers thereof in the four quarters of the globe, the United States being the insurer and getting no premium for the risk.

On the 8th of April, 1886, Mr. Bland got a test vote in the House on his bill for free coinage, and was beaten by a majority of 37. Whether he and his followers will accept the Stewart measure, if it ever reaches the House, is doubtful, since it involves an abandonment of the "dollar of the fathers" and the ratio of 16 to 1. It recognizes the market value of silver as the coining rate, the ratio to gold being now about 21 to 1. The real object of the measure is to "steady the market" for silver at the expense of the people of the United States. It must, therefore, be condemned as fraudulent.

Next in the list comes Senator Beck's amendment, which proposes to retire the present gold and silver certificates as fast as they are returned to the Treasury, and to issue hereafter "coin certificates," on the deposit of either gold or silver coin in the Treasury; also to require the Secretary to issue forthwith "coin certificates" for all the surplus gold and silver in the Treasury in excess of the $100,000,000 gold which constitutes the greenback-redemption fund. These coin certificates are to be redeemable in either gold or silver, at the option of the Secretary They are to be paid out for all Government obligations not made specifically payable in other kinds of money, but are not made legal tender. It is easy to see what Mr. Beck's whimsy is. He fancies that a law of this kind will abolish the distinction between gold and silver. But it will do nothing of the kind. The holders of gold certificates will keep them. There are $96,000,000 outstanding. As no more can be issued after Mr. Beck's bill passes, they will command a slight premium, or at least a preference sufficient to induce people to pay other kinds of money at the custom-house. The new "coin certificates" will all be silver certificates under a change of name. The issuing of coin certificates in place of all the coin in the Treasury in excess of $100,000,000 gold will not make the Government any richer. It will be poorer by the cost of engraving and printing the certificates. Putting this money into a new form will not get it out of the Treasury. The surplus will be just as aggravating as before, because more money will be coming in than goes out. We fail to see any point in Mr. Beck's measure, except as a shock to common sense (which is quite needless in his case), and a further scare to the business community, with consequent depression to trade and industry, of which there is more than enough already.

THE MINORITY REPORT.

THE report of the minority of the Ways and Means Committee assumes that the trouble about the surplus in the Treasury is altogether artificial, that it is of the President's making altogether, and that it might now be easily averted by applying the idle money to the "payment" of the public debt. "If," they say, "'the absolute peril' to the business of the country described by the President in his message last December as resulting from an existing and increasing surplus was imminent and well-founded, how easily he could have averted it by the purchase of outstanding bonds with the surplus money in the Treasury—a power which he possessed clear and undoubted under the act of March 3, 1881. To have thus used the surplus would have been direct and business-like, just what a prudent business man would have done with his idle money—called in his creditors and applied it to his debts. . . . If disaster results from the failure of the President to use the surplus now in the Treasury, as the law authorizes him to use it, in *payment* of our existing debts, and if the majority in the House, which alone can originate a bill to reduce the revenue, fails to send to the Senate a bill of that character, the responsibility will rest with them. The minority are powerless."

It is scarcely necessary to say to any well-informed person that this is a deliberate misrepresentation. Everybody knows that the bonded debt cannot be "paid" until it matures, and that the purchase of the bonds depends altogether upon the willingness of the holders to sell. The suggestion that the Government ought to do as private individuals would, *i. e.*, call its creditors together and apply its surplus to the liquidation of its debts, would be applicable to the receiver of a bankrupt estate who was able to pay something less than 100 cents on the dollar. It is not customary for a solvent man of business to call his creditors together at all. He simply pays his debts as they fall due by sending his checks to the holders of his paper. But did anybody ever hear of a merchant calling a mass meeting of his creditors and saying to them: "I wish to pay 125 cents on the dollar of my debts; will you be so kind as to appoint a committee to apportion the money ratably among yourselves, so that nobody may get less than 25 per cent. bonus on his claims"?

A report which carries in it such a manifest falsehood as this, is open to suspicion at every point. Consequently, we cannot be surprised to read a paragraph like the following:

> "If the majority desire to insure the handing over of our steel-rail market to our English rivals, the proposed duty of $11 will accomplish this purpose, unless the workingmen who are employed in producing the raw materials and finished products of our steel-rail works are willing to accept still lower wages than they are now receiving, and the railroad companies which transport the raw materials are willing to greatly reduce their freight rates. Have the majority any assurance that the workingmen and the railroad companies are willing to accept these conditions? Neither were heard before the Committee."

What are the facts here? Simply these, that American steel-rail mills are now making contracts at $31.50 per ton, without any change in the tariff; that the English price for rails is $20.50 on the furnace bank, and that if the duty were reduced to $11 per ton, not a rail could be imported, because the freight charge would still amount to an absolute prohibition. Add $11 to $20.50 and we have exactly the price at which steel rails are now turned out by the thousands of tons in western Pennsylvania.

But, says this precious minority report, "the supply of steel rails to the Pacific Coast is now in the hands of foreigners, because of the cheap transportation by water from foreign ports, the existing duty of $17 not being sufficient to enable our manufacturers to compete for that trade." This paragraph is the key to the whole report. It embodies the idea that the buyers of steel rails have no rights—that the consumer must in all cases be sacrificed to the producer. The issue is thus clearly presented. It runs through the report from beginning to end. No article is so necessary to the comfort of the people, nothing so indispensable to daily life, whether to the poor or to the rich, but that the buyers must pay tribute to somebody, and as much tribute as the producer considers an adequate profit to his business. It may be tin plate, which is hardly produced in this country at all, and of which we must have $16,000,000 worth every year, paying a bonus of nearly 34 per cent. on it, or it may be common lime for house building, which has been produced here since the days of the Pilgrims—all must pay a tariff premium to somebody. It must be paid not for revenue, but upon principle—the principle that the consumer has no rights. Nothing could be more explicit than the assertion and definition of this principle. It is in direct contravention of the report of the Republican Tariff Commission of 1883. It is a doctrine that will rend the party in twain, if not this year, surely within a very few years. As we write these words, the Minneapolis *Journal* of March 31 reaches us with a most solemn warning to the Republicans in Congress not to commit themselves to such doctrines, if they desire to save their party from defeat. Says the *Journal*:

"If the Republican leaders of the House were conscious of the real intensity of the feeling among Western Republicans in favor of the Republicans in Congress formulating a liberal tariff-reform measure, and placing the party on record in favor of an honest and intelligent reduction on the necessaries of life, they would not fail to submit some such proposition in Congress. They certainly cannot realize the true state of feeling among Western Republicans, or they would see the serious danger in pursuing the present policy.

"There is no excuse for it. There is no reason why the Republican representatives should not have drawn up and presented to the House, long ago, a measure which should stand as a clear and definite statement of the Republican position with respect to tariff reform. The failure to do so is the most serious aspect of the political situation. It is producing a feeling of restlessness everywhere among Western Republicans that threatens party disintegration. This is not stating the case too strongly."

The feeling described by this Minneapolis paper is not confined to Minnesota. The Western States are honeycombed by it. It is not confined to the West; even New England is torn by it. Tariff-reform clubs are springing up in Massachusetts and Rhode Island which cut across party lines with the utmost impartiality. The public mind will nowhere accept the dogma that the rights of the consumer are to be sacrificed to the producer, at the option of the latter and to the extent that he desires. This is the gospel of robbery. Any party that proclaims it will be annihilated sooner or later.

RECENT AMERICAN LEGISLATION.

No one who reviews the laws passed in the States and Territories of the United States during the past two years, can fail to be struck with the increased conservatism that marks the action of all the legislative assemblies; save only when such conservatism would stand in the way of some interest, real or supposed, of the laboring class, or would check that movement which is said to embody the rights of women. The most reactionary by far of these conservative measures is a stringent statute against the holding of land by aliens. This is so notable and so little realized yet by foreigners, going, as it does in some Northwestern States, beyond the severity of the common law to unjust extremes, that it invites examination in some detail. It invalidates in some cases even the title to real estate already acquired, and the title of home corporations whose stock may yet be chiefly held by American citizens. It may even be stated broadly that *it is now unsafe for a foreigner to attempt to hold land in the West.* Five States—Illinois, Wisconsin, Minnesota, Colorado, and Nebraska—have passed such acts; while the new Florida Constitution and the Territories of Idaho and Arizona have adopted more liberal provisions, both of which latter, however, are now in conflict with U. S. S., 1887, c. 340. Under that statute it is in effect provided that alien persons or corporations may not acquire or hold land, except by inheritance or in the collection of debts, and that domestic corporations of which one-fifth of the stock is held by aliens, may not acquire or hold land at all in any of the Territories or in the District of Columbia. The same law in effect obtains in Minnesota, and in Wisconsin, except as to the provision against domestic corporations, and in Colorado; but the alien has three years in which to sell lands acquired by descent or for debt, and the statute applies to agricultural, arid, or range lands only. The law of Illinois is much more detailed, and stricter, in that it includes even land now already acquired, the alien owner of which has, however, his lifetime in which to sell the same, though only three years is given after foreclosure of a mortgage taken thereon, or, after his death, to his heirs; while in Nebraska, no non-resident alien can acquire or hold land either by purchase or descent; and if an alien now holding land shall die, the land escheats, and his heirs are to be paid only the value thereof, to be fixed by the judge, treasurer, and clerk of the county, the expenses of which appraisement, by way of adding insult to injury, the heirs are made to pay.

The next subject in which a reactionary tendency is shown is that of divorce. Except that in New Mexico new divorce laws have been passed, leaving South Carolina the only State in which there is no divorce, there are few States or Territories in which new causes of divorce have been enacted, and, in many, causes previously existing have been abolished. Thus, in North Carolina, a divorce is granted upon conviction for crime. In Oregon and Idaho the intoxication habit need be continued only one year to be cause for divorce; and failure by the husband to support the wife only one year in Idaho and six months in Arizona; and so desertion need last only one year in Oregon and six months in Arizona. But impotence is no longer a cause for divorce in Idaho and Arizona, nor intoxication on the part of the wife, in Arizona; adultery is a cause, in Arizona, only when the party is taken *in flagrante delicto.* In Oregon a divorce for crime is denied unless prosecuted within one year of the conviction; and in Arizona the "omnibus" clause has been repealed. In Rhode Island and Arizona either party may be a witness in divorce proceedings, and in Maine and Arizona either party divorced has now liberty to marry again at any time; but in Michigan the court may decree against remarriage during a term not exceeding two years. In New Hampshire alimony may now be decreed to the husband. In Arizona divorce from bed and board has been abolished.

Turning now to marriage, we find that it is no longer declared, in Arizona, to be a mere civil contract; but in Idaho, witnesses are no longer necessary. And in Arizona "all persons who have heretofore lived together as husband and wife and shall continue so to live for one year after July 1, 1887," are declared legally married. In Idaho, as in California, neither party is bound to a promise of marriage made in ignorance of the other's want of chastity. The age of consent is made, in New York and Arizona, eighteen in the male and sixteen in the female; and in Illinois and Arizona marriages between first cousins have been forbidden. In Arizona marriages between a white and a negro or mulatto, and in North Carolina marriages between an Indian and a negro, have been made void. In Idaho and Maine either party may marry again without being subject to an indictment for bigamy if the other has been absent and is believed to be dead; though in Maine such party must have been absent seven years.

When we come to the rights of married women, we meet the radical tendency. In Rhode Island and Oregon the woman's suffrage amendment was defeated; but in Massachusetts the office of overseer of the poor, and in Alabama that of notary public, may be held by women. Ohio, Idaho, Minnesota, Dakota, and Arizona have enacted laws changing the entire status of married women. Thus in Ohio and Idaho the California code is now followed, while in Minnesota and Dakota it has been enacted that "A married woman shall retain the same legal existence and personality after marriage as before, and shall receive the same protection of all her rights as a woman which her husband does as a man," and may sue or be sued; but this does not apply to voting or holding office. In Alabama and Ohio neither husband nor wife is liable for the acts of the other, as such. Pennsylvania and Alabama have also enacted new "married women's acts" as to their property and powers; and in these States, as well as Connecticut, Ohio, Nevada, and Arizona, the husband acquires no rights in the property of the wife. In all these, and also in Nebraska, New Mexico, and South Carolina, property acquired by the wife after marriage is her separate property. In Pennsylvania and in Idaho, married women may make wills as if sole; in New York conveyances or liens between husband and wife are made valid, and so, in Ohio and Alabama, as to all contracts between them. In Ohio and Arizona married women may make deeds without the husband's joinder, as if sole.

As bearing on the labor question, we find a great many States reënacting or enlarging their mechanics' lien laws. A most remarkable statute, unprecedented in common-law jurisprudence, has been enacted in Minnesota, that all labor performed by contract upon a building shall be a first lien thereon; and that *the fact that the person performing the labor was not enjoined from so doing is made conclusive evidence of the contract.* A legal holiday, called "Labor Day," has been created in Massachusetts, New York, New Jersey, Colorado, and Oregon. And many States have

made provision for arbitration, for weekly payment of operatives, payment in money and not in goods, etc., etc.

Florida is the only State which has recently adopted a new constitution, though it has been vainly attempted in Kentucky and Delaware. The notable points of the Florida Constitution are that it leaves out the civil-rights provisions, provides that negroes and whites shall not be taught in the same schools, and forbids their intermarriage, provides for married women's separate property, provides that members of Congress must have been five years resident in the State and ten in the United States, abolishes the office of Lieutenant-Governor, makes the judiciary elective and shortens the judges' tenure of office, in effect prohibits State debts, limits the amount of land granted settlers to eighty acres, allows local option in the liquor traffic, and gives the Legislature full power to regulate the duties and charges of common carriers, but prohibits their accepting free passes. Amendments must now be ratified by three-fifths of the elected members of each house; and amendments to the national Constitution may not be ratified by any assembly elected before they were submitted. In Rhode Island also there is a prohibition amendment; and it is pending in several other States.

The law of real estate seems to have reached a condition of permanent stability. Massachusetts, indeed, has enacted a noteworthy statute, that all conditions or restrictions in the grant of land shall be construed to be limited, except in the case of charities, to the term of thirty years only. In Connecticut foreclosure by sale is now allowed in the case of real-estate mortgages. New York, Connecticut, Rhode Island, and Illinois have prohibited the acquirement of easements for lines of telegraph or telephone; and in New Hampshire, Massachusetts, Vermont, and Connecticut an unnecessary fence six feet or more in height, erected maliciously or so as to obstruct the view of adjacent owners or deprive them of light and air, is actionable as a nuisance. The use of seals in conveyances has been abolished in Colorado, Idaho, and Arizona; and so, in New Hampshire, wills need no longer be sealed.

The laws of descent of property have been more changed. Thus, New Mexico has abandoned the old Spanish law and followed the Indiana statute, while Arizona has copied that of Texas. A notable tendency has been shown to abolish the estates of courtesy and dower (in New Mexico, Arizona, and Connecticut), or to make the estates of husband or wife upon the other's decease identical (in Ohio). Idaho prohibits the devise of more than one-third of the estate to charitable purposes, as in California.

In commercial law the new legislation has been very varied in subject, but not large in amount. The usual statutes prohibiting the fraudulent issue of warehouse receipts or bills of lading, and making them prima-facie evidence in the hands of the holder, and negotiable or transferrable by endorsement, on which a bill has lately been introduced into Congress, have been repealed in New York and adopted in the States of Virginia, South Carolina, Mississippi, and Arkansas. In Minnesota crop mortgages given before seed sown for more than a year ahead have been made invalid, but in Dakota liens on crops for seed advanced are authorized. In Wisconsin birds, beasts, and dogs have been made property and subject to larceny. In Pennsylvania and Idaho one who sells goods by sample is now held by statute to a warranty that the goods are equal to the sample; but in New York a partner is no longer liable civilly to any person injured for fraud in limited partnerships. Bankers are given a general lien, in Idaho, upon all property in their hands for balances due from the owner. In Michigan and Texas buying or selling of "futures" is made a misdemeanor, and in Michigan contracts or checks given for such "futures" are void. The legal rate of interest has been reduced to 6 per cent. in Michigan and to 7 per cent. in Nevada and Arizona; and compounding of interest is forbidden in Idaho. Stringent usury laws have been enacted in Mississippi, Idaho, and Arkansas; and in Alabama a banker is guilty of a misdemeanor who discounts at a higher rate than 8 per cent. In Minnesota any provision increasing the rate of interest after maturity, or after the note is made, works a forfeiture of all interest. In Pennsylvania the mortgagee is forbidden to contract for the payment of taxes besides interest; and in many Middle, Western, and Southwestern States new tax-codes have been passed which may work to the great and unjust injury of non-resident mortgagees. In fact the tax laws, together with lax foreclosure statutes, are what chiefly render Western mortgages unsafe, and not any general want of value in the Western real estate itself. But this subject is too large to be more than mentioned here.

It is pleasing to find that, despite our protective tariff, the nation is beginning to find that forests may be of more value than lumber. Bounties or exemption from taxation for the growth of trees have in the last two years been established in Connecticut, Pennsylvania, and Utah; and Maine, Connecticut, New Jersey, Rhode Island, Illinois, Pennsylvania, Kentucky, Tennessee, Nevada, and Idaho have established "arbor days," wherein those who do not go to base-ball matches may plant trees. And the extreme Western States continue laudably to provide irrigation laws.

Of general political interest there is not much. Ohio has discontinued its October elections, and Nevada has disfranchised Mormons. The anti-Mongolian laws in California, Oregon, and Nevada are continued. Notable election laws have been adopted in a few States and are pending in several more, but with these the readers of the *Nation* are already familiar. Connecticut, Pennsylvania, and Maine have had to adopt "standard" time, though the town of Eastport still riotously rejects this docking of a precious hour of its daylight.

In concluding, we may be glad to note that the codification madness appears to be checked. Only Idaho and Montana—Territories subject intellectually to California—have adopted a few further sections of the code now threatening New York. And no State has further presumed to "repeal the common law."

A COUNCIL OF WOMEN.

BALTIMORE, April 3, 1888.

WHEN the Empress Victoria of Germany, replying to addresses presented by a number of educational and charitable associations of which she is a patroness, availed of the occasion to declare her conception of a princess's duty, she epitomized the general opinion of their responsibility which is held by educated, thoughtful women the world over; certainly she strangely reëchoed the estimate and measure of that responsibility as stated and reiterated by numberless women at the International Council of Women which has been in session in Washington during the past week. The meagre telegraphic report quotes the Empress as saying that her "foremost and most sacred duty will be the care of her suffering husband; at the same time she is reminded that she has *other* social duties. The moral and intellectual education of women, the sanitary condition of the laboring classes, and the improvement of the facilities by which women may earn a livelihood, will constantly be before her—holding that the noblest vocation of a princess is an untiring activity in the work of ameliorating the condition of the classes."

If, in the above sentence, we replace the word *princess* by the more extended and significant word *woman*, the most cynical will have to confess that, from the royal lady on the throne of the youngest (and yet the oldest) European empire, to the thoughtful workingwoman who "represents" hundreds of female members of farmers' granges and labor organizations, earnest, conscientious women, if fairly judged by their own utterances and actions, hold but one ideal towards which to strive, no matter how diverse their stations, their training, their efforts, and their "views." This fact it is which gives value to the utterances of a first International Council of Women.

As one whose sympathies did not go out cordially to this feminine conclave, when it was still a "programme" merely, a report of the impression received and sympathy aroused by its work may not be unwelcome to readers of the *Nation*.

Whatever difference of opinion may exist between men and women, or between women and women, in regard to the political enfranchisement of women, it is impossible for thoughtful members of either sex, or any class, not to be interested in or curious in regard to the proceedings and tone of this "Council." Although called, organized, and I believe paid for, by the National Woman Suffrage Association of the United States, to celebrate the fortieth anniversary of the first Woman's Rights Convention, its special object was to bring together delegates from educational and philanthropic associations the world over, who should report to their fellow-workers in varied spheres their several aims, successes, and hopes. It was further expected that out of this preliminary conference would grow permanent national councils of women for the United States and other countries, and that from these national organizations would eventually be formed a permanent International Council, representing all women working in any *organized* movements for the elevation of the moral and the amelioration of the physical condition of mankind.

The active managers and many of the speakers were advocates of the extension of the franchise to women, but the programme of subjects covered the wide and human field of energy and reform included under the general divisions of Education, Philanthropies, Temperance, Industries, Professions, Organization, Legal Conditions, Social Purity, and Political Conditions. This list offered topics of interest sure to appeal to whole classes of women who, if not antagonistic, are certainly indifferent to the political privilege of the ballot. Indeed, with rare modesty—or wise self-restraint—the originators of the Conference named their own special hobby as the subject for the last day, and allowed every other existing or struggling cause to state its work done and explain its value before presenting what they claim as the open sesame to effective accomplishment of any and all moral, social, and political purification.

Without going into details, which have been, or will be, fully given by the daily press and by the organs of special causes and organizations, let us see if there are not lessons which a

wise outside public may learn—lessons which, if taken to heart, may be not unimportant results of this unique assemblage.

To make what follows clear to the uninitiated, it may be well to refer to the origin and composition of the first Woman's Rights Convention, of which this International Council of forty years later has arisen as a claimed and recognized sequence. Among the rejected women delegates to the World's Anti-Slavery Convention, held in London in 1840, were two Americans, Lucretia Mott and Elizabeth Cady Stanton, who then and there determined on their return to America to call a "Woman's Rights Convention." It was not until eight years later that these two, with Martha C. Wright and Mary Ann McClintock, issued, without signature, however, the circular announcing that "a convention to discuss the social, civil, and religious condition and rights of women will be held in the Wesleyan Chapel, at Seneca Falls, N. Y., on Wednesday and Thursday, July 19 and 20 current, commencing at ten o'clock A. M. During the first day the meeting will be exclusively for women, who are earnestly invited to attend. The public generally are invited to be present on the second day, when Lucretia Mott of Philadelphia and other ladies and gentlemen will address the Convention."

Gathered in a small interior town of New York State, this Convention was attended by a comparative handful of what the public called enthusiasts and fanatics. James Mott presided; his wife, Lucretia, stated the object of the meeting to be to consider the degraded condition of women, and the need of efforts for her education and elevation. The suffrage resolution was hotly opposed, and only carried by a small majority, on the plea that it seemed the key to all other reforms. The story of many successive Women's Rights Conventions must be disinterred from heaps of newspaper witticisms and sarcasm, with occasional notices of such *facts* as the grants to women of citizenship in two Territories, municipal suffrage in one State, and school suffrage in one-half of the States of the Union. The significant fruits of this persistent demand for the suffrage, however, are not those advances which have been made towards possession of the franchise, but the correspondingly much greater gains for women in all other attempts for the attainment of industrial and legal justice and equality.

Assembled in the capital of the nation, received by the President and his wife on the same terms as any other organized body of citizens, the Council just adjourned was composed of women from every part of our own country, from Great Britain, India, France, Finland, Denmark, Norway, and Sweden. The delegates represented thirty-nine partially organized associations, whose very titles emphasize the growth in public opinion, social freedom, and moral tone which has taken place in the past quarter of a century; professional, educational, or philanthropic work not so organized being presented by individual members willing to report on their particular "occupation." Ridicule must call a halt before the names of such women as Miss Frances Willard of the Women's Christian Temperance Union, the Pundita Ramabai, Mme. Bogelot, Director of the reform work of Prison of St.-Lazare, Paris, Miss Clara Barton of the Red Cross Society, Mrs. Sarah Cooper, President of the Golden Gate Kindergarten Association, San Francisco, or Miss Alice Fletcher, Special Indian Agent of the United States Government. Their work is independent of and superior to the suffrage agitation—which assertion brings us naturally to some reflections that can be merely outlined. If the facts justify them, any reader can amplify them as his or her sympathies dictate.

One cannot read the speeches of these women, and have felt the power of their earnestness, for two sessions daily, for one week, without feeling, in the *Nation's* own words, "that the talk, voluminous though it be, will do good, help to correct mistakes, and make some dark things clear." We think that both the facts and the theories presented throw enough light on "dark things" to justify—

(1.) The belief—that the political enfranchisement of women is not coming in this generation, at least.

(2.) The trust—that when it does come, women will be fairly well prepared to use it intelligently, and as a mercifully merciless lever whereby to further moral and social development, but without any serious rivalry with men for offices and political rewards.

(3.) The warning—to those men and women who are active or passive anti-woman-suffragists, that, in proportion as they wish to postpone the political enfranchisement of women, should they endeavor to bring about—the men by legislation, and both by public countenance and financial support—those reforms the accomplishment of which is the sincere and avowed goal of the suffragists themselves.

Give woman equal rights and opportunities in the universities, professions, and trades—protect her as child, wife, and mother, from the greed and lust of men—avail of her intelligence and sympathy in dealing with the deep problems which poverty and progress thrust on us for settlement—get rid of the idea (treating it as a survival, after all, of a legitimate but lower stage of development) of the "superiority" or "inferiority" of either sex—their "differences" will not be affected by opinion or legislation, and the right of suffrage will become either a dead issue or a natural sequence; in neither case much to be dreaded.

The social philosopher is privileged to draw some comforting convictions from this peaceful array of women, which, in spite of its sponsoring organization, testified, even by its most radical and righteous denunciations of existing conditions—

That the best energy of the best type of women finds its natural and congenial sphere in domestic, educational, philanthropic work, and will continue to do so;

That the great majority of those women who have devoted their lives to agitating the question of female suffrage have done so only because they believed the ballot was the short cut to justice and equality before the law for themselves and their children (for other women and *their* children), especially when this is needed for that saddest of all protection, legal defence for outraged womanhood, and against brutality towards innocent, helpless childhood;

That the Christian definition of "neighbor" is entering into the heart of women in a marvellous way at the present time—that a deep and earnest sense of duty and responsibility from women to each other and to the whole world around them is tending to infuse them as a class, and so fuse them into a mass to leaven the world;

That there is growing a feeling of universal kinship, a human fellowship in aspirations, an international bond of sympathies, the increase of a sentiment much higher and more generous than purely personal or local aims and rights—for while being the greater, it still includes the less.

Therefore we read without fear or foreboding that, before adjourning, an American National Council of Women was formed, and that with true national instinct they adopted a constitution, of which the following preamble states their "aims":

"We women of the United States, sincerely believing that the best good of our homes and nation will be advanced by our greater unity of thought, sympathy, and purpose, and that an organized movement of women will best conserve the highest good of the family and the State, do hereby band ourselves together in a confederation of workers committed to the overthrow of all forms of ignorance and injustice, and to the application of the Golden Rule to society, custom, and law."

The work cut out for women would be appalling did we not believe with James Russell Lowell that

"New occasions teach new duties; Time makes ancient good uncouth;
They must upward be and onward who would keep abreast of truth."

C. B.

THE CORSICANS OF TO-DAY.

PARIS, March 21, 1888.

PROSPER MÉRIMÉE wrote his best book, 'Colomba,' on his return from the Island of Corsica. When all his other works are forgotten, 'Colomba' will probably still be read. It was a sort of revelation. France hardly knew well the island which gave birth to Napoleon. 'Colomba' had and still has all the charm of a journey in a *terra incognita*. The historian of the Papacy, Gregorovius, has given an excellent account of Corsica, but, like Mérimée, he has been more seduced by the virtues of the Corsican race than shocked by its defects. Gregorovius is a man of imagination and of strong sympathies; he has treated the Corsicans in the same spirit as Lucretia Borgia.

I have before me a volume of letters on Corsica which were sent to a French paper by M. Paul Bourde, a travelling correspondent, who has the great merits of the modern school of writers. He is a sort of photographer, and does not pretend to any other merit than exactitude. It is rather curious to see that the same method rules now in all the fine arts. The motto of the modern painter is "to paint what he sees"; nature is really the only master. Our naturalists and impressionists wish to rob her of all she contains; they seem not to choose their subjects—they are, so to speak, chosen by them. No sculptor would dare, in our time, to model from his memory or his imagination; he must have before him a living object. The increasing importance of the press, the boundless curiosity of the public, has engendered a new class of journalists, who are also naturalists; they seem to hold no opinions, no doctrines; they go about the world and note everything. Their powers of vision are acute, their powers of judgment are but small; but they do not pretend to judge—the universe seems to them like a vast theatre crossed by fleeting forms; they are amused by the show and they wish to amuse us.

M. Paul Bourde is a little better than an "amuseur"; there is a little philosophy hidden in his descriptions. He has seen many countries and many men, he has described in graphic letters Cochin China, and Tonkin, and I know not what other countries. He was lately sent to Corsica, which had become the scene of curious disorders, and he formed his opinion on the spot as to the cause of these disorders. He is courageous and truthful, and, writing in a republican paper, he dares to say that if he has republished his letters, it is because "Corsica presents, in its acute form—that is to say, in the finest conditions for study—the example of an evil of which we are beginning to feel the first symptoms on the Continent. It is the interference of the Deputies in the ad-

ministration." He dares to say that, on the Continent, "the evil is checked by our moral habits. The electoral interests offend the scruples of conscience. Nevertheless, the progress of the evil is shown by the difficulty with which certain taxes are collected, by the impunity assured to certain frauds, by the multiplication of nominations made through complacency. In Corsica, thanks to the conscience of the clan, the laws are but a name. One-half of the citizens evade them with the help of their representatives, and they become mere instruments of vexation against the other half. There is no law, no justice: the administrators are inert for fear of endangering their position; the administered are persuaded, by daily experience, that nothing is done except by favor."

Would you see, by an example, how far the Corsicans are imbued with the idea that everything is done by favor? A young man had a wooden leg; he could, of course, not become a soldier. When the time came for him, however, to appear before the Council of Revision which decides on exemptions from military service, he did not think himself safe till he had procured letters of recommendation to all the members of this Council, and carried these letters to them. M. Bourde thinks that we, who live on the Continent, are a little better, in this respect, than the Corsicans. How does he explain the fact that M. Wilson, the son-in-law of President Grévy, kept carefully 22,000 bundles of letters, coming from 22,000 different persons, who had applied to him for various favors? It is M. Wilson himself who reported this number, and he did not seem to understand the importance of this extraordinary revelation.

M. Bourde is severe on the Corsicans; he is severe, also, on the French. He thinks that we have not done enough for the island, that we have left it too much to itself, a prey to brigandage and the vendetta; that we might have improved a brave and energetic people, worthy of a better fortune.

If you start at six o'clock in the evening from Nice, you arrive at six o'clock in the morning at Bastia. A few hours separate two worlds; is it France, is it Italy? "You know, at once, by people's manners, that you are not in Italy; and, whatever you may have thought hitherto, you find yourself in presence of a new character. If you ask a passer-by for an address, he takes you politely to the very door; and if you make the gesture for putting your hand in your pocket so as to pay him for his complacency, however poor he may be, he will leave you with an angry air. The Corsicans are very proud—a sentiment unknown in Italy, where the lower classes beg with effrontery." M. Bourde tells us little about the race, in the ethnological sense. In Bastia and in the seaports, where the influence of Pisa and of Genoa was most felt, people have black hair; in the interior of the island he found many red-haired. The original type was probably red. He went from place to place, travelling leisurely, and trying to penetrate the Corsican soul. The social organization reminded him of the Roman patriciate. Fifteen or twenty families have their clients, and dispose of all the influence, as they dispose of all the votes, in the elections. Such a family has a few hundred votes, another has two or three thousand. For centuries there was no central power; the island belonged to independent and rival classes. Even now, a Corsican prides himself on the number of his cousins; the larger the family, the stronger it is. The French rule has not destroyed this feeling, "because," says M. Bourde, "it has not destroyed the needs which created it. We have not been able to inspire confidence enough in the equity of our functionaries, nor in the justice of our tribunals. The Corsicans have not renounced defending themselves; they remain associated in order to protect themselves, and also to help each other in order to obtain favors or to avoid the obligations of our society. A Corsican who does not belong to a clan seems, in the eyes of his compatriots, a despicable object; he is a barren branch of the tree."

Let us enter into the house and the family of one of these chieftains of a clan. His house is large and adorned in the Italian style: no comfort, no carpets, no rich furniture; immense rooms in which you can hold meetings; great archives, where all the family papers are carefully kept; a voluminous correspondence of Paoli, letters of various Bonapartes before their elevation. How is this great family influence maintained? By the voluntary sacrifices of all the brothers to one. "You see my house," said one of these heads of a family to M. Bourde. "We were four brothers; only one married. We thus avoided the division of our lands and the breaking up of our influence. One of my brothers takes care of the property. I, who am the eldest, have the political direction. I give my life and I may say my fortune to my clients, and my clients give me their votes; this is our secret." In old times these clients would have made war for their chieftains, in our day they have only to vote. When the tax-gatherer torments a peasant for his taxes, the taxee goes to his chief, who advances the money. The *padrone* is the director of the conscience: he distributes money, influence, pleasures; he governs in his little world, and spends as much ingenuity and diplomacy as a statesman. Is it to be wondered at that, with such a state of things, agriculture is still as it was described by Virgil? It is very much as it is in Sicily. If the great proprietors wished to make any changes, they would have to derange and to hurt all sorts of vested interests, and they would compromise their political influence.

Here is an example of the importance of a clan. In the month of August, 1886, a special jury was appointed for the condemnation of the lands over which was to be built a railroad from Casamorza to Fium'orbo:

"This jury had been chosen in the Council General by a majority presided over by M. de Casabianca, the chief of the clan which is now the most powerful; then a selection was made by a tribunal presided over by the father of M. de Casabianca; and the deliberations took place before M. de Casabianca, a lawyer chosen by the company. It was truly a clannish jury, and it judged according to the conscience of the clan: what is good for friends is legitimate. M. Benedetti was deprived of a vineyard of 16 ares 96 centiares, and Mlle. Virgitti of a vineyard of nearly the same extent—18 ares 90 centiares. M. Benedetti is an enemy of the clan. The jury allowed him 2,000 francs, which was, however, a perfectly reasonable price. But Mlle. Virgitti is a relative; she obtained 13,000 francs. MM. Astima were also relatives; they were paid 35,000 francs for 1 hectare 36 ares 70 centiares of the wild land (*maquis*). Still another relative got 45,000 francs for 90 ares 51 centiares of maquis land."

On the Continent such partiality would have been deemed monstrous, in Corsica it was simply looked upon as a proof of the power of the Casabiancas.

Every year the same spirit is shown in the councils of revision which decide on exemptions from the military service. The Corsicans have the same taste as the Italians for small Government offices, little as these offices may be paid. An official becomes what the Italians call a *mezzo-galantuomo;* he looks down upon the tillers of the soil. They have instinctively a great aversion to agriculture. Every year 15,000 Italian laborers, who all go under the name of Lucchese, though they do not all come from Lucca, cross to Bastia in the autumn, and go all over the island, where they do the heaviest agricultural work. The Corsicans do the easiest work. They gather the olives and the chestnuts. "The peasant families which can lay by anything are rare exceptions; people live from hand to mouth. Every village has a fine square where the inhabitants spend the best part of their lives in talking politics—that is to say, the rivalries of their clans. Most villages are divided into two camps, two parties. One of my friends who was for some time in Corsica in the capacity of a *garde général* of the forests, told me that one Sunday he saw in a village church all the men with guns in their hands. The two camps occupied the two opposite sides; at the moment of the elevation of the Host, as all the men had to kneel, he heard the click of all the guns (which were loaded), lest the kneeling posture might become an occasion for firing."

M. Bourde has reckoned the cost to France of this singular island. He concludes that since the beginning of the century Corsica has cost France one milliard of francs. The fiscal laws are constantly evaded; the public works are all paid for out of the national treasury. For all that, France is not ready to abandon Corsica, feeling that the race which inhabits it is capable of progress. The Corsican soldiers are among the best in the French Army; and, besides, did not Corsica give us Napoleon? As his life is an indissoluble part of our history, his birthplace has become an indissoluble part of our country.

Correspondence.

SOUTHERN HOMICIDE.

To the Editor of The Nation:

Sir: It may have been mentioned in your columns, but, as I have not noticed the statement of the fact, I will call attention to it, that a pamphlet (written, I was told, by a late Governor of South Carolina, but published without the author's name being embodied), bearing the following title-page, was issued by Parry, Cooke & Co., Charleston, S. C., 1878: 'The Code of Honor; its Rationale and Uses, by the tests of Common Sense and Good Morals, with the effects of its Preventive Remedies.' At the close are given "Rules for the Government of Principals and Seconds in Personal Difficulties."

I was told about the pamphlet by a gentleman of the *ancien régime* of the Sea Islands, who married the only child of a once wealthy planter of the same region. He also told me that on his wedding day he received, as a present from his father in-law, a case of duelling pistols with a copy of this pamphlet on the Code.

The author sets forth as a fact that civilization has come through wars, and that "the great natural right of self-preservation is as full in individuals as in public bodies"; and asserts that

"when the cause is just, and the course of the duel is governed by humanity in vindication of justice, or for a rational defence of honor, it stands upon the principles of nature and the principles of Christianity, precisely as public war. And now the leading and most rancorous enemies to the Code of Honor are the materialistic Puritan sceptics of this country. Under the name and cloak of Christians they dethrone the Godhead of Christ, ignore the atonement, and dispense with faith. . . . In the arrogance of intense self-sufficiency they trample

under foot, as they choose, both the Bible and the Constitution. And they have no respect for the immemorial usages of persons of gentle manners and good breeding. . . . Their individual feelings are little vulnerable, and character and rights, being both venial and venal, require no risky defence. . . . So long as radical levelling does not reduce all to the semi-savage state of the social hog—so long as the gentleman is not eliminated from existence—until the advent of the millennium, the Code of Honor will be used."

As to anti-duelling laws, which abridge the rights of juries to investigate the facts and the animus of homicides resulting from duels, he says:

"They have been transplanted from the pernicious hotbed of Puritan scepticism, whose arrogant and intermeddling 'higher law,' humanitarian aggression has caused the slaughter of thousands of American citizens, and whose levelling materialism has taken profitable shape in systematic plundering of their victims under form of law. For fifty years all this class have raged against the Code of Honor. . . . They have shown their mortal hatred of the Code of Honor and their fear of the responsibility it enforces."

That "the Bible" and "the principles of Christianity" should be brought forward to support the conservation of slavery, war, and the duel, is not surprising, seeing that a canon of the Anglican Church said, when some people hurrahed for Gladstone, "You might as well hurrah for the devil as for Gladstone," and that, as it is said, a Conservative party cry in England was "Beer and the Bible." But there is a new South which would not sympathize with the English canon in perpetuating the union of Church and State, which strives to suppress intoxicants, and which frowns on the duel.—Yours, H. J. S.

MONTREUX, SWITZERLAND, March 13, 1888.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of March 22, Mr. James Wood Pogue, writing from Nashville, Tennessee, under the above heading, says: "As I am distinctly a Southerner and personally acquainted with several gentlemen who have recently figured in desperate 'affairs of honor, it may be pardoned if I submit a concise opinion on the subject."

Now, if the phrase "affair of honor" means anything, it means a regularly arranged duel. But, from the illustration employed by Mr. Pogue, it is plain that he is talking, not of duels, which are about as completely out of date in the South as in the North, but of street-fights, which rarely have about them even that semblance of "honor," or fairness, which was supposed to be the recommendation of the duel. I do not know where Mr. Pogue has made the acquaintance of the "gentlemen who have recently figured in desperate affairs of honor," as there has been neither duel nor street-fight between gentlemen in Nashville within nine or ten years. The case of Gen. Zolicoffer, which he uses as a text, belongs to ancient history, having occurred between thirty and forty years ago. Moreover, his account of it is wholly inaccurate, and there was no such display of "chivalry" as he supposes.

The writer is a native of Tennessee, who knows that Mr. Pogue's loose expressions will convey to Northern readers a most unjust impression as to the peaceful conduct and regard for law of the community in which he lives—and who believes that in these particulars it will bear comparison with almost any community, North or South. He therefore begs space for this correction. B.

SPRING HILL, TENN., March 25, 1888.

PRACTICAL POLITICS.

TO THE EDITOR OF THE NATION:

SIR: An article in the *New Princeton Review* with the above heading furnishes a pretext for another blow at the nail which cannot get itself driven. The sum of that article is that our platforms are mere generalities, to which the parties pay no attention, while they ought to be so definite as to be the standard of parties, and committees of the Legislature should see that they are put in practice; that our representatives are wholly impersonal to their constituents, who vote for mere names, without knowing anything about them, what they have done, or what they will do, and that every representative ought to give a public account of himself, either orally at district meetings or through the press; and, lastly, that our representative bodies are too large, that debate in Congress or the State Legislatures is impossible, while the conventions "are mere panicky hordes, the prey of intrigues and surprises, in which discussion is impossible, and whose decisions cannot be forecast." The remedy in this last particular is not quite so clearly set forth.

The root of all the difficulties thus pointed out seems to me to lie in the want of personality in our politics, and of this again in the exclusion of the executive branch from all share in the public guidance of legislation. If the Cabinet officers had seats and voices in Congress—and the same is just as true of State officers in the Legislatures, and city officers in the councils—whatever else might be the effect, it could not fail to work a change in these respects. In the first place, there would be no need of a platform. Supposing the parties to retain distinguishing names, even as unmeaning as Republicans and Democrats, they would soon find that their way to success would depend upon following leaders, and leaving to those leaders to formulate policies. The conflict of debate would soon take care that those leaders were strong men, probably the strongest of the party. The leaders, watching the current of opinion in, and still more outside of, Congress, would put prominent questions into shape, and, having the guidance of business in the houses, would see that they were taken up in order and in good season to be debated publicly, instead of disappearing in the inextricable confusion of thousands of bills in separate and secret committees.

If this was the effect upon business, it would be quite as great upon the representatives. The reason why these are unknown ciphers to their constituents is, that their work is so indefinite, so purposeless, and so secret. Members of Congress disappear at once in committees. Not one in ten of them knows how or why anything is done, and those who do know are by no means anxious to tell. How can a member make report of such things to his constituents? He might as well try to explain the changes of figures in a kaleidoscope. But if measures were taken up in order, in full Congress, under the guidance of leaders, the speeches and the votes of the member would establish his political position, while he would have a plenty to talk about to his constituents in explaining to them what would have already excited their interest in the papers.

Not less would be the effect on the representative bodies. Whereas now, in Congress, the only way to prevent everybody from talking is to allow nobody to talk, then, in the interest of their own success, parties would be compelled to put forward their strongest speakers. The English Parliament is twice as numerous as our House of Representatives, yet there is no difficulty in conducting sustained debate, though they have had to resort to the "closure," or our "previous question," to get business done. As for conventions, their function could hardly fail to be considerably diminished. As it is now, the force of public opinion is so strong as to compel them, in a wonderful degree, to limit their nominations to men of at least respectable character, though, politically speaking, the entire absence of personality leaves the matter to be settled by chance or intrigue. If the people were sufficiently acquainted with their public men to have and to manifest decided preferences, the convention would have its work so far cut out as not to be in much danger of going astray. G. B.

BOSTON, March 31, 1888.

COLLEGE ADMISSION BY CERTIFICATES.

TO THE EDITOR OF THE NATION:

SIR: Two examples have recently come to my knowledge which seem to have a bearing on the subject of "Admission by Certificates," written upon in your last issue.

The first illustrates the difficulty of enforcing a uniform standard of excellence, even when all students have been tested by the same examination papers. An instructor in Harvard lately took a position in another institution of high rank. One of his first duties was to examine some written exercises. Only those students who obtained 50 per cent. passed. He marked these papers after the Harvard standard, and found, in round figures, that one-third had passed, and a second third, having obtained between 40 and 50 per cent., were conditioned. Distrustful of the result, he consulted a colleague, and learned that he had expected too great accuracy, and that, marked after the customary standard, two-thirds should have been wholly successful. How much more are the obstacles in the way of a uniform standard multiplied when the number of privileged schools is increased, and especially when each sets its own tests of the student's proficiency.

The second incident was as follows: A young lady wishing to study solid geometry in connection with the "Study at Home Society," wrote that she had passed the entrance examinations of one of the three colleges mentioned, and was consequently excused from the review of plane geometry, which, according to custom, would have been required of her. Her work proved below the usual standard. Inquiries were made, and it was learned that she had passed the college examinations of an "approved" private school, privileged to send its students "on certificates" to that college. Is it fair to infer that these colleges are becoming responsible for a false standard of scholarship in girls' preparatory schools?

An extension of the plan initiated by Harvard and adopted by Vassar, of holding local examinations, would have all the advantages of the certificate system and none of its faults. By this well-known method, the questions are prepared and the answers examined by the college officials. A beneficial relation is established with the preparatory schools, and the student is saved the expense of a long journey. The authority of the faculty is delegated to one of its members, or, perhaps, to a graduate, only so far as to insure the fairness of the examination. The entire responsibility for the admission or rejection of a candidate lies with that person who, presumably, has the highest interests of the college most at heart, its President.

"Long experience has already taught male colleges the necessity, if they would be true to

their ideal, of insisting upon thorough preparation for their work. We do not see how female colleges can be exempt from this necessity, if they are to give young women similar advantages. Women, they say, jump to conclusions, but can they jump over grammars, spelling-books, arithmetics, and geometries, and begin, on an equal footing with our less-gifted sex, the study of the higher branches of literature and science?" (L. Clarke Seelye, Inaugural Address, pp. 13-14.)

Very respectfully, H.

CAMBRIDGE, MASS., March 30, 1888.

A VINDICATION OF DR. VON HOLST.

TO THE EDITOR OF THE NATION:

SIR: The letters of "N. Z." in your issue of March 15 (p. 216), and of "G. B." in your last number (p. 258), have suggested the question whether those writers and some other writers have fairly criticised Prof. von Holst. The article to which "N. Z." refers lies before me in the earlier form of an address before the University of Freiburg. On page 16 is found the following passage: "Staat und Volk sind aber nicht von einander zu trennende Begriffe, und die Senatoren haben daher, obwohl sie nicht von dem Volke, sondern von den Legislaturen gewählt werden, in dem Empfinden der Gesammtbevölkerung weit mehr als die Gesammtheit der Repraesentanten den Charakter von Vertretern des Volkes." Will "N. Z." or any other thoughtful man deny that the people of a State as a whole recognize the Senators as their representatives rather than the Congressional delegation of the State, taken as a whole? If a great petition were forwarded from a State coming from every quarter of it, would it probably be presented by the delegation or by a Senator? Again, my own experience and belief is, that people who know who are the Mayor of their city and the Governor of their State can also mention both their Senators, and are quite unable to give the names of all their Congressmen. On the veto power and the initiative of legislation, Prof. von Holst may have laid himself open to attack; but foreign writers have no monopoly of heterodox opinions on those or any other points of constitutional law. It is one thing to disagree with a critic of our institutions, and another to say that his different opinion proves his want of acquaintance with his subject.

The charge made by "N. Z." is one of ignorance; "G. B." adds a charge of partisanship. "Dr. von Holst," says he, "is no friend of republican or parliamentary government, as shown not merely in his writings, but by the fact . . . that, after living some time in the country, he has preferred to . . . make his home in Germany." Several such criticisms have at various times come to my notice, and not one has ever been proved either from the writings or the life of the eminent German writer. A very intelligent young scholar remarked to me recently that the 'Constitutional History' seemed based on a comparison of twelve or fifteen of the best general works. I was able to assure him, from personal knowledge, that it was based on a study of many hundreds of volumes, including whole sets of *Congressional Globes*. On the other hand, I have more than once heard the criticism that he placed too much dependence on untrustworthy writers; the only specific instances furnished were John Quincy Adams's memoirs, which did not appear till the earlier part of the work was finished; and Giddings's works, against which Von Holst himself repeatedly warns his readers. If he understands our institutions imperfectly, it is because a long residence here and repeated visits, made for the purpose of investigation, are not sufficient; and any scholar who reads carefully his new 'Constitutional Law' must admit that it seems permeated with a critical and friendly understanding of the spirit of our institutions, and that the errors in it are extremely few.

The essential unfairness of assertions that Prof. von Holst is unfriendly to our institutions lies in the fact that in Germany he stands as their defender. The 'Constitutional History' began in a study of the workings of universal suffrage, upon which he entered at the instance of some Bremen gentlemen, who wished information when the German Confederation was founded. The first volume, and indeed the whole history, has been written for the enlightenment of the German public. With Friedrich Kapp, the lamented correspondent of the *Nation*, Von Holst has persistently called the attention of his countrymen to the greatness and the success of the American Union; he has constantly attempted to correct misapprehensions and misjudgments in regard to our Government.

One American writer has gone so far as to hint that a Prussian travelling stipend has bought his pen to use it in detraction of the United States—perhaps of free institutions; and "G. B." finds something portentous in his return to his native country. Germans themselves know that as a writer, a public speaker, and a legislator (he has been a member of the upper house of the Baden Legislature), he has set his face against the tendencies to absolutism in Germany. There is plenty of biting criticism of individual Americans in his works, and often specific national characteristics are excoriated; but I have found in them a thoughtful appreciation of American character and of republican government. The American university which twice called him to its chair of history, seems to have had no doubts on that score, and those persons who have worked in his library and talked with him about American history, will agree that they have found a very keen admiration for the American Republic. I commend to "N. Z." and to "G. B." these closing words of Von Holst's 'Constitutional Law': "No people of ancient or modern times has shown a greater capacity for founding a state." A. B. H.

CAMBRIDGE, MASS., March 31, 1888.

DARED AND *DURST*.

TO THE EDITOR OF THE NATION:

SIR: A reviewer, in your issue of the 16th ultimo, combines quotation and implied criticism, in the words "no colonial barrister *dared* (*sic*) defend the accused," etc. As he can hardly prefer, instead of *dared*, *durst*, a form rapidly going out of use, it must be supposed that, in his opinion, good English imperatively requires "*dared to* defend."* The following passages will serve at once to throw light on the approximate age of expressions like *dared defend*, and to suggest whether they are liable to censure. As regards the earliest of them, it is observable that we find "She *dar'd to* brook Neptunus' haughty pride," in the page next to that in which it occurs.

"Who *dar'd*, for Edward's sake, *cut* through the seas." Robert Greene (died 1592), *Dramatic Works* (ed. 1831), Vol. I., p. 159.

"They *dared* not *doe* as others did." Jeremiah Burroughs, *Sions Joy* (1641), p. 26.

"Yet *dar'd* she not *discover* to him the true cause of them." William Browne, Trans. of *Polexander* (1647), Vol. I., p. 229.

"No man *dared* afterwards, for the sake of a reward, *expose* himself to the fury of the people." Dr. Johnson (1743), *Debates in Parliament* (ed. 1787), Vol. II., p. 441.

"Libanius and the rest . . . *dared* not so much as *mutter* the least suspicion of this nature." Bp. Warburton, *Julian* (1750), in *Works* (ed. 1811), Vol. VIII., p. 228.

"Yet none *dared vent* their indignation." Goldsmith, *History of England* (1771), Vol. II., p. 337.

"My advice, however salutary and necessary, as it seemed to me, was such as I *dared* not *have given* [*correctly*, should not have dared give] to a poet of less diffidence than he." William Cowper, *Letter to Mrs. Bodham*, Nov. 21, 1790.

"Though I *dared warrant* for the pleasantness of the journey on the whole," etc. Coleridge (1809), *The Friend* (ed. 1818), Vol. I., p. 23.

"They *dared* not openly *inculcate* the old faith." Southey, *Life of Wesley* (1820), Vol. I., p. 316.

"Cowper said, forty or fifty years ago, that he *dared* not *name* John Bunyan in his verse, for fear of moving a sneer." Lord Macaulay, *Essay on Bunyan* (1831), concluding paragraph.

"I *dared* not *hazard* the opinion," etc. W. S. Landor, *Pericles and Aspasia* (1836), CXXXV.

"She *dared* not *commit*," etc.; "I *dared* not *tell* why." Cardinal Newman, *Apologia pro Vita Sua* (1864), pp. 196, 288.

From the pages of Coleridge, Southey, Cardinal Newman, and other authorities of the first rank, not to speak of writers of inferior note, I might, if it were necessary, add largely to these quotations.

According to Dr. Latham, as cited by Dr. Worcester: "We can [*sic*] perhaps say, 'I *dared venture* on the expedition.'"

Dr. Johnson, and also Archdeacon Todd and Dr. Latham, as editors of his Dictionary, do not recognize the preterit *dared*; nor does the lexicographer Dr. Richardson. Dr. Webster's editors insert it; but Dr. Webster himself knew nothing of it, and the Dictionary of Dr. Worcester, for all the improvements that it has undergone since his death, has still to record its existence.

As to Grammars, that of Dr. Richard Morris (ed. 1873), and that of Dr. William Smith and Mr. T. D. Hall, which enjoys great vogue in England, are, like a host of their predecessors, unacquainted with it. Mr. C. P. Mason, in the twenty-fifth edition of his very popular *English Grammar* (1881), imparts the information, respecting *dare*, that "The past tense now in use is 'I durst.'"

Can it be, then, that Shakespeare and Milton, with countless other writers of the last three centuries, have been deemed insufficient to sanction *dared* as the equivalent of the obsolescent preterit *durst*? Certainly not; the truth being simply, that, from want of critical familiarity with our literature, the above-named professed guides to our language, Dr. Webster's editors excepted, were unaware of its reputable employment.

Durst, as a past participle, escaped Dr. Webster; but his editors supplied it, and yet struck it out in their edition of 1880. One would like to know why. In my *Modern English* (1873), p. 229, I ask: "Among what barbarians is 'I have not *durst* do it' good English?" Though this question may still be put, I now know, though, fifteen years ago, I was ignorant, that *durst* was a participle in former times, and preceded *dared*. I find it used by Alexander Barclay (1508), Dr. Samuel Collins (1617), Henry Earl of Monmouth (1650), Sir Richard Baker (1654), and Samuel Pepys (1665). It is unrecognized by Dr. Richard Morris and the other grammarians that I have spoken of, and by dictionary-wrights generally.

Referring to Tarlton's *Newes out of Purgatorie* (about 1590), Mr. T. L. Kington Oliphant says, with his ordinary misplaced positiveness: "The verb *dare* now first forms a Past Partici-

* The *sic* was intended for the sentiment, not the syntax; the fact being that the author of the book under review had himself put "dared" in italics. But we are nothing loath to have elicited Dr. Hall's exposition of an interesting grammatical point.—ED. NATION.

ple; *having dared to look.*" *The New English* (1886), Vol. II., p. 13. Though he has reported at length on the language of Alexander Barclay, he has failed to observe, in his best-known work, the passage: "They sholde nat haue *durst* the peoples vyce to blame." *The Ship of Fools* (ed. 1874), Vol. I., p. 207.

At variance with recent usage, phrases like "I *durst to* do it" were long current. Citations in proof of this assertion must, however, be forborne. They have been taken from thirteen authors, beginning with Dr. Nicholas Harpsfield (about 1555), and ending with De Foe (1717).—Your obedient servant, F. H.

MARLESFORD, ENGLAND, March 11, 1888.

P. S.—"Chrysostomus *dared* say that our lady was now and then taken with a little vainglory." Tyndale, *Answer to Sir Thomas More's Dialogue* (ed. 1850), p. 207. The editor of this reprint, the Rev. Henry Walter, B.D., F.R.S., had access to a copy, preserved at Cambridge, of what he thinks is "not unlikely to have been [*sic*] the first edition" of the work: "the type is foreign, but is not Hans Luft's." But neither in that edition, nor in Day's somewhat modernized reproduction of it (1573), on a collation of which two the text of the *Answer*, where just quoted, is professedly based, is there Mr. Walter's "dared." Another old copy of the *Answer*, belonging to the British Museum, was, on the faith of the printed Catalogue, probably the production of a London press, and was issued in the year 1530. That copy, as my obliging friend Dr. Charles Gross informs me, has, instead of what is given above: "Chrisostimus *dare* saye, that our lady was now & then taken wyth a litle vayne glorie." This, in every the minutest particular, is the reading in the Cambridge copy, as the Rev. Professor Skeat, who kindly consulted it at my request, enables me to state. And not only in his *Answer*, but in his translation of I. *Cor.*, VI., 1, Tyndale has *dare* as the third person singular. That Mr. Oliphant, accepting as trustworthy the aforesaid sophisticated sentence, credits him with the use of *dared*, is a serious error. See his *New English*, Vol. I., p. 430.

AN AMERICAN SCHOLAR.

TO THE EDITOR OF THE NATION:

SIR: Is not the wording of your note in the *Nation* on March 15 on Dr. Seligman's 'Two Chapters on the Mediæval Guilds of England' unfortunate in giving the impression that Dr. Gross, upon whose thesis Seligman's work is so largely based, is a German? Of course the initiated know that he is a good American. But are we already so rich in rising scholars that we ought to neglect to claim one whose work does such honor to our young scholarship?

Yours respectfully,

ARTHUR G. CANFIELD.

UNIVERSITY OF KANSAS, LAWRENCE, March 28.

Notes.

TWO of the ten volumes of the 'Library of American Literature, from the Earliest Settlement to the Present Time,' compiled and edited by Edmund Clarence Stedman and Ellen Mackay Hutchinson, and published by subscription by Charles L. Webster & Co., are now ready, and the rest are expected to follow monthly. The work is illustrated with steel engravings and woodcuts.

The third and last volume of Mr. Henry C. Lea's 'History of the Inquisition' will be published directly by Harper & Bros., along with 'France and the Navy of the Confederate States: an International Episode,' by Mr. John Bigelow; and 'A Brother to Dragons, and Other Old-Time Tales,' by Amélie Rives.

A welcome announcement is the first volume (of two) of the 'Life and Letters of George P. Marsh,' by Mrs. Caroline C. Marsh, to be published by the Scribners. They have also nearly ready the second and final volume of Thomas Stevens's 'Around the World on a Bicycle'; 'Befo' de War,' poems by A. C. Gordon and Thomas Nelson Page; 'The Spell of Ashtaroth,' by Osborne Duffield; and a volume of sermons, 'Eternal Atonement,' by the late Dr. Roswell Hitchcock.

Those who possess Prof. Geo. P. Fisher's 'History of the Christian Church' will desire to procure for insertion in the appendix to that work a thin pamphlet (paged 670*a*–670*aa*) of 'Notes on the Literature of Church History' (Scribners).

Henry Holt & Co. issue shortly 'A Castle in the Air,' by Gen. Hugh Ewing.

'Woffington: A Tribute to the Actress and the Woman,' by Augustin Daly, will be a sumptuous volume in two styles, with sixteen full-page illustrations, sold in a limited edition by J. W. Bouton, 1152 Broadway.

Worthington Co. announce 'Yankee Girls in Zululand,' by Louise V. Sheldon, with numerous illustrations.

Thomas Whittaker has in press 'The Mental Characteristics of the Lord Jesus Christ,' by the Rev. H. N. Bernard; and 'The Gospels of Yesterday,' by Robert A. Watson.

The tracts known in Boston as 'The Old South Leaflets,' accompaniments of the annual historical lectures given at the Old South Meeting-house, have been found to meet a need, and are to be succeeded by a general series for the use of schools, colleges, clubs, and classes. These "will be largely reproductions of important original political and historical papers," with helpful notes. D. C. Heath & Co. will be the publishers.

The house of Hoepli, in Milan, has in hand for the present year not only the royal edition of the 'Divine Comedy,' with the inedited commentary of Stefano Talice, as we have already mentioned, but also the continuation of the 'Corpus Scriptorum Ecclesiasticorum Latinorum' at the minimum rate of three volumes annually; the 'Annali d'Italia dal 1861 ai nostri giorni,' edited by the director of the Royal Library at Brera in continuation of the 'Annali' of Muratori and Coppi; the second volume of 'La Storia degli Israeliti,' from the election of Saul to the fall of Jerusalem, by David Castelli; the second and third volumes of Cesare Luigi Gasca's 'Del Codice Ferroviario'; and 'L'Arte Italiana,' a collection of 150 plates, after mostly inedited works by classical Italian artists, edited by Prof. A. Melani.

Roberts Bros., Boston, send us, in a very handsome edition, a translation of Renan's 'History of the People of Israel till the Time of King David.' The type is large and clear, and the University Press may be trusted for the accuracy of the proof-reading.

We receive from Scribner & Welford the seventh edition of Dean Alford's 'The Queen's English,' in the neat form of "Bohn's Select Library." To be mentioned with it is the "Boudoir Edition" of 'Don't' (Appletons), so far as the chapter on speech is concerned; as well as the second edition of Robert Luce's 'Writing for the Press' (Boston: *Writer* Publishing Co.), and 'Slips of Tongue and Pen,' by J. H. Long (Appletons). All these authors attempt more or less to make the English language what they think it ought to be, logically, analogically, and to suit their personal preferences. Mr. Long thus deals with settled usage (p. 33): 'Nobody's else book' is said to be [by whom?] preferable to 'Nobody else's book.' Custom has, however, firmly established the latter form. But it is better [why?] to employ some other expression, *e. g.*, 'The book of no one else,' 'No other person's book.'"

Sir Joshua Reynolds's 'Seven Discourses on Art,' Fox's 'History of the Early Part of the Reign of James II.,' another instalment of Pepys's 'Diary' (1667-68), and 'London in 1731,' by Don Manoel Gonzales, are the newest issues in "Cassell's National Library."

Belford, Clarke & Co. have put together in a convenient volume, with an index, the United States tariff and free list of the Act of March 3, 1883; the Hawaiian Reciprocity Treaty; and parts of the Navigation and Oleomargarine Acts.

The disease consumption, however viewed, is always of public interest. As Dr. Bowditch determined for Massachusetts, and Dr. Buchanan for parts of England, the comparative degree of wetness in the soil was a fair measure of the proportion of consumption among the residents thereon. Dr. Pepper of Philadelphia attempted an investigation of the distribution of the same disease for the State of Pennsylvania, and presented his data and certain conclusions to the Climatological Association as a contribution to the climatological study of the disease. His inquiries were sent to 650 of the 5,000 physicians distributed through sixty-seven counties, and replies were received from 120 correspondents in forty-seven counties. The general deductions from the answers are that the localities having high mortality from consumption are those of little elevation and large annual rainfall, and that the hemlock regions, which correspond quite closely with the favorable climatic regions, have the greatest immunity. A very small proportion of the respondents recognize the influence of special local causes for this disease, such as the greater dampness of one house than another. The hereditary nature of the disease is almost unanimously admitted, while its infectious quality is receiving more general recognition. In race the negroes seem the most liable, and Jews the most exempt, but there are many other factors than those of nationality to be taken into account. Dr. Pepper regards his paper "as the first crude and imperfect result of an investigation which he hopes to be able to continue to a much greater degree of completeness." The address is accompanied with elaborate maps, charts, and tables, and is published very satisfactorily by the Appletons.

The editor of the Tauchnitz collection, in his choice of American books, has always followed the English taste, and he rarely reprints an American book until after it has approved itself in London. Hence he has only now decided to include in the series Gen. Wallace's 'Ben Hur.' But Mr. Marion Crawford's books appear in Leipzig almost as soon as they are issued in New York and London; the latest to figure on Baron Tauchnitz's catalogue being 'Paul Patoff' and 'Marzio's Crucifix.' We may note, also, that French translations of 'Marzio's Crucifix' and (oddly enough) of 'An American Politician' have been published in Paris.

Of the making of books about the stage there is no end in Paris; and not a few of these are annuals. The latest of these series is one of the prettiest, 'Paris sur Scène,' by M. Guy de Saint-Môr (Paris: Piaget; New York: F. W. Christern). It contains a gossiping account of the chief plays acted in Paris in the season 1886-7, adorned with abundant illustra-

tions—ingenious and amusing little process cuts not unlike those in M. Daudet's 'Tartarin.' Some of the thumb-nail sketches of actors are singularly successful in attaining a likeness—for example, that of M. Coquelin *cadet*. The chief comment made by a New York playgoer who may turn these pleasant pages, will be to the effect that very few of the plays which are produced in Paris are ever reproduced in New York.

The 'Soixante Ans de Souvenirs' of M. Ernest Legouvé has been republished in four 18mo volumes (Paris: Hetzel; Boston: Schoenhof), each of the large octavos of the original edition making two volumes of that now issued. These literary and theatrical recollections of the veteran author, who came in contact, in one way or another, with so many of the most interesting personages of the present century, are brought down only to 1876. The years after that date, and even, as the author tells us, those preceding it, which contain more personal and intimate details, form the framework for other recollections already begun, but not with any intention of present publication. As this clever and charming writer is never indiscreet, and especially never ill-natured in his revelations, those who care to penetrate into the literary life of France will regret that he should have thought it necessary to delay giving anything to the world upon a subject that has already done so much honor to his literary generosity.

Alphonse Lemerre, the publisher of poets, has been for some time issuing in weekly numbers an 'Anthologie des poètes français du XIXe. siècle,' of which the second volume (1818-1841) is just completed. If those who share the very general belief outside of France that there is no contemporary French poetry, should turn over the leaves of these two substantial volumes, they would be surprised at the number of poets represented there, and at the poetic and artistic value of their work; and perhaps they might also be convinced that much real and very charming poetry has been written in France by poets still almost young, as well as by those belonging to the great poetic generation now passing away.

The collection of documents concerning Jacques Cartier gathered by F. Joüon des Longrais, and lately published at Paris under the title 'Jacques Cartier: Documents nouveaux,' affords material for more definite information relative to the career of the explorer than has hitherto been current. The date of his birth is shown to be 1491 instead of 1494, and his death, about which there was no information, is found to have occurred September 1, 1557. Two letters by Jacques Nouel de Saint-Malo concerning the Canadian discoveries are reproduced, and confirm the generally accepted idea, that the Bretons, particularly the "Malouins," were fishing for cod off the coast of Newfoundland in the early part of the sixteenth century.

L. Kreichauf, Elmira, N. Y., will issue in the latter part of this month the first number of his *Quarterly Bibliography of American and English Literature*, covering the first three months of 1888.

The *Publishers' Weekly* for January 21 is a "Copyright Number," containing documents of much historic importance relating to the present movement for international copyright in this country, including authors and publishers. These are followed by publishers' lists of American copyright books, with an authors' index; but here only approximate completeness is arrived at.

An interesting *aperçu* of a MS. orderly book of Sullivan's campaign against the Six Nations in 1779 is given in the Cornell University *Library Bulletin* for January. At the end of the *Bulletin*, Mr. F. H. Hodder furnishes useful references on municipal government in the United States.

In the *Pennsylvania Magazine of History and Biography* for January, Dr. C. J. Stillé develops at some length, but without adding much to it, Bancroft's summary mention of the Comte de Broglie's ambition and proposal to be made stadtholder of the American colonies during their struggle for independence. He supplements Kapp's revelations in his 'Life of Kalb' with documents drawn from a recent publication to the French Government, 'Participation de la France à l'établissement des États-Unis d'Amérique.' An etched portrait of Michael Hillegas, the first Treasurer of the United States, is prefixed to this number of the *Magazine*. His name is even less known to the present generation than is the Comte de Broglie's mad scheme.

The *Botanical Gazette*, published at Crawfordsville, Ind., has its tribute to pay to the late Asa Gray in its March issue.

Prof. George H. Cook's annual report for the Geological Survey of New Jersey tells of the virtual completion of the great Atlas of that State, the pioneer of its kind. The forestry of the northern sheets is still to be indicated. A cadastral and economic survey is the next desideratum. The mapping of the State has cost about one and one-twelfth cents per acre. A relief map of New Jersey on a scale of five miles to an inch has been made by the Survey, to exhibit drainage and sources of water supply. A general map of the entire State on the same scale accompanies this report.

The calendar of the University of Michigan for 1887–'88, just issued, brings gratifying evidence of the steady growth of that institution. With the exception of that of medicine and surgery, every department shows an increase of attendance compared with last year, and the total number of students, 1,667, is larger by nearly one hundred than ever before in the history of the University. As has been usual in recent years, about one-half of the students are residents of Michigan. Seventy-two names are credited to Canada and other countries outside of the United States. There are 62,398 volumes in the libraries, besides pamphlets and maps. The list of members of faculties and other officers contains ninety-nine names, but since the opening of the year two professors have been taken away by death—Dr. A. B. Palmer, who for more than thirty years was prominent in the medical faculty, and Dr. B. W. Cheever, professor of metallurgy. The chair of pedagogy, made vacant in February by the resignation of Professor W. H. Payne, has been filled by the appointment of ex-President B. A. Hinsdale of Hiram College.

There is a noticeable development of summer schools at Harvard, those advertised for the coming season covering Botany, Chemistry, French, German, Geology, History, Physics, Physical Training, and Topography. Notice of intention to join must be given by June 15. The Secretary of the University will furnish particulars.

—There are passages in Shakspere where commentators find either no sense, or a sense at war with the context. Yet in some of these passages, by changing a single word, we secure significance, and one in keeping with the surroundings. But judicious critics less and less venture on conjectural emendations, however plausible. If, however, the sense-making word an emendator would like to introduce is discovered to have been actually employed, in some work near Shakspere's era, as a typographical correction of a word which had been misprinted identically with the non-significant word in Shakspere, the critic who should correct the great dramatist as one of his contemporaries was in fact corrected, would not fear the charge of tampering with the text. Speculators on Shaksperian corruptions are thankful for every new hope, even the faintest, of textual correction. Resolved to do his utmost for them, Mr. Halliwell-Phillipps has just printed in their behalf a 'Dictionary of Misprints.' This work, which is a list of more than two thousand words that he finds misprinted in books issued in the sixteenth and seventeenth centuries, is a mere instalment of what he hopes to expand into something more voluminous. Each wrong word in the alphabetical array is followed in the same line by the right word as Mr. Phillipps has extracted it from tables of errata. The comments of the compiler suggest to verbal critics the application of his vocabulary of errors to the elucidation of truth. In the passage, "O, then we bring forth weeds, when our quick minds lie still," the word "minds" is a conjectural emendation of Warburton's which Grant White says that "he adopts with hesitation." The word "winds" stood instead of it in all early editions. Other emendators have proposed "wints," meaning "two furrows ploughed by the horses going to and fro to the end of a field and back again." Were White alive, he would adduce the Dictionary of Phillipps as thickening other proofs that do demonstrate thinly, for in that work we find "wind" as an actual misprint for mind in an ancient author. Thus Warburton's conjecture has authority. Seldom has refuse been turned to so good use as by this Dictionary. We are reminded of the French company who bought for a song the exhausted silver mines at Laurion, and, thanks to modern processes of smelting and reducing, turned out from the refuse slag more precious metal than the old Athenian miners had been able to extract from virgin ores. Well said *Autolycus:* "Every lane's end, every shop, church, session, hanging, yields a careful man work."

—The Cambridge University Press has just issued Mr. Charles M. Doughty's 'Travels in Arabia Deserta,' from 1876 to 1878, a book which has been ten years in preparation, and in which the author has had the assistance of such scholars as Renan, Sachau, Wright, and others. Mr. Doughty had prepared himself for his journey by a long residence at Damascus, and a wandering in Petræa in 1875. He never for a moment concealed his English nationality or his Christian faith, preferring, with a curious stubbornness, to die rather than allow it to be supposed for a moment that he belonged to the Mohammedan religion. Perhaps, after all, his concealing nothing and his always speaking the truth were his greatest safeguards. He started from Damascus with the pilgrims to Mecca, then lived entirely among the Bedouins, passed a long time in captivity near Medina, and several times narrowly escaped death. He discovered and copied many interesting inscriptions, compiled a vocabulary of the Nejd dialect, made many additions to our knowledge of the geography and geology of Arabia, and has rendered far more precise our notions of the Arabs in pre-Islamic times. His book, which is in two thick octavo volumes, with maps and illustrations, is written in a style which at first seems barbarous and affected, but which is soon seen to be a personal peculiarity of the traveller, coming partly from his hermit life in the East. His studies of English apparently stopped with the Elizabethan period and the

authorized version of the Bible, but they have given him a style eminently suited to his subject-matter. The book can be opened anywhere and read without weariness—a worthy companion to the 'Arabian Nights.'

—Concerning the merits of Cook's translation of Sievers's 'Anglo-Saxon Grammar,' *first* edition, we have already spoken. Prof. Cook, an indefatigable laborer in this domain, follows closely in the footsteps of his master. He has just favored us with a translation of the *second* edition of Sievers (Boston: Ginn & Co.). The initiated know that the translation is emphatically a labor of love, of devotion to sound scholarship, costing the translator no small sacrifice. The least that we can do in turn is to hasten to say that the work is well done and well worth the doing. By its aid our teachers and students of Anglo-Saxon will be fully abreast of the times, so far as that may be said of any progressive branch of science. We believe that Sievers's Grammar in its present shape (German and English) will remain now the universal handbook for many years to come. Increasing knowledge may add a point here, modify a statement there; but the general principles and rules will remain intact. At only one point do we detect the possibility of a general change—namely, Bugge's recent attempt (*Beiträge* xii, 399–430; xiii, 167–187, 311–339) to apply Verner's rule to initial consonants. Yet Bugge's views, even if accepted, would only modify our conceptions of certain stems and etymologies; they would scarcely enter, as *eclipsis* does in Keltic philology, into the domain of formal grammar. Moreover, Bugge's investigation has not yet got out of the region of grammatical speculation. Usually a translator contents himself with reproducing his original; but Prof. Cook is one who leaves his original better than he finds it. His indexes are much superior to those of the German text. We regret that his paragraphing could not be made to correspond in every case to the German, and that he has felt obliged to condense certain minor details. We should have preferred Sievers pure and simple. But doubtless these departures from the original were occasioned by practical and personal considerations which we are bound to respect. It must have been the early printing of the title-page which has left Sievers still Professor in Tübingen, instead of installing him in Zacher's chair at Halle. We congratulate the translator upon accomplishing a most useful but toilsome task; we hope that his public will not prove ungrateful. Now that his hands are free, we look with eagerness for his more original work upon the Northumbrian gospels.

—In a recent number of the *Revue Bleue* the critic, M. Jules Lemaitre, gives a very entertaining account of the new school of French poets, the symbolists, decadents, and impressionists. These gentlemen, discontented with the monotony and conventionalism of French verse, attempt to put into their rhymes a little more color and music, and aim only at producing in the mind of the reader a vague impression. They seek for the musical value of the words, taking their sense into account only to a certain extent. In order to make this easier, M. René Ghil has published a pamphlet, entitled 'Traité du Verbe.' In a style that it is difficult to understand, no matter which way you turn it, he explains what is meant by symbolism. We find from this that of the vowels, taking them, of course, in their French pronunciation, A is black, E white, I blue, O red, U yellow. Black is the organ, and expresses doubt, monotony, and foolishness; white is the harp or serenity; blue, the violin, passion and prayer; red, the trumpet (this is a very old symbol, as is seen in the well-known story of the blind man), glory and triumph; yellow, the flute, simplicity and smiles. One can readily understand the desire for greater variety in French verse, which Lemaitre himself says has always too much resembled fine prose, and in which to seize the rhythm it is necessary to pronounce vowels and syllables which in prose are silent. These young men, too, have perhaps noticed that indifferent verse seems much finer in a language which one only half knows; or at least where one does not perceive the exact shade of meaning of all the words, from which only a vague impression is received. We used to wonder, by the way, whether this were not one reason for the greater enthusiasm displayed by young persons in learning German, where they soon are taught by ballads and short poems, than in studying French, which is chiefly pursued in prose. The trouble about the impressionists is that they give so little heed to the sense of the words they use, or employ them in meanings so out of the common, that where these verses are not obscure they cannot be understood at all. Here is a specimen from M. Paul Verlaine:

"En ta dentelle où n'est notoire
Mon doux évanouissement,
Taisons pour l'âtre sans histoire
Tel vœu de lèvres résumant.

"Toute ombre hors d'un territoire
Se teinte itérativement
À la lueur exhalatoire
Des pétales de remuement."

—Voltaire gave us a receipt for finding whether French verses were good or bad—"put them in prose." Here are some more of M. Verlaine's verses in prose:

"The moon was spatting its tints of zinc in obtuse angles; whiffs of smoke shaped like fives were coming out thick and black from the high pointed roofs.

"The sky was gray. The north wind was weeping like a bassoon. Far away a tomcat, shivering and discreet, was miauling in a manner strange and shrill.

"I was walking along, dreaming of the divine Plato and of Phidias, of Salamis and Marathon, beneath the winking eye of the blue gas-jets."

That is all of it. But we agree with M. Lemaitre in not knowing what it means, and cannot see the symbolism even of the vowels and consonants. Here, however, is another which sounds as well as most modern poetry, and, when properly read and reread, does somehow leave a vague impression, but too vague to state:

"Le souvenir avec le crépuscule
Rougeoie et tremble à l'ardent horizon
De l'espérance en flamme qui recule
Et s'agrandit ainsi qu'une cloison
Mystérieuse, où mainte floraison—
Dahlia, lis, tulipe et renoncule—
S'élance autour d'un treillis et circule
Parmi la maladive exhalaison
De parfums lourds et chauds, dont le poison—
Dahlia, lis, tulipe et renoncule—
Noyant mes sens, mon âme et ma raison,
Mêle dans une immense pâmoison
Le souvenir avec le crépuscule."

Such is the art of the poet that the lines produce the same impression, when read from bottom to top as from top to bottom.

—A careful and interesting biographical record is Antonio Zardo's recent work, 'Il Petrarca e i Carraresi' (Milan: Hoepli), treating of the intimate relations existing between the poet and the Paduan princes, Jacopo (the second) and Francesco (styled the Old) di Carrara. The book is, on the whole, the fullest narrative of Petrarch's closing years, which were spent in the dominions of these princes at Padua and Arquà, and were years of peace and honor. The various contemporary accounts of his death are printed *in extenso* and closely criticised, and the volume closes with an appendix of documents, some of them new. Professor Arturo Graf, of the University of Turin, has occupied himself, on the other hand, with a period subsequent to Petrarch's death, of which he has produced a vivid picture in his 'Petrarchismo ed Antipetrarchismo nel Cinquecento,' reprinted from the pages of the *Nuova Antologia*. He does full justice to the myriad of rhymesters whose dull and heavy productions bade fair, at one time, to drag the unexcelled lyrics of their master and model with them into oblivion. One of the men who did something to prevent such a catastrophe was the famous author of the 'Secchia rapita,' to whom a young writer, Orazio Bacci, has devoted his essay on 'Le *Considerazioni sopra le Rime del Petrarca* di Alessandro Tassoni,' in which is told, with much painstaking research, the story of a singular literary quarrel of the early years of the seventeenth century. This combat, carried on with the usual verbose acrimony of those days, grew out of Tassoni's commentary on Petrarch, the two principal belligerents being Tassoni himself and a somewhat pedantic Paduan student, Giosefo degli Aromatari. The work has, as an appendix, a good bibliography of the letters of Tassoni, edited and inedited. Its author is at present preparing an edition of the 'Epistolæ sine Titulo' of Petrarch, which, by reason of the author's violent invective against the Papal curia, were not included in Fracassetti's great collection of Petrarch's letters. A still later Petrarch publication is a pretty brochure by Giuseppe Agnelli, 'De le tre Canzoni sorelle di Francesco Petrarca' (Bologna, 1887); it contains the Marsand text of the three famous odes, with a comment chiefly remarkable because it cites the opinions of noted critics from Varchi to De Sanctis. It is perhaps not improper to end this hasty résumé of recent additions to Petrarch literature with a reference to Mr. J. A. Symonds's sketch of the poet in the 'Encyclopædia Britannica,' though it be now more than two years old. It was written before the astonishing "finds" of the past year, and even before Professor Bartoli's happy discovery of the real "dedicatee" of the magnificent canzone, *Spirto gentil*, but it is, nevertheless, the only readable or accurate biography of Petrarch published in the English language. Its brevity is its only fault.

—'L'Ornement Slave et Oriental, d'après les Manuscrits,' is the title of one of the most superb volumes of the past year, having more than 120 plates, and letterpress in Russian and French. The author of this artistic collection, Vladimir Vasilievitch Stasoff, at first held the common view, that Russian ornament had been borrowed in early times from MSS. of Byzantine, Bulgarian, and Servian origin. A more profound study of MSS. in the last category existing in the Imperial Public Library at St. Petersburg and elsewhere showed that direct borrowing was not sufficient to account for all the ornamental forms present in Russian MSS. He found it necessary to enlarge his scope of investigation and to admit many other nations hitherto neglected. This volume is the result of the author's studies for the last twenty-five years, and the specimens of ornament have been taken from MSS. in all the great European libraries, as well as from those preserved in Russia and in the countries cited. Rare MSS. were sent for study from Kieff, Bucharest, the Ecclesiastical Academy of Kazan, etc.; and a Galician MS. from Poltava. Among the illustrations are some taken from the magnificent copy of the Koran purchased by General Kaufmann from the mollahs of a Mosque in Samarcand, and which is now in the Imperial Public Library. In Mr. Stasoff's collection great care has been taken to reproduce

color and outline with absolute accuracy, and every design is accompanied by a reference. The Public Library in Boston has been marked for a copy of this splendid work (which was published by permission of the late Emperor, Alexander II., chiefly from the imperial exchequer) as a present from the author.

IN GOOD OLD COLONY TIMES.

The Colonial Laws of Massachusetts. Reprinted from the edition of 1672, with the supplements through 1686. Published by order of the City Council of Boston, under the supervision of William H. Whitmore, Record Commissioner. Boston. 1887. Pp. 395.

THE publication in 1672 was the third published revision of the colony laws, and was entitled 'The General Laws and Liberties of the Massachusetts Colony.' The next previous Revision was published in 1660, and the earliest of all in 1648; but of this last it is not known that any copies are extant. The production of the volume before us is most creditable to Mr. Whitmore, as well as to the city of Boston, by whose judicious and liberal appropriation the expense has been defrayed. The method employed was a photographic facsimile, corrected (as is necessary in such cases) by the most scrupulous and literal proof-reading.

This Revision is divided into subjects, or heads of laws, arranged alphabetically, so that it is easy to ascertain the statute law of the time on any subject considered in the Revision. Moreover, an abundant index (not only the original of 1672, but one for the present compilation) enables us to ascertain and refer readily to all that is in the book. As the legislation of the different years is generally in distinct paragraphs, with the date of enactment affixed, we can trace much of the earliest Revision, and some legislation prior to 1641. Under the title "College," for example, we have in the first paragraph the provisions made in the years 1636, 1640, and 1642 concerning Harvard College, and in the remaining paragraphs the contribution to that institution in 1659.

It has been suggested that the legislation of the colony was based upon the laws of Moses, and that its laws were merely transcripts of those laws. While this is measurably true of the very small portion embraced under the title "Capital Laws," it is altogether incorrect as to the rest of the Revision of 1672. In the title in question sixteen crimes punishable with death are enumerated in separate paragraphs, with a reference in the case of fourteen to certain books of the Old Testament, and generally to the chapter and verse, indicating that the respective crimes were punished with death by the Jews. Again, under the title "Indians," the first paragraph is as follows: "For settling the Indians' title to lands in this Jurisdiction, it is declared and ordered by this Court and authority thereof, that what lands any of the Indians in this Jurisdiction have possessed and improved, by subduing the same, they have just right unto, according to that in Gen. 1, 28, and chap. 9, 1, and Psal. 115, 16." With the exception of these two titles, a careful examination has not discovered in the whole of the Revision of 1672 any reference to any book of the Old Testament.

Nor in the other laws is there reference in terms to the laws of any other country. Though they are full of the principles and provisions of the English common law, there is but a single reference to any English authority. We find this under the title "Ships, Ship-Carpenters," the first paragraph of which (probably a law of 1641) authorizes the appointment of "some able man to survey the work [of shipbuilding] and workmen from time to time, *as is usual in England*," etc. On the other hand, for intrinsic evidence that the colony laws were prepared by those who were acquainted with the laws of England, take the title "Lands, Free Lands":

> "It is also ordered, and by this Court declared, [viz., in 1641], that all our lands and heritages shall be free from all fines and licenses, upon alienations, and from all heriots, wardships, liveries, primer-seisins, year, day and waste, escheats and forfeitures upon the death of parents, or ancestors, natural, unnatural, casual, or judicial, and that for ever."

This shows most clearly how heavily to their knowledge the burden of feudal exactions in the mother country had oppressed the owners of lands, and the determination of the colonists to have none of them here; and the specific enumeration of the matters prohibited indicates an acquaintance with the laws relating to the conveyance and descent of lands, and the oppressive appendages of the feudal tenure. So the punishment provided for scolds—that they be "gagged, or set in a ducking-stool, and dipt over head and ears three times in some convenient place of fresh or salt water, as the court or magistrate may judge meet"—is substantially of the same nature as was imposed by the common law of England in like cases. Other instances might be adduced.

In 1647, in order clearly to determine the meaning of a clause in the "Common Liberties" of 1641—to wit: "Every inhabitant who is an householder, shall have free fishing and fowling in any great ponds, bays, coves, and rivers, so far as the sea ebbs and flows within the precincts of the town where they dwell," etc.—it was enacted that the proprietor of the land adjoining such waters shall have propriety to low-water mark, where the sea does not ebb more than a hundred rods. This Colony ordinance is the foundation of the rule of law now established by usage in New England, contrary to the rule of the English common law which limits the ownership to the line of high-water mark; the King owning the land over which the sea ebbs and flows.

The infliction of bodily punishments for offences appears to have been left, within certain limits, largely to the discretion of the magistrates. Under the title, "Punishment, Torture," it is declared that none are allowed that are inhuman, barbarous, or cruel. Yet the language of the law would seem to leave the way open for the infliction of such punishments. The provisions are, that

> "no man shall be beaten with above forty stripes for one fact at one time, nor shall any man be punished with whipping except he have not otherwise to answer the law, unless his crime be very shameful, and his course of life, vicious and profligate; and no man shall be forced by torture to confess any crime against himself or any other, unless it be in some capital case where he is first fully convicted by clear and sufficient evidence to be guilty, after which, if the case be of that nature, that it is very apparent there be other conspirators or confederates with him, then he may be tortured, yet not with such tortures as are barbarous and inhuman."

We can gather from these statutes striking illustrations of the great difficulty, if not impossibility, of extinguishing, or entirely suppressing, the instincts, impulses, affections, and passions of a neighborhood or people by legislation. Take, for example, the laws and regulations for the observance of the Lord's day. One would suppose that if, in any community, such regulations would be scrupulously and willingly obeyed, it would be in this colony, where at first only church members could be freemen, and only freemen could vote. Yet, in 1653, a law was passed (which appears in the Revision of 1672, title "Sabbath") punishing the violations of such regulations first with admonition and then with fine, and persistent violations with fine or stripes, in the preamble to which law were set forth the objectionable practices it was desired to prevent. Five years later, in 1658, the practices evidently continuing and perhaps increasing, an additional statute was passed, contemplating fine or corporal punishment, with the following preamble:

> "Whereas, by too sad experience, it is observed, the sun being set, both every Saturday and on the Lord's day, young people and others take liberty to walk and sport themselves in the streets or fields, in the several towns of this Jurisdiction, to the dishonor of God and the disturbance of others in their religious exercises, and too frequently repair to public houses of entertainment, and there sit drinking, all which tends not only to the hindering of due preparation for the Sabbath, but as much as in them lyeth renders the Ordinances of God unprofitable, and threatens the rooting out of the power of Godliness and procuring the wrath and judgment of God upon us and our posterity; For prevention whereof it is ordered," etc.

In the autumn of 1675 a remarkable statute was passed—in some respects the most remarkable in the volume—entitled "Provoking Evils." It is an act of profound humiliation and confession of the sins of the people, a sincere repentance therefor, and a declaration of the evils which have justly provoked the anger of the Almighty. It shows the terror of the colonists, and illustrates, in a somewhat exaggerated way, their methods in like cases. The preamble, too long to quote here, is followed by twelve sections setting forth and punishing the "provoking evils" which are to be avoided in future: (1) a neglect of discipline in the churches, especially respecting children; (2) the wearing of long hair or of periwigs by some men, and immodest hairdressing by women; (3) pride in apparel; (4) the open meeting of Quakers, with their damnable heresies and abominable idolatries; (5) a profane turning of the back on the pulpit before the close of service; (6) boyish disorderliness in church; (7) "common swearing and cursing"; (8) excessive drinking; (9) a woful breach of the Fifth Commandment; (10) idleness "(which is a sin of Sodom)"; (11) "oppression in the midst of us, not only by such shopkeepers and merchants who set excessive prices on their goods, but also by mechanics and day laborers who are daily guilty of that evil"; (12) a loose and sinful custom of riding from town to town, with tavern frequenting by both sexes under pretence of attending lectures. The judgment that people of sound orthodoxy to-day would pass upon the foregoing, illustrates one of the differences between public opinion in 1675 and in 1888.

We close with the remark that the whole volume contains matters of great interest to those who take pleasure in studying the building up of the colonies in New England, and especially the Massachusetts Colony. It is hardly a stretch of the imagination to think that by means of this facsimile—resembling even in the appearance of the paper the edition read by the men of 1672—we catch more readily their spirit and that of the Colony, and understand more intelligibly their laws. For this we renew our thanks to the city of Boston, and to the Senior Record Commissioner, whose services on behalf of local history and antiquities are ever gratuitously at the disposal of his townsmen.

THE ACROPOLIS OF ATHENS.

Die Akropolis von Athen, nach den Berichten der Alten und den neuesten Erforschungen. Von Adolf Boetticher. Mit 132 Textfiguren und 36 Tafeln. 8vo, pp. 295. Berlin: J. Springer; New York: Westermann. 1888.

If we make use of a trite publisher's phrase in saying that "this book supplies a long-felt want," it is because in the present case the words are literally true. It is thirty-four years since the first and best edition of Beulé's 'L'Acropole d'Athènes' was published, and although successive excavations have put that further and further behind the times, it has still remained the best handbook of the Acropolis ever written. The second edition, which appeared eight years later, contained merely the substance of the first in more condensed and popular form, and was therefore of less value to scholars. Indeed, incredible as it seems, in view of the attractiveness of the subject, Beulé is the only modern writer who has devoted an entire book exclusively to the Acropolis; and of those who since his time have written upon Athens, none have superseded him on his own ground. Breton's 'Athènes' (1861) is so largely inspired by Beulé's book as to be little more than a weak reflection of it; of Dyer's 'Ancient Athens' (1873) the Acropolis occupies but a small portion, and that based mainly upon Beulé, with the addition of an excellent description of the Dionysiac Theatre; Wachsmuth's 'Stadt Athen,' the first volume of which appeared in 1874, has as yet treated the Acropolis only topographically; and Burnouf's 'La Ville et l'Acropole d'Athènes' (1877) was so evidently written in a spirit of hostility towards Beulé, and with a view to opposing him at every point, that the author allowed his prejudices to run loose, and thus spoiled what otherwise might have been a valuable book.

Yet the need of a new work on the subject which should summarize the results of the later excavations, and give to general readers, in accessible form, the changes in facts and theories brought about by these excavations, has been growing greater with every year. When Beulé wrote, the Dionysiac Theatre had not been discovered; the terrace on the south side of the Acropolis, on which we now see the remains of the sanctuary of Asklepios, was still covered with a heap of refuse soil thrown over from the excavations above; the Temple of Niké Apteros had been reconstructed, but its connection with the Propylaia had not been made clear; the floor of the Parthenon was still encumbered with remains; several of the old Turkish houses were still standing on various parts of the citadel; the excavations for the museum east of the Parthenon, which brought to light many fragments of early Greek art, were not begun; Michaelis had not published his exhaustive work on the Parthenon. The accomplishment of all these undertakings would have warranted the publication of a new book some years ago, but the investigations conducted by Dr. Dörpfeld and the Greek Archæological Society during the last five years have been in many respects more important, as regards results, than those of the thirty years preceding. The discovery of a temple of Athena, hitherto entirely unsuspected, in the very middle of the Acropolis, has upset many pet theories regarding the early history of the place, and he who seeks his knowledge of it from Beulé to-day gets what is indeed antiquated. Naturally it is impossible that everybody who is interested in the subject should be able to follow all these excavations, and only special students can hope to keep pace with the literature to which they give rise. When, therefore, such a student takes the trouble to bring together the results of these investigations, and to publish them in an attractive and easily accessible form, his book is an offering that will be welcome to many. Our only regret is that such a book should have appeared finally in German instead of English.

Herr Boetticher, who, by the way, is not to be confounded with the author of the 'Tektonik der Hellenen' and the 'Untersuchungen auf der Akropolis, in 1862,' to whom we believe he is in no way related, has already proved his qualification to undertake such a task by his beautiful volume on 'Olympia,' which is by far the best guide to and commentary upon the large volumes of photographs of the excavations that has yet appeared. An architect by profession, his archæological spurs were won in the German expedition to Olympia, of which he was a member. Upon his return to Germany, he wrote a book which in a popular style described the history of Olympia in antiquity, and the excavations carried on there in recent times, especially, of course, the famous work in which he shared, giving at the same time a summary of the theories to which these investigations had given rise. His book was carefully and thoroughly done, and found such ready reception that a second edition was called for shortly. This success encouraged him to try a similar book on the Acropolis of Athens, with the result that we have before us.

The plan followed is substantially the same as in the 'Olympia;' that is, the subject is treated chronologically rather than topographically. Of the four parts into which the book is divided, the first is an historical sketch of the Acropolis, more especially from the downfall of paganism to the present day; the second describes it from the earliest times to the end of Cimon's administration; the third is devoted to the age of Pericles and Pheidias, and the last takes us from the year 400 B. C. into the period of Roman dominion. In this way the author gives us, as far as is possible from ancient accounts and modern investigations, a picture of the Acropolis at each of the epochs described; and the statues and reliefs which excavations have brought to light are mentioned not in the order of their discovery, but according to the epoch in which they were erected. Beulé, it will be remembered, followed the topographical method, beginning with the Propylaia and describing everything known about that locality, of whatever period, and proceeding thence towards the Parthenon.

Boetticher's book lacks the brilliancy of Beulé's; it has none of the fine descriptions which made that book such attractive reading, and it is not calculated, like that, to inspire enthusiasm for the subject in the mind of him who does not already feel it; but those who go to the book simply for information, to learn what archæologists of the highest standing know and think about the Acropolis to-day, will not be disappointed. The author says at the outset that his aim is not to produce any new doctrines, but to make as clear as possible a summary of the opinions of those who have made especial studies of the various monuments there; and the care and intelligence with which he has done this, entitle his book to high commendation. The skill with which he has stated the gist of a whole library of essays will save students an enormous amount of unnecessary reading. Investigations and discoveries upon the Acropolis are described down to the very month in which the book must have gone to press, some of the statues unearthed in 1886 figuring among the illustrations; and there is even a brief statement from Dörpfeld of his latest investigations in the Dionysiac Theatre, the results of which have not yet been published officially. Herr Boetticher's professional instincts have led him to give minute descriptions of each of the buildings from a technical point of view, in which architectural terms and measurements play so large a part as to be somewhat confusing to the layman, and therefore prevent the book from being popular in the most general sense; yet this very feature will give it additional value to architects and others who wish more than a superficial treatment of the subject.

Herr Boetticher has, in common with many of his countrymen, one tendency of which the reader should be warned beforehand, and that is a disposition to accept the latest theory as the best, merely because it is the latest. It is only on such grounds that we can understand his following Dörpfeld unquestioningly through the revels of the latter's imagination; for readers of the later numbers of the *Mittheilungen des Instituts in Athen* have learned that between Dörpfeld the investigator and Dörpfeld the theorist there is a breach which few of us are able to jump. A rather amusing instance of this tendency occurs in the description of the western pediment of the Parthenon. Those who are familiar with Carrey's drawing of this pediment will remember that near the right end of the group are two figures (usually numbered S T), one of which is seated in the lap of the other, and nude. Both are gone now, and Carrey's drawing has not left it clear whether this nude figure was male or female. Opinion at present inclines to the belief that it was male, and the popular interpretation of Aphrodite in the lap of Thalassa has gone under. So great is the fascination of the present "topical" theories, by which half the figures in the two pediments are being resolved into personifications of rivers, clouds, and mountains, that Löschke in 1884 published an essay to show that the figures S T could be none others than Herakles sitting in the lap of Melite, the object of one of the lusty hero's innumerable amours, and, at the same time, the personification of the district in which stood his principal Athenian shrine! Then the adjoining figure, Q, becomes Demeter Kurotrophos, taking care of the two children of this union, who stand at either side of her. As Herr Boetticher ingenuously remarks, this group forms "ein Familienbild, noch intimer als sie die attischen Grabsteine zeigen"; and yet, in spite of its manifest absurdity, in spite of the shockingly inartistic character of such a conception, he accepts it enthusiastically, and thinks that "jetzt erst kommt Leben und Zusammenhang in die Gruppe."

As an offset to this, however, it is gratifying to note that, notwithstanding the general upheaval of old and established opinions regarding the Acropolis which the recent investigations have occasioned, he still stands by Penrose's theories of the curvatures in the horizontal lines, and declares that Durm's attempt to prove them the result of accident was not borne out by the facts.

The illustrations form a considerable and important portion of the book, there being 168 in all. Many of them, and particularly the architectural drawings, will be of great assistance to the reader, and the plates give a very attractive appearance to the book. Two of the plates and twenty-five of the illustrations in the text were derived by permission from Durm's 'Die Baukunst der Griechen' in the second volume of the 'Handbuch der Architektur.' More of the plates were taken from Stuart and Revett's 'Antiquities of Athens' and the 'Ancient Marbles in the British Museum'; and while Stuart's drawings are always interesting to compare with the present condition of the Acropolis, we

wonder at the author's selecting the 'Ancient Marbles' as the source of his illustrations of the Parthenon sculptures, when he had at his command so many processes of reproducing them directly from the originals. Those in the 'Ancient Marbles' were drawn and engraved, and although with much of the spirit and feeling of the originals, they are not accurate enough to suit the taste of to-day. Several of them are antiquated, and so Herr Boetticher represents, in plate xxiii, the Niké without the leg which she now possesses, and, in plate xiv, the metope of the Lapith and Centaur, without the restoration published some years ago by Waldstein. And we must blame the publishers for making mechanical reproductions of copper-plate engravings and publishing them with plate-marks. This is a sort of trickery, entirely unnecessary, which is only calculated to deceive the uninitiated, and is therefore severely to be condemned. With this exception the illustrations seem to us excellently and clearly rendered, and for them hardly less than for the text itself we recommend the book to all who are interested in its immortal subject.

SOME NEW GERMAN GRAMMARS.

Deutsche Grammatik für Amerikaner, nach einer neuen praktischen Methode. Von Carla Wenckebach und Josepha Schrakamp. Henry Holt & Co.

Complete German Manual for High Schools and Colleges. By W. C. Sawyer. Chicago: Buckbee & Co.

Graded German Lessons: being a Practical German Grammar. By W. Eysenbach. Revised and largely rewritten by W. C. Collar. Boston: Ginn & Co.

A German Grammar for Schools and Colleges, based upon Meissner's. By E. S. Joynes. Boston: D. C. Heath & Co.

THE Wenckebach-Schrakamp grammar is intended especially to be used in the "Natural Method." Among novel features the authors claim the following, viz., that the rules are preceded in all cases by preliminary examples, and the large number of exercises affords ample opportunity for diversified practical application. Part i. treats of the different parts of speech. Part ii. is entirely devoted to the verbs. Part iii. contains the syntax. The appendix offers "hints about German genders and other peculiarities of the German language which will be found particularly valuable to American students." These so-called "hints" as to genders are cut-and-dried "rules," to be learned by heart and recited. Why the whole grammar should be especially adapted to the wants of Americans, is not clear. Were it not for the English preface, the work might be expected to do as well for the English, Italians, and French. It is to be feared that those who have studied German with this grammar will have to unlearn some things when they enter into the deeper, though less "natural," study of the language. Take, for instance, the statements that in the old language all verbs have in the imperfect and participle a different vowel from that in the infinitive (p. 209); that there is no ablaut (*sic*) in the imperative of verbs of Braune's sixth class; that verbs like *brennen* are partly strong and partly weak.

Prof. Sawyer's Manual is intended as an aid both in the "natural" and in the "grammar" method. The first part, the so-called "Theory," is a revision of part of the author's 'Practical German Grammar.' It covers very much the same ground as Whitney's or Sheldon's small grammar, and has a similar arrangement; but the syntax is very meagre. All these diminutive grammars are short roads to reading, and a special help to teachers who do not choose to pick out from eight to twelve lessons on essentials in Whitney's and Brandt's large grammars; they thus oblige the classes who go beyond the elementary stage to buy two grammars. Part ii. contains the "Practice," consisting of exercises for writing and oral practice, a guide to correspondence, to reformed spelling and punctuation, a list of irregular verbs and the vocabularies. In the verb-list we notice many inseparable and even separable compound verbs. At the very end of the book is a curious feature, viz., one page with a table of conjugations (the whole of *loben* and the present of *sein*), another page with a table of declensions (the articles, the adjective, personal pronoun, and a most remarkable system of three substantive declensions).

In Eysenbach's 'Graded German Lessons' we have the usual style of practical grammars of a modern language, though the reviser is not an advocate *à outrance* of the natural method. In the very long preface a good idea is emphasized, viz., that the reading "should be begun at the very earliest practicable moment, and should occupy the largest practicable place." There is a new English word, *antithete*, which is not in Murray's great dictionary in that form. There are many comparisons between Latin and German syntax which seem to us superfluous and cumbersome for such a book. In the written alphabet only the old forms of C, F, and H are given. The accent has been thoroughly given in the German-English vocabulary. If the reviser had used the grave accent for the next to the strongest stress, he could have given the pronunciation of such a long word as "Leihbibliothek" more accurately than he does. This is one of the many text-books which, it is claimed, were "born in the class-room."

Prof. Joynes has intended to make a *working* grammar, and to admit that it fulfils its scope and purpose is no small praise. The American editor is a teacher of long experience, and has once before worked over a grammar, viz., Otto's, of which it will be a formidable rival. Joynes says nothing about the natural method, to which, nevertheless, the exercises and the whole plan are as suitable as the grammars mentioned above. Part i. contains the orthography, pronunciation, and accidence; Part ii., the derivation and composition; Part iii., the syntax. The exercises are excellent, and not too numerous for students of high-school grade and for younger ones. The syntax, Joynes suggests, may be studied consecutively, or used by reference only. The latter, with the use of the more difficult continuous passages for translation into German, would be the method for college students. The skilful use of references, though frowned upon by many teachers, is a unique feature, and cannot be too much commended. It appears well in the list of strong verbs and in the vocabulary. We know of no grammar in which the noun and adjective declensions are so well grouped. The strong verbs are not so well arranged. We wish Prof. Joynes had cut loose from the old-fashioned chaotic arrangement, and adopted the classes of the scientific grammars of Braune's series.

In the otherwise very good chapter on the relation of German and English in Part ii., Grimm's law is stated by using H (hard) A (aspirate) S (soft). In this, Prof. Joynes has not got beyond Peile and Morris. The corresponding English and German sounds can be given without alluding to Grimm's law. An elementary grammar has no business with it. We expect no discussion, certainly no explanation, of the origin of life in a physiological or biological text-book. How many teachers can state Grimm's law? Look at the loose statement of it in the latest book by Skeat, in his 'Principles of English Etymology.'

The Joynes-Meissner is not a large book. In fact, it is growing quite clear that the advocates of the "grammar method," used alone or combined with the oral method, produce smaller books than the advocates of the "natural method," who once scorned all books, but now produce long and full grammars, that serve up again the stale Ollendorffian twaddle. There is no college or university in the country in which German may not be taken up from the beginning, since none absolutely requires it for admission. Freshmen and sophomores must either begin German in Brandt or Whitney, or take for eight or ten weeks a small grammar like Sheldon's or Otis's, or the smaller Whitney. They have not the time to go over the long exercise grammars, which leave them in the lurch as reference-books at the end of a year's study. Then the students are set back by having to learn new declensions and new verb-classes. They feel at sea when they have to read the severer eighteenth and nineteenth-century classics, to say nothing of the sixteenth and seventeenth-century texts, after having gone through one of those books that promised to carry them to full mastery on "palace-cars," as the *Atlantic Monthly* expressed it. Though based on Meissner's popular work, the American form of it is so far original that Prof. Joynes, by giving credit in the preface as the custom is, might well have put his name alone in the title. Some technical faults have been found by reviewers in *Modern Language Notes*, which, however, a second edition can mend.

Grant in Peace: From Appomattox to Mt. McGregor. By Adam Badeau, Brevet Brigadier-General, etc. Hartford: S. S. Scranton & Co. 1887.

THIS book shows Gen. Badeau at his best as a writer. It is a compilation of articles (revised, no doubt) which have appeared in the daily papers, each article being complete in itself. For this sort of work the author has qualifications of a rare order. As an historian he is not so highly gifted; and, though read and approved by Grant, Badeau's military history of that great General lacks the merit and attraction of the volume entitled 'Grant in Peace.' Indeed, this volume is more than interesting, it is charming. The undertaking admitted embellishment, and although some of the events are highly colored, the work is wrought out in artistic fashion, and the scenes change so rapidly that the reader is never wearied. The main facts, with some fiction, concerning Grant's intercourse with the leading people of his time in this country and abroad, are sketched by the pen of a master in that sort of work. Grant's relations to Andrew Johnson, Stanton, Sherman, Sheridan, Hancock, Seward, Motley, Sumner, Fish, Garfield, Arthur, Blaine, Logan, and other distinguished men are portrayed with remarkable clearness and vigor.

While it is true that the book is interesting throughout, it is perhaps equally true that it contains some revelations which, if true, might well have been omitted; such, for example, as those about the behavior of President Lincoln's wife during a visit to the Army of the Potomac. The author excuses Mrs. Lincoln's erratic course by the explanation that she was demented, but he fails to observe that the reason he gives for the poor woman's strange conduct affords of itself good ground for not publishing an account of it. It may be, also, that Gen. Badeau tells things about Grant's private

affairs which a confidential friend should not disclose. He seems to have some misgivings on this point, for he says: "If I tell any of his secrets now, when he cannot be pained, his silent shade will not reproach me." Caution upon this point was necessary, because, though Gen. Grant cannot now be pained by the telling of his secrets, any disclosures that could pain him if living will certainly pain his widow and children.

In some instances the author's love of pictorial writing carries him too far, leading to the creation of mere effects and to the assignment of insufficient and incorrect causes for important results. His graphic account of the surrender at Appomattox affords an illustration. He attributes the decision that the vanquished officers should retain their side-arms to the chance that Grant looked up while writing the terms of surrender, and was dazzled by Lee's beautiful sword, presented by the ladies of Virginia. "The glitter of the rebel weapon," says the author, "suggested to Grant to spare the conquered the humiliation of surrendering it." That is very picturesque, but the plain truth is, that Grant in the matter of side-arms treated Lee at Appomattox just as he had treated Buckner at Donelson and Pemberton at Vicksburg, and the glitter of Lee's jewelled weapon had nothing to do with it.

The account of Grant's visit to England is especially pathetic. "He was my chief, my general, my friend," says the author. "He threw his arms around me—and I kissed him. I was with him incessantly during his stay in England. He wrote at once a telegram to the Government asking that I might be permitted to accompany him," etc. Grant's account of this omitted the hugging and kissing, and was to the effect that Badeau devised the scheme to have himself detailed to accompany Grant in England; and that Badeau prepared for Grant's signature the cable message asking the President to make the detail. As a joke on Badeau, Grant used to tell how the diplomatic secretary upon this occasion wheedled him out of his money as well as his name. After Grant had agreed that his name should be put to the message, Badeau said, "General, it will cost about twenty dollars to send this cable, and, to make the despatch *yours in every respect*, you had better give me the money to pay for it." Grant, unable or unwilling to resist the sharp logic of the situation, "smiled a sickly smile" and handed over the money.

Gen. Badeau's chapters on Grant and President Johnson are of surpassing interest, shedding as they do a clear light upon one of the most critical periods in the history of the country. It is almost impossible to realize that Grant possessed the personal qualities to take the part he did. Down to that time he had been a soldier and nothing else. Brought up in the school of discipline, obedience to the orders of the authority appointed over him was not only his creed, but his habit. Yet as General of the Army, standing face to face with the President of the United States, he flatly refused to obey the orders of his constitutional commander in chief. The explanation is, that Grant acted upon his own conviction that the President's course was treasonable, and that he must save the country, not only from the danger of the President's conduct, but also from the danger of charging the festering treason he felt sure he had discovered in the highest quarter. He therefore took upon himself in silence the appalling task of thwarting the Chief Magistrate without exposing him. Forced by his own sense of duty to his country to disobey the orders of the highest military authority in the Government, and deterred by his own judgment from announcing the danger that threatened, Grant's responsibility and peril are without a parallel in our history. "Stanton," said Johnson to Grant, "holding the office of Secretary of War, is not and cannot be the President's mouthpiece in military matters, and therefore," said the President in person to the General of the Army, "I order you not to obey *him*, but to come to *me* for orders." The President's assertion of Stanton's lack of authority was a stern fact, and was unanswerable. Grant's reply to the President was, "Give me that in writing"; and he left the august presence, and continued to obey the Secretary of War. What effect the President's written orders would have produced cannot be told: they never appeared in that form. There is not a more striking chapter in the history of the time than Gen. Badeau's account of all this.

If Gen. Badeau had witnessed the last scenes of Grant's life, no pen so well as his could have depicted them for history. But he was not at Mt. McGregor. The truth long kept back has recently been brought out by Gen. Badeau's own action. Nearly three months before Grant's death, the intimacy of years between them was suddenly broken, and the estrangement that followed continued without abatement to the end.

A Manual of North American Birds. By Robert Ridgway. Philadelphia: J. B. Lippincott Co. 1887. Large 8vo, pp. xii, 632, pll. 124.

WHAT is most surprising in this case is that a publisher could be found to print a book in the form of this one, upon any pretext or for any purpose. The arrangement of the paragraphs is unfortunate in two respects. The exigencies of printing a large set of analytical tables, such as those of which the work entirely consists, require a good deal of blank space, but nothing like the amount of it we find here, where the "hanging" of successive paragraphs often reduces the text to a narrow column of type meandering down the right-hand edge. To such an extent is this carried, that what is probably only a sad lack of skill in making copy acquires the appearance of an attempt of the publishers to pad the matter of a handy little duodecimo into a bulky octavo. It is safe to say that more than one-third of the type-bed itself is left blank, to say nothing of a generous width of margin. This waste paper would have fully accommodated the whole 464 outline diagrams, which have been disadvantageously printed on 124 additional pages, still further increasing the bulk of the volume by about one-fifth of its thickness. Such disposition of text and cuts may be looked for in works *de luxe*, but is inappropriate to a technical handbook, one of whose distinctive characters is that it should be handy. Properly printed, the manual would have made a tidy small octavo of less than half its present size and price—which will together, we fear, prove an insuperable obstacle to the success of the book.

The substance of the Manual is entirely tabular, consisting of analytical tables of the technical characters of the orders, families, genera, and other groups of the birds of North America, constructed on the antithetical principles first brought into vogue by Dr. Coues in 1872. The analysis is pushed to the extreme, the ultimate subdivisions of species (inappreciable except to the trained expert) being formulated with much precision. The work will thus prove of great value to the specialist, though we fear that it presupposes in all cases an extent of information possessed by few students or amateur ornithologists, and certainly by no appreciable fraction of the public. This is unfortunate, since it restricts the use of the work to the professed ornithologist, who will chiefly use it as a means of refreshing his memory on vexed technical points. Mr. Ridgway has "the eye of a hawk" for a shade of color or a hairline of form, and is at his best in the ultimate discrimination of subspecies. In such matters we have probably no higher expert authority to fall back upon; and the wholly exceptional facilities he has enjoyed for many years in handling the greatest collection of American birds in the world—that of the National Museum, of which he is the ornithological curator—give him a right to speak as it were *ex cathedrâ*. He is, however, less happy in treating the broader aspects of the subject, either from narrowness of view or of immaturity of the critical faculty; and we are pained to see into what lapses so well trained an ornithologist has fallen in his treatment of the higher groups.

For example, in the "key" to the higher groups with which the work opens we first find the alternative: a^1, "Hind toe connected by web," etc., and a^2, "Hind toe not connected." This is well enough for all four-toed birds, but how about birds without any hind toe? A student with one of our many three-toed birds in hand, which he wishes to identify, is baulked at the start; for the "key" has no keyhole. The very next sentence reads: b^1, "Nostrils tubular"; b^2, "Nostrils not tubular." Now, the only place where a student who has in hand a bird with four toes, the "hind toe not connected," and "nostrils tubular," can fetch up is at *Tubinares*, the petrel family, where Mr. Ridgway intended to send him safely; yet the bird in hand, fulfilling these requirements, might be a caprimulgine, of an entirely different order. The very next pair of alternatives, namely, nostrils non-tubular and cutting edges of bill c^1, "serrated," and c^2, "not serrated," should bring him up at *Anseres*, the ducks and geese; yet the bird in hand, with hind toe free, nostrils non-tubular, and tomia serrate, might be the blue-headed sawbill, *Momotus cœruleiceps*, described on page 278. Mr. Ridgway knows this, of course, as well as any other ornithologist; but the persons whom the book is designed to teach do not, and are therefore left in the lurch.

Much of the analytical work of the book is open to similar exceptions, requiring from the reader almost the author's own skill in sailing safely past the snags with which the narrow channel is filled; but in general, Mr. Ridgway being best in the least details, his ultimate diagnoses of species and conspecies or subspecies leave little to be desired. Here his work is exhaustive, and will, as it should, be accepted as authoritative among the experts to whose use it is almost necessarily restricted.

The classification and nomenclature adopted are uniformly those of the "Code" recently prepared by a committee of the American Ornithologists' Union, of which Mr. Ridgway was a member. This is much the best scheme we have, and its general acceptance by ornithologists has gone far to bring about uniformity and precision in nomenclature. We could wish, however, that Dr. Coues's committee had not in their wisdom carried their thirst for "uniformity" to the extent of Canon XL, which provides that "the original orthography of a name is to be rigidly preserved, unless a typographical error is evident." That is to say, the printer must not misspell words, under pain of correction; but the author may do so, under pain (to us) of having his orthographical misdemeanors "rigidly preserved." This is little short of fetishism. So Mr. Ridgway bows to the *Cerorhinca* of Prince

Bonaparte, which by no stretch of a spelling-bee could be got beyond *Cerorhyncha*, as a possible form of what ought to be *Ceratorhynchus*. So, again, the first suborder of Mr. Ridgway's book is *Podicipedes*, which is correct, the first family of that order being *Podicipidæ*, for which read *Podicipedidæ*, if there be any virtue in a way of compounding *podex* + *pes*, and adding the family suffix = *idæ*. On a wrong theory, that the basis of this word is *Podiceps*, the derivative family name would be *Podicipitidæ*. Now Mr. Ridgway uses *podiceps*, which is unquestionably a spurious form of *podicipes*; then he incorrectly inflects his family *Podicipidæ* from the incorrect form *podiceps;* and then correctly inflects his suborder *Podicipedes* from the correct form *podicipes*, which he does not use.

The work describes 768 full species and many additional subspecies, referred to nearly (as we estimate without counting) half as many genera or subgenera. The analyses include in many cases related extralimital forms from any part of the world, though chiefly neotropical. Four new subgenera and thirty-nine new subspecies are characterized. Eight genera or subgenera and thirty-one species or subspecies are additional to those admitted by the American Ornithologists' Union 'Check-list.' The book is fully indexed, as to both technical and vernacular names, in a manner identical with that adopted in the later editions of Coues's 'Key.' The frontispiece is a portrait of the late Prof. Baird, to whom the work is appropriately dedicated.

Life of Oliver Goldsmith. By Austin Dobson. London: Walter Scott; New York: Scribner & Welford.

"THERE will come a day," wrote Goldsmith to his friend Bryanton (in a letter quoted on p. 54), "no doubt it will—I beg you may live a couple of hundred years longer only to see the day—when Scaligers and Daciers will vindicate my character, give learned editions of my labors, and bless the times with copious comments on the text." It is not yet a couple of hundred years since this letter was written, it is barely a century and a third, and yet what Goldsmith humorously predicted has actually come to pass. And, of a truth, he has been ever more fortunate than he dared to hope; his character, not needing strict vindication, has been most sympathetically portrayed by more than one master of the art of biography. Instead of Scaligers and Daciers, he has been edited by the more gentle hand of Mr. Austin Dobson. For the "Ideal Series," Mr. Dobson prepared the 'Vicar of Wakefield' with an introduction as elegant as the notes were learned and abundant; to a facsimile of the first edition of the same classic he contributed a preface full of new facts as to its original publication; Mr. Abbey's beautiful edition of 'She Stoops to Conquer' was adorned by one of Mr. Dobson's most felicitous poems; and almost the latest issue of the Clarendon Press Series is a volume of Goldsmith's 'Selected Poems,' edited with introduction and notes by Mr. Dobson. By all these preliminary labors the present biography has profited. To the writing of Goldsmith's life for the "Great Writers" series Mr. Dobson has brought a minute and exact knowledge of all the facts in the poet's career, resulting from a long and loving study of Goldsmith in particular, and of the whole eighteenth century at large. These are qualifications conspicuously lacking in Mr. William Black, who "did Goldsmith" for the "English Men of Letters" series, and who turned out a very perfunctory book, to which perhaps no volume in that generally admirable series is inferior, except Mrs. Oliphant's unspeakable "Sheridan." This is, indeed, Mr. Dobson's fifth contribution to the biography of the eighteenth century, and it seems to us to be easier in composition and richer in matter than either the Hogarth or the Bewick, the Steele or the Fielding.

In an appendix are given three hitherto unpublished letters of Goldsmith's from the collection of Mr. Frederick Locker-Sampson; and there is the usual elaborate and ample bibliography, by Mr. John P. Anderson of the British Museum, which lends a special value to all the books of the "Great Writers" series.

Essays. By the late Clement Mansfield Ingleby, M.A., LL.D., etc. Edited by his son. London: Trübner & Co. 1888.

THESE papers, upon literary or metaphysical topics, show a strong individuality in the author, and, if his mind is not to be called original, it was one which reacted with great vitality on what he read. Criticism is too often merely parasitical, but in this volume there is no room for such reproach. The most important article is one upon Bacon, in which the question is raised whether his "method" was really of such scientific value as has been ascribed to it, and the discussion favors the negative view. Other papers, upon Coleridge, Wordsworth, and De Quincey, are admirable for their temperate appeciation, and noticeable for their pervasive good sense. A metaphysical and scientific inquiry as to the perception of the rainbow is a most interesting example of such reasoning, and it is conducted through two articles, one in the form of the dialogue and one expository. But to us the most valuable paper is that entitled Law and Religion, in which there is a broad grasp of the historical evolution of man's moral consciousness, and, besides, occasion is found for many suggestions of a far-reaching and wise kind in respect to religion as primarily a regenerating power. The volume is somewhat hard reading, the fruits of a well-stored and highly trained mind, much given to difficult problems, and with an unrelaxing logical hold on the facts of the discussion. This makes it very notable among volumes of essays in which such vigor is seldom found and such attention from the reader is not usually required. The matter, however, is too various, and the lines of thought are too briefly followed, to allow one to discuss the author's work in a general way, and we must content ourselves with recommending it as a solid book for readers who do not grudge giving the assistance of their own thinking to the writer whom they read. We will not close, however, without mention of the humane plea for kindness to animals, and protest against the cruelty of English sport, with which the book ends.

Doctor and Patient. By S. Weir Mitchell. Philadelphia: J. B. Lippincott Co.

To be ill is one of the ordinary experiences of life. Loved and lover are scarcely more common factors in the social problem than the sick and those who would heal them. The professional literature of medicine is vast, but in it the sick are treated impersonally, and little speech is made of or to the physicians themselves, except in the general sense of agents for the administration of remedies. Generally speaking, the materia medica has precedence over the administrator, and the disease rather than the diseased is discussed. Still, wise physicians treat patients rather than diseases, which indeed has been set down as distinctive between English and French medicine.

It has been reserved for Dr. Mitchell, in his fulness of experience and with his exquisite literary taste, to present under the title of 'Doctor and Patient' (literally teacher and sufferer, and thus wisely chosen), a group of essays for popular and profitable reading upon this general theme. As the real patient is a sufferer, always in body and generally in mind, so is the true doctor a teacher, who by application and precept lifts him upon a higher plane. Dr. Mitchell examines and reports upon the physician from a physician's point of view, drawing a philosophic but delightful sketch of the higher type; and looks upon the invalid binocularly, as a convalescent and as a doctor, and thus throws him into stereoscopic relief. Various historical notes in relation to both men and things add interest and value. But he does not say, as he might have done, that, in the progress of science, his versatile father about fifty years ago made, or tried to make, observations on temperature in disease, experiments in medical thermometry, but was foiled by the want of sufficiently delicate instruments.

Much of what the book contains relates to the weaker and dearer portion of the race. He says, "I take women as they are to my experience," and "she is physiologically other than the man"; but he does not discuss the cause thereof. The lessons that this wise doctor, this most excellent teacher, delivers from these premises, every woman, and every man interested in a woman, may read with pleasure and ponder with profit. We quote nothing, chiefly because the mosaic of ideas is so cunningly inlaid that no one fragment will give any reasonable conception of the whole. Wisdom and humor are inwrought side by side, and Dr. Mitchell nowhere purposely tells the whole story, for, as he himself says, "the best readers are in a measure coöperative authors, and may be left to interpolate the unsaid." We hope that to be such colaborers will be the pleasure of many.

BOOKS OF THE WEEK.

Alford, Rev. H. The Queen's English. 6th ed. Scribner & Welford.
Barr, Mrs. A. E. Master of His Fate: A Story. Dodd, Mead & Co.
Calogeras, N. Euthymii Zigabeni Commentarius in xiv Epistolas Sancti Pauli et vii Catholicas. 2 vols. Athens: Perri Brothers.
Clayden, P. W. Early Life of Samuel Rogers. Boston: Roberts Bros. $1.75.
Crane, Rev. O. Virgil's Æneid, translated literally. Baker & Taylor Co.
Don't. Boudoir ed. D. Appleton & Co. 30 cents.
Edwards, H. S. The Prima-Donna: Her History and Surroundings, from the 17th to the 19th Century. 2 vols. Scribner & Welford.
Ernst II. Aus meinem Leben und aus meiner Zeit. Band I. Berlin: Wilhelm Hertz.
Fiske, H. G. The N. Y. *Mirror* Annual and Directory of the Theatrical Profession. N. Y. *Mirror* Office. $1.10.
Forster, J. Ellen. The Crime against Ireland. Boston: D. Lothrop Co. 60 cents.
Freeman, Prof. E. A. William the Conqueror. Macmillan & Co. 60 cents.
Ingraham, J. P. T. Why We Believe the Bible. D. Appleton & Co. 30 cents.
King, W. F. H. Classical and Foreign Quotations. Thomas Whittaker. $1.75.
Kneeland, Dr. S. Volcanoes and Earthquakes. Boston: D. Lothrop Co. $2.50.
Ladd, Prof. G. T. What is the Bible? Chas. Scribner's Sons. $2.
Larisun, Dr. C. W. Solomon'z Song. Ringos, N. J.: Fonic Publishing Hous.
Leland, C. G. Practical Education. London: Whittaker & Co.
Lear, H. L. S. Henri Dominique Lacordaire. New ed. E. & J. B. Young & Co. $1.25.
Levi, Prof. L. International Law. D. Appleton & Co. $1.50.
Lintilhac, E. Beaumarchais et ses œuvres. 8vo. Paris: Hachette; Boston: Schoenhof.
Lloyd, A. P. Law of Building and Buildings. Boston: Houghton, Mifflin & Co. $4.50.
Mann, Rev. C. Five Discourses on Future Punishment. T. Whittaker. 75 cents.
McNally, D. R., jr. Irish Wonders: The Ghosts, Giants, &c., of the Emerald Isle. Boston: Houghton, Mifflin & Co. $2
Merriman, Helen B. What Shall Make Us Whole? Boston: Cupples & Hurd. 75 cents.
Palmer, A. J. Divorce Abolished. Minneapolis.
Palmer, E. Chirography, or, the Art of Telling One's Character by Handwriting. G. P. Putnam's Sons. 50 cents.
Patterson, Capt. H. The Yachtsman's Guide. New ed. New York Navigation School. $5
People's Year-Book and Traveller's Companion. Brentano's. 25 cents
The Forum. Vol. IV. Forum Publishing Co.

The Nation.

NEW YORK, THURSDAY, APRIL 12, 1888.

The Week.

THE deadlock in the House of Representatives, caused by the filibustering on the Direct-Tax Refunding Bill, has taken the country quite as much by surprise as the sudden attack of "fits" in the Senate respecting silver. It is plain to everybody that the Direct-Tax Bill was not demanded by any considerable public sentiment in the North. The direct tax on the States was one of the costs of the war, and one of the very smallest of them. It amounted to about $17,000,000, while the income tax alone reached $61,000,000 in a single year. The attempt to return it to the rich States of the North, while defensible on strict legal and constitutional grounds, is unbecoming, to say the least, and is well calculated to excite a feeling of exasperation among the States which get no part of the money. Yet the practice of filibustering to defeat the will of the House is unmannerly, and in some sort revolutionary, and is quite as exasperating to the majority as the bill itself is to the minority. The situation is certainly one of much complexity, but we see no way out of it except by enforcing the right of the majority to govern. At the same time we think that it would have been much better if the Direct-Tax Bill had never been introduced.

The Senate on Thursday passed the Bond-Purchase Bill, having stricken out the whole of the text as it came from the House, and substituted first a clause merely interpreting the existing law authorizing the Secretary of the Treasury to purchase bonds with his surplus money—interpreting it as a continuing authority not limited to the occasion which led to its passage in 1881; and, second, a clause requiring the Secretary to purchase and coin silver bullion to the amount of national-bank notes hereafter retired—this to be in addition to the amount required to be purchased and coined under the Bland act. Senator Sherman made a very strong speech against this amendment. His most telling argument was that this was mischievous and hasty and unnecessary legislation, and calculated to alarm the business community, and therefore to depress trade and industry. Mr. Allison sought to answer this perfectly correct statement of the situation by showing that the coinage of additional silver would be very small, and that it could have no baneful effect until the foreign exchanges turned against us. In this contention Mr. Allison was right, but the force of Mr. Sherman's objection was not lessened a jot thereby. It is true that the business community are alarmed by this sudden revival of the silver madness, unheralded by any public demand or agitation. It is a most unsettling vote that the Senate has given on these questions, and although the amount of concrete mischief that can be pointed out is small, the "want of confidence" on the part of the business public that it entails is large.

We repeat that there was no public demand or agitation on the silver question in any part of the country. Of course the silver-mining companies are always agitating to have the Government buy more of their stuff. Their Senators can always be depended on to put a rider of this sort on any bill that comes along which has a remote resemblance to the money question. Then, Senators like Beck are always ready to start an agitation which would not exist without the exercise of great wind-power on their part, to fool the "poor man" with the notion that he would be better off with a depreciated currency. Absolute silence and content pervaded the country as to this question until the present inflammation broke out in the Senate. The silver coinage was going on in excess of the wants of the public for currency purposes. Nobody was short of money who had anything to sell or any security to offer for the use of it. The only danger in the financial situation is the horrid Treasury surplus, the vortex that is sucking money out of business channels at the rate of eight or ten millions per month. When this condition of affairs is represented to the Congress in a temperate way by the President, the response of the Senate is, that he had better buy some more silver, although the Treasury has an unused surplus of $54,000,000, and is calling on Congress at every session for more vault-room to hold it. The opportunity is now offered to the President to rally the common sense of the country by a veto, and we hope he will not neglect it.

The House Committee on Revision of the Laws has reported in favor of an amendment to the Constitution providing for the election of United States Senators directly by the people, as State officers are chosen. The theory is that unfit millionaires could not then so easily buy seats, and that corporations would find it harder to send their agents to the Senate. There is a certain plausibility about this view, but there is another side to the case, which, upon examination, will be found much stronger. It is complained that unfit men get elections to the Senate under the system of legislative choice, but in order to justify a change, it would be necessary to show that only fit men get elected to State offices by the system of popular choice. As a matter of fact, everybody knows that it is on the whole easier for a man to capture, by purchase or intrigue, a party nomination which means an election to a Governorship, for example, when he only has to "fix" the caucuses which choose the delegates to a large State convention, than it would be if he had to submit h claims to a comparatively small body of legislators. It is hard enough, as everybody knows, to hold the average legislator to a sense of responsibility, but it is much easier than it is in the case of the average delegate to a convention. The legislator has to stand up and vote openly for a Senator, with the knowledge that his constituents have their eyes upon him; but the delegate is subject to no such scrutiny, and can suffer no such penalty for betrayal of his trust.

The Judiciary Committee of the House has made an adverse report upon a joint resolution providing for an amendment to the Constitution extending the term of the President from four years to eight, and making the incumbent ineligible to reëlection. The policy of extending the term either to six years or eight, and forbidding re election, has been canvassed for many years, but it appears to lose rather than gain in popular favor. Aside from all other arguments against such a change, there is one which is perfectly conclusive so long as we nominate Presidential tickets in the present way. Experience has shown that a President may die within a month of his inauguration, and the duties of the office thus devolve upon the Vice-President for almost the entire term. But the Vice-President is nominated without any reference to the possibility of his exercising the executive power for nearly four years, and almost invariably a man is chosen for the second place on the ticket who would not be thought of for the first place. After spending days, perhaps, in deciding upon the candidate for President, the weary delegates put up somebody for Vice-President in a hurry, and almost without thought. Mr. Arthur served as President nearly three years and a half because he had been hit upon as a candidate for Vice-President by a majority of the New York delegation, but nobody in the Convention ever thought of Mr. Arthur as a possible President. So long as we keep on selecting possible Presidents in this haphazard way, a proposition to lengthen the term means simply to aggravate the ever-present danger of having a man in the White House for a long time whom nobody thought of putting there when he voted for President.

Most of the talk about Mr. Cleveland's inability to accept a second term, because he said in his letter of acceptance that he thought a second term a bad thing, is rather sad stuff. Mr. Cleveland is not charged with the duty either of amending the Constitution or of changing party practice in the matter of Presidential eligibility. He may, like any other citizen, hold any opinion he pleases about the existing law or usage, and he may, like any other citizen, vote for a change, or labor to bring it about; but he has no right to try to impose his opinions on the rest of the community by refusing to accept any office which the majority of the voters ask him to take. If his views about second terms made it proper for him to decline a

renomination on the ground that no one ought to serve more than one term, it would also make it proper for him, if he had the power, to prevent any one else from serving a second term, even if elected by a unanimous vote—that is, he would be justified in withdrawing from the public service, no matter how generally called for, anybody whose conduct he could control as he controls his own. But nobody has a right to express his opinions about constitutional questions in this way, any more than by resort to armed force. Mr. Cleveland's opinions about renominations are of just the same value as those of any other citizen, and no more. If he is called on to serve, he must serve, just as he would have to serve in the army in time of war, in spite of decided disapproval of the present law of compulsory retirement, or of the length of the term of enlistment.

The *Sun*, after quoting various newspapers on the question of Mr. Cleveland's accepting a nomination for a second term, in spite of the condemnation of a second term in his letter of acceptance, says:

"We have sufficiently exhibited the weakness of all these defences, volunteered in advance, of an act of self-stultification and selfish tergiversation which would be almost without a parallel in the history of our politics."

No, it would not, even taking the worst possible view of it, be without a parallel in the history of our politics. Your own history furnishes a good parallel to it, for you volunteered on the 29th of June, 1884, the following promise:

"Sooner than join in making James G. Blaine President of the United States, we would quit work, burn up our pen, and leave to other and perhaps rasher heads the noble controversies of politics and the defence of popular self-government."

In spite of this promise you did not "quit work or burn your pen, or leave to other and perhaps rasher heads the noble controversies of politics," etc., etc., but you did join in trying to make Blaine President, by running Butler as a candidate of your own. Moreover, Mr. Cleveland, in case he accepts a renomination, will yield to pressure from large bodies of his countrymen, while you failed to "burn your pen," etc., out of your own head, of your own mere motion, and without any regard to the effect of your breach of faith on anybody but yourself. You are consequently now in the position of a man who has made his escape by breaking his parole, or, in other words, of a journalistic outlaw whom a hostile contemporary like "Judas" might lawfully, in any forum, slay on sight.

The minority report of the Ways and Means Committee on the tariff made a touching appeal for more protection to lime. This article is produced by the paupers of Canada to some extent, and enters our country at a beggarly duty of 10 per cent. Our forests are not so dense as they once were, and it is well known that the burning of lime depends in some degree upon the supply of timber for fuel. What with the great supply of paupers and timber in New Brunswick and Nova Scotia, the lime-burners of Maine are represented to be in a bad way, and to need the stimulus of a higher duty on their product, so that they may speedily cut down the remaining trees at a good profit and charge the extra cost to the house-builders along the Atlantic seaboard. And now another cloud appears on the horizon no bigger than a man's hand, but likely to spread over a large part of the firmament. It is the perilous condition of curled hair, the article which enters into the composition of mattresses, and is protected by a duty of 25 per cent. ad valorem, but which the Mills bill puts in the free list. One reason for not putting curled hair in the free list, as stated in a Philadelphia paper, is, that "curled hair is used almost entirely by the wealthier classes, and the proposed abolition of the duty would not, therefore, remove any burden from the mass of the people, but would simply benefit the manufacturers of the article in Europe at the expense of those in our own country." The answer to this is, that if the mass of the people are obliged to sleep on straw beds and corn-husk mattresses, like the pauper laborers of Europe, perhaps it would be well to give them a chance to buy hair mattresses by knocking off 25 per cent. of the cost of them.

The new ballot law in Wisconsin went into effect at the recent election in Milwaukee, and worked with entire success. The law, while not so comprehensive a measure as that proposed in New York, Massachusetts, and other States, is notable as the first application of the principle of ballot distribution by the State. It contains also novel provisions for securing entire secrecy in voting. It provides for a ticket-room and a voting-room at each election precinct, with a hall or passageway between. The voter receives his ballots from the sworn State election officers in the first room, which only one voter is allowed to enter at a time, and passes alone to the voting-room, where he deposits his ballot and goes out of a door provided for that purpose. No crowd of persons is allowed to collect within 100 feet of the polling-places, and no person is allowed to offer tickets or solicit votes within the same distance. The result at the recent election, which was an unusually exciting one, is thus described by the Milwaukee *Sentinel*:

"The system of voting in Milwaukee has proved a decided advantage over that which formerly prevailed. Under the old system, with such an issue as divided parties on Tuesday, there would inevitably have been more or less trouble at the polls. Voters would have been kept from the polls by intimidation, there would have been knock-downs and broken heads. All this was avoided by the arrangement that allowed each voter to select his ballot without interference, to enter alone the room where the ballot-box was kept, and which provided for his passing out immediately by another door than that at which he entered. It broke up the business of ticket-peddling, of browbeating ignorant voters, and secured a perfectly orderly and quiet election."

The full effect of the new suffrage amendment to the Rhode Island Constitution, which was adopted at the recent election, will not be felt for three years. It abolishes the property qualification which has heretofore existed, requiring every foreign-born citizen to own $134 worth of taxed property before being permitted to vote. There are over 31,000 foreign-born citizens in the State, but as they could not vote even if they were naturalized, only a few except those having the necessary property have taken the trouble to be naturalized. There were less than 5,000 who had paid the necessary taxes and were qualified to vote at the last election. About 4,000 others had been naturalized, but were not able to vote because of the lack of property. The remaining 24,000 have never been naturalized, but must be before they can register and vote. The law requires registration in December for voting in the following year, so that only the 4,000 already naturalized will be able to get on the registry list and vote next year. It is estimated that at the election three years hence at least 20,000 new voters will take part. This will be an increase of fully one-third in the total vote of the State.

While a place on the Supreme bench of the United States remains vacant, the court renders still another in its long series of recent decisions affirming State rights, and demonstrating that this ancient issue between parties is settled. A Pennsylvania statute makes it unlawful for any person to manufacture or sell any imitation of butter or cheese, and an oleomargarine manufacturer was convicted in the State courts of violating the act. He appealed to the Federal Supreme Court, on the ground that the statute was in violation of the Fourteenth Amendment, and that the article sold was not deleterious to the public health; but the highest tribunal sustains the judgment of the State court. The court holds that it is entirely within the police powers of the State to protect the public health, and that the questions whether the manufacture of oleomargarine is or may be conducted in such a way as to involve such danger to the public health as to require the suppression of the business rather than its regulation, are questions of fact and of public policy which belong to the legislative department to determine; in short, that the Federal authority cannot interfere. "State rights with a vengeance," the *Herald* not unnaturally styles this decision, for it may be doubted whether the power of the State has been more strongly affirmed in any previous decision. All the Republican judges concurred in this latest vindication of State rights, and the circumstance lends added weight to the recent remark of the Montgomery (Ala.) *Advertiser*, a Democratic newspaper published in the city where the Confederate Government was established, that Republican papers need not be concerned as to the appointment by a Democratic President of a State-rights judge, inasmuch as "a majority of the Republican judges have recently joined in support of as thorough State-rights opinions as any Confederate will ever advance."

An interesting and valuable article upon the way in which nominations for office are made in this city, is contributed by Mr.

Abram C. Bernheim to the *Political Science Quarterly* for March. He shows from official statistics what an absurd travesty of a deliberative assembly the present primary is. Less than 8 per cent. of the Republicans who voted at the election in November last took part in the party's primaries. In some districts only 2 per cent. took part. The Democratic percentage was less than 10 per cent., so far as the figures to calculate it could be ascertained. Low as these percentages are, they do not tell the whole story. If the few men who came together had any free will of their own in making their nominations, the case would be bad enough, but, as a general thing, they have none whatever. They assemble and do the bidding of the district leader or boss in electing so-called "delegates" to the county convention. When the county convention assembles, its members simply await orders from the head boss of the city organization, and nominate the ticket which he and his assistants have agreed upon. So far as popular representation or deliberation enters into the final act of nomination, the whole proceeding might just as well have been done off-hand by the boss, without a primary or convention of any sort. It is time that the whole system were abolished. We might as well have the nominations made openly by committees of each party, without circumlocution of any sort. The only check which we have upon nominations is the power of defeating those which are unusually bad. It is useless to hope for improvement of the primaries. Respectable people have been importuned for years to go into them, but very few will do so. Mr. Bernheim shows that the new law for the regulation of the primaries is practically a dead letter on the statute-book, as it was foreordained to be.

The second stage in the Chicago, Burlington and Quincy strike has been reached by an offer of the strikers "to go back in a body." This usually comes after three or four weeks of subsistence on the funds of the union. After this comes the offer to go back individually as soon as there are vacancies, in case the strikers are not "blacklisted"; and lastly the strike is declared "off," and the strikers are left to find employment anywhere they can, and the managers return to their comfortable homes and get their bank books balanced. The latest hope was that, after the raising of the switchmen's "boycott," the C., B. and Q. would be so overwhelmed with business that the inefficiency of the new hands would be thoroughly revealed, and then something would happen. There is something pathetic about the childishness of all this.

There is nothing particularly interesting in Jacob Sharp's career as an individual. He rose into prominence and wealth through the qualities which in this country so often stand "the poor boy" in good stead. He was hardly to blame for having so little political conscience, because he had had but little teaching of any sort in his youth, and in his manhood found that most of the people with whom he had to do had their price. Politicians and office-holders were to him what the robber barons on the Rhine were to the peaceful traders passing down the river—people who had to be "squared" if any business was to be done. This view of life, if he had stuck to it boldly to the end, would probably have carried him through his Broadway railroad troubles with much less damage to health and character. Unluckily for him, he abandoned it, or tried to conceal it, before the Senate Committee of Investigation. If he had there frankly confessed that he had bribed the Aldermen as the only way to carry out an undoubted public improvement which he had long had at heart, we believe he would have won public indulgence, if not sympathy. But his cynical and plainly perjured denials, and his fierce defiance of everybody who maintained that municipal councillors ought not to sell city franchises and pocket the money, raised a storm of indignation which subjected him in his old age to the humiliation and anxiety of a protracted criminal trial and long imprisonment, and almost surrounded his deathbed with the police. The story of his life is, on the whole, a pitiful one, the moral of which every one can draw for himself.

What probably most interests those who spend any reflection on it is the question, whether this city is or is not becoming a less promising field for the activity of that curious combination of jobber and politician of which Tweed and Sharp were prominent types. We think on the whole that the opportunities of such men have greatly diminished, and are diminishing. There was steady deterioration in city politics after the adoption of universal suffrage in 1846, down to 1870, beginning with a Mayor like Fernando Wood, and ending with one like Oakey Hall. Since the downfall of the Tweed Ring the progress has been on the whole upward. The Mayors have been respectable and improving, and the list of things the Aldermen have to sell has been steadily cut down. Sharp's exploit led to their being deprived of the last valuable thing they had in stock, and undoubtedly aided in the election of the present Mayor, who, with all his faults, must be admitted to be probably the highest type of man we have had in that place for half-a-century—the most civilized and enlightened—without meaning to be in any way disrespectful to some of his immediate predecessors. The government of the city is now lodged in a body of men—the heads of departments, familiarly known as "the Mayor's Cabinet"—who are probably as competent for their work as any similar body in the world, or would be if it were not for the legislative interference at Albany.

Mr. Balfour apparently does not make much progress in Ireland, judging from the doings on Sunday. One great object of the Coercion Act is, of course, to make people either afraid to hold meetings or unwilling to hold them. There appears, however, to be no difficulty in getting up a meeting anywhere, and what the police do is simply to prevent any speaking, and after some fisticuffs and cudgel-play and bayonet-charges the crowd disperses, but it disperses in an exasperated, uncowed frame of mind. In fact, the experience of every month shows that the only true way to produce the appearance of tranquillity in Ireland at which the present Ministry aims, is the use of firearms on the crowds. Irishmen will not assemble in crowds if they are sure to be raked with musketry or artillery, but they will assemble as long as they have nothing to fear but fights with the police. But Mr. Balfour dare not use firearms, and so the silly game goes on as it has gone on for one hundred years.

The opinion of some of the best observers in England is that war in eastern Europe is among the strong probabilities of the present summer. The intrigues of Russia in Rumania indicate clearly enough that she is trying to provide a safe passage for her troops through the Principality, as in 1877, and the confusion in France seems to promise a situation from which both the friends and enemies of the Republic may be glad to seek refuge in a foreign war. Germany is but ill prepared for such a conflict, owing to the condition of the Emperor's health, the general ignorance as to the real character and capacity of his successor, the age and growing infirmity of Bismarck, and the disappearance from high places of nearly all the military strategists whose powers were tested in 1870. Another sign of the times is the increasing turbulence of the Bosnian Slavs, who have several large bands in the field holding their own against the Austrian troops, some say under Servian, but others, and probably the better informed, under Russian instigation, as part of the Panslavic movement.

The rumors of Prince Bismarck's approaching resignation of the Chancellorship apparently find some credence in Europe. It would undoubtedly be a serious matter, in the existing state of European politics and of the German Emperor's health — so serious that one can hardly believe that it will be accepted, or that he will insist on it. One of the peculiarities, and it may be added misfortunes, of his policy and position is that the public knows of nobody fit to take his place. He has suppressed ruthlessly not only all opponents, but all competent critics of himself or his work. He has, in other words, no political heirs. Consequently, search for a successor would literally have to be made. Under these circumstances it is hardly likely that as loyal a man as he is would, in spite of his seventy-three years, desert his post when the throne is occupied by an invalid, in the face of serious foreign complications. The latest despatches, in fact, announce that he will not resign, and that the proposed marriage of the Princess Victoria with Prince Alexander, formerly of Bulgaria, which is supposed to have offended him, is postponed.

THE PRESIDENT AND HIS PARTY IN NEW YORK.

After the action of the Democratic State Committee on Thursday there is likely to be little further dispute about the popularity of the President with his party in this State. His supporters controlled the Committee easily, and had this city fixed upon as the place for holding the State Convention because they regarded it as the stronghold of Cleveland sentiment. The ballots showed, what was pretty well known before, that the County Democracy and Tammany, as well as the Brooklyn Democratic organization, are unitedly and heartily in favor of the President's renomination. In fact, so prevailing was the sentiment in the Committee in regard to his candidacy, that the last shadow of the Hill boom faded away on the spot. It is generally believed now that a solid Cleveland delegation will be sent from this State to the National Democratic Convention, and that his unanimous renomination will follow as a matter of course.

All the politicians of the local Democratic organizations appear to be warmly in favor of the President. Tammany and County Democracy leaders vie with one another in their vows of allegiance to him, and in their predictions of the enormous majority which a united Democracy will roll up for him in this city in November. "Paddy" Divver goes on the record with the prediction that the majority will be a "cold one of 70,000." Others are less sanguine, but it is very evident that the party has an unshakable belief in its ability to poll a sufficiently large vote in this city and Brooklyn to overcome by many thousands any Republican majority which can be polled in the other parts of the State. There can be no question that there is a strong basis for this belief. It is many years since the local Democrats have been so thoroughly harmonious as they are at present. In 1874, when they were thoroughly united in support of Tilden for Governor, they had a plurality of nearly 43,000. When they supported him unitedly for President two years later, they increased this plurality to nearly 54,000. They split in 1879, when John Kelly ran for Governor against Robinson. Tammany then gave the former 43,000 votes, and Robinson polled 60,000, having a plurality in the city of 14,000. During Kelly's career as boss, the Tammany strength remained pretty steadily at about 40,000. Both factions united with more or less heartiness in support of Hancock, and gave him a plurality of 41,000. When Cleveland ran for Governor in 1882, they were also united, and gave him a plurality of 77,000, but their total vote was only a shade larger than it had been for Hancock. The difference in plurality was caused by the drop of the Republican vote for Folger, which was nearly 34,000 less than Garfield received.

John Kelly's quarrel with Cleveland, which began soon after the accession of the latter to the Governorship, was at white heat when the Presidential campaign of 1884 opened. No competent person can examine the district returns of votes cast in this city for Blaine and Cleveland that year, and not reach the conclusion that the larger part of Tammany's 40,000 votes went directly to Blaine. As a consequence, the Democratic plurality in the city went down to 43,000. Union upon Hill in the following year carried it only to 48,000, there being still a split on local and county nominees. In 1886 the Labor party put in its appearance, and drew from the Democrats probably 40,000 of the 68,000 votes which it polled, reducing the Democratic plurality to 22,000. Last year the Labor vote dropped to 37,000, and the Democratic plurality rose to a higher point than it had touched for several years, 52,000. That was cast for the State ticket. On the local ticket, Col. Fellows's unsavory candidacy commanded only 22,000 plurality.

That there is formidable strength in a united and harmonious Democracy in this city no one can deny. As between two such candidates as Cleveland and Blaine, without the treachery practised by Kelly in 1884, it is not at all rash to suppose that a plurality might be rolled up which would approach very nearly to Divver's sanguine figures. There is no danger whatever of such treachery apparent now, and there is another important change in the local situation, which has happened during the past year, that will also greatly help the Democrats. We refer to the disintegration which has taken place in the Republican Machine. That organization is the mere shadow of what it was four years ago, and while a large fund might restore some of its former vigor, there is little chance that it can do anything like such service in keeping down the Democratic majority as it did then.

There is ground, therefore, for the high Democratic hopes of a large majority here, but there is another side to the picture which it will be wise to consider. There can be no disguise of the fact that the warmth with which all the most objectionable elements of the Democratic party are supporting the President gives a good many of his non-partisan friends unpleasant emotions. Especially is this the case when the facts about the civil-service-reform work of the Administration are considered. Strong as the united Democratic organizations in New York are, they are not invincible. They have failed more than once to carry the State without the aid of independent voters, and they may fail again. It would be a grave mistake for the President or any other candidate to base his hopes entirely upon their support. With an objectionable Republican candidate like Blaine in the field, there might be little risk, but with a candidate on that side in whom the independent voters had confidence, Divver's 70,000 plurality would suffer a dangerous shrinkage.

HEWING TO THE CENTRE.

Nothing that the Republican majority in the Senate has recently done deserves so much praise as the appointment of a committee to investigate the condition of the civil service. There have been inquiries in this field before now, notably in Indiana and Maryland, but they have been conducted by volunteers, like the civil-service-reform associations, which had no power to compel the attendance of witnesses or the production of papers and documents, and whose reports, therefore, might be safely disregarded, or even pooh-poohed. This time we have a tribunal before which witnesses must appear, and by which the facts can be brought out; and no matter how much bias it may put into its report, the public will form its judgment on the testimony. The inquiry, too, has been very properly begun in the Philadelphia Post-office, where, unless rumor has been more than usually untrustworthy, the disregard of the President's promises and professions with regard to the tenure of office has been, ever since the present Postmaster came into office, flagrant, persistent, and audacious. The testimony already produced there is very damaging, but we will not comment on it, because it is thus far *ex parte*. It is the testimony for the most part of employees dismissed without notice or cause assigned, and, as we all know, there is generally another side to the stories which such witnesses tell.

But we are not inclined to incredulity in this case, because it is not a solitary case. We know as well as we can know anything which has not been proved to demonstration, that the abuses which exist in the Philadelphia Post-office also flourish in many other places, and that all attempts to get them checked or even investigated by the Administration have failed; and not only this, but that the spoilsmen have in every direction become increasingly bold and reckless as the time draws near when President Cleveland is likely to ask the American people to pass a judgment on the manner in which he has fulfilled the solemn pledges of his party platform, of his letter of acceptance, and of his inaugural address. All the efforts of those who supported him simply as a reformer in 1884 to procure inquiry or redress either as regards the Post-office, or Land Office, or Indian Bureau, have thus far been unsuccessful, and yet in all these spheres the scandals have been numerous, have increased as time has gone on, are, to the best of our knowledge and belief, worse now than they have been at any time since 1884, and have become so in the face of this most solemn declaration made by the President in front of the Capitol on the 4th of March, 1885:

> "The people demand reform in the administration of the Government and the application of business principles to public affairs. As a means to this end, civil-service reform should be in good faith enforced. Our citizens have the right to protection from the incompetency of public employees, who hold their places solely as the reward of partisan service, and from the corrupting influence of those who promise, and the vicious methods of those who expect, such rewards. And those who worthily seek public employment have the right to insist that merit and competency shall be recognized instead of party subserviency or the surrender of honest political belief."

At this moment pressure of the most extraordinary kind is being brought to bear on the Custom-house in this city, by Assistant-Secretary Maynard, to compel the offi-

cers to do things which he well knows would violate the President's pledges, degrade the public service, and debauch the party in power. Remonstrance and entreaty have done all they can do, which is simply nothing, to arrest this downward progress.

We are therefore glad we are now going to have official investigation, and that the conduct of it is in hostile hands. The evil is too deep-seated to be fully laid bare by a friendly knife. We trust the Committee will take the New York Custom-house on their way, and hew to the centre here also, no matter where the chips fly. That the Republicans should think they can damage their opponents by inquiring how far the service of the Government has been used for partisan purposes, is surely a most encouraging sign of the times. Five years ago Senator Hale himself would have considered the appointment of a committee for any such purpose a most ridiculous thing, and would probably have asked with amusement why the civil service should not be used for partisan purposes. We have made wonderful advances since then, and we shall see now whether we cannot make Democratic politicians of their very vices "frame a ladder," as the poet said, by treading

"Beneath their feet each deed of shame."

THE SUPPRESSED VOTE IN MASSACHUSETTS.

Republican organs at the North for a long time past have been saying a great deal about "the suppressed vote" at the South. Their custom is to take certain Congressional districts or States at the North in which both parties are thoroughly organized and bring out their full strength at every election, and contrast their large votes with the small totals in certain Congressional districts or States at the South, where the Republican organization has gone to pieces since it lost the Federal offices, and where consequently not even the Democrats need to turn out in large numbers in order to carry the day. The difference between these totals is treated as "the suppressed vote," and it is held that the representation in Congress and in the Electoral College of such Southern States ought to be cut down, in order to establish an equality in suffrage between the North and the South.

Turn about is fair play, and it is time to point out that if a small vote means a suppressed vote, and ought to be punished by a reduction of representation, the North also must suffer. Every candid person will of course admit that if there is a Northern State with a small negro population in which men do not vote so generally as they do in a Southern State having a large negro population, "something ought to be done about it," to use the common expression of the Republican organs regarding the South. There is such a State, and circumstances render its case conspicuous.

The last census gave Massachusetts 1,783,085 people, of whom all but 19,303 were white. At the same time Florida had 269,493 people, of whom 126,888, or nearly one-half, were colored. The Congressional apportionment gives Florida two Congressmen, and Massachusetts twelve. At the last election for Congressmen in Florida there were cast 21,882 votes in the First District and 34,895 in the Second—a total of 56,777, or an average of 28,388 for each district. At the same election in Massachusetts the total vote cast in the First District was only 16,071, and in all twelve districts 245,304, or an average of but 20,442 for each district. In other words, while it took 34,895 votes to elect a Congressman in one district of Florida, 16,071, or less than one-half as many, sufficed to elect a Congressman in one district of Massachusetts; and while in the whole State of Florida it took an average of 28,388 to elect a Congressman, it required an average of only 20,442 votes to elect a Congressman in Massachusetts.

The injustice of the matter appears more clearly the further the examination is carried. Take, for instance, Duval County in Florida, which has a decided preponderance of negroes in its total population of 19,430. At the election of 1886 Duval County cast 4,910 votes. Take, now, Barnstable County in Massachusetts, which has only 420 negroes among its 31,797 people. It is obvious that the total vote of Barnstable County ought to bear the same proportion to the total vote of Duval County that their respective populations bear to each other; or, stated according to the rule of three, 19,430 : 31,797 :: 4,910 : 8,035. But in point of fact only 2,713 votes were cast in Barnstable County, or but a trifle more than one-third of the number which ought to have been cast. It is clear that nearly two-thirds of the vote of Barnstable County was suppressed, but the full enormity of the offence does not appear until one reflects that by this suppression every man who does vote in the Massachusetts county really exercises three times as much power at the polls as every man who votes in the Florida county. The disparity is not so great, taking the whole of each State, but still it is serious enough to demand remedy. It has been shown that it takes on the average 28,388 votes to elect a Congressman in Florida, and of course it ought to take at least as many on the average to elect a Congressman in Massachusetts. But in point of fact the suppressed vote in Massachusetts was so large that an average of only 20,442 votes elected a Congressman. The result is that a total vote in Massachusetts of only 245,304 elected twelve Congressmen, whereas the Florida ratio entitles the State to only nine. In other words, through the suppression of votes Massachusetts gets three Congressmen to whom she has no right if held to the standard of Florida.

Nor is the question one which concerns Florida and Massachusetts alone. The whole country is interested. The representation of a State in the Electoral College equals the number of its Senators and Representatives combined; that is, Florida has four electoral votes and Massachusetts fourteen. But if the suppressed vote in Massachusetts is so large that she is entitled to only nine representatives in Congress, she ought to have only eleven votes in the Electoral College. This is a matter that concerns not merely the negroes of Florida, who are defrauded of their just rights by the white men of Massachusetts, but the whole nation as well. It is a gross outrage that Massachusetts should have fourteen votes in the election of a President when she is really entitled to only eleven. "Something ought to be done about it," and we feel sure that it is only necessary to bring the subject to the attention of Mr. George F. Hoar to secure an immediate cutting down to its just limits of the unfair power which Massachusetts now wields in Congress and in the Electoral College.

BUSINESS SUCCESS AND FAILURE.

Mr. Joseph H. Walker of Worcester, Mass., recently delivered a "practical talk" before the Young Men's Christian Association of that city, which, although entirely local in its subject, contained a great deal of matter that is of general interest. Mr. Walker is an old resident of Worcester, and he gave a condensed narrative of his observations among the business men of the place, the special value of which consisted in the statistics that he had compiled, covering a period of nearly half a century. As Worcester is an old city in a long-settled State, the fluctuations of business are naturally less than in the new cities of the younger States at the West, and a study of the fortunes of business men in such a place therefore shows the normal tendency of things in a conservative and prosperous community.

Mr. Walker began by citing facts which show how brief is the average duration of business enterprises. He picked out 56 of the more prominent men of 1845, and found that one-fifth of them were out of business within five years, two-fifths in ten years, and three-fifths in fifteen years. These, however, were a selected set, who undoubtedly make a more favorable showing than would the whole class, and Mr. Walker thinks that of every hundred men in business in 1845, 25 were out in five years, 50 in ten years, and 67 in fifteen years.

Most of these disappearances mean simply failures. Mr. Walker has traced the history of individuals engaged in the leading manufacturing industries of Worcester since 1840. Of those so engaged in that year he finds that 14 failed, and 14 died or retired with property. Of the same class in 1850, 41 failed, and 30 died or retired with property. Of the 1860 class, 43 failed, and 60 died or retired with property. These were, as before, the picked men among the manufacturers—those who conducted their business under exceptionally favorable circumstances—and the showing is undoubtedly far more favorable than it would be for business men of all sorts, doing business on a scale large or small. Accurate statistics for the whole class are nowhere accessible, but there has long been an agreement among competent judges in all parts of the country that 90 per cent. of all men who try to do business on their own account fail of success, while some put the proportion as high as 95 per cent. Mr. Walker's discovery that this

is true of half or more of the favored number whose careers he has traced, sustains the theory that fully nine-tenths of all fail.

That wealth does not, as a rule, long remain in the families of those who acquire it, is clearly shown by Mr. Walker's investigations. There were 30 prominent manufacturers in 1840—the "capitalists" of that day—of whom 14 either died or retired with property, but only 3 of the sons of the 30 now have any property or died leaving any. There were 75 manufacturers in 1850, of whom 30 either died or retired with property, but only 6 of the sons of the 75 now have any property or died leaving any. There were 107 manufacturers in 1860, of whom 60 died or retired with property, but only 8 of the sons of the 107 now have any property or died leaving any.

It naturally follows that the business men of the present generation in Worcester include but a very small number of men who are sons of the business men of a generation ago. In 1878 there were 176 individuals engaged in 10 of the leading manufacturing industries, and only 15 of these 176 were themselves sons of manufacturers. The proportion proved to be almost the same during the early portion of the period, but the fact was not so striking or significant when so many branches of manufacturing industry were new as it is now.

It is a corollary of this that the business men of to-day are the poor workingmen of a few years ago, who have pushed themselves to the front by their energy and industry. It will surprise nobody to learn that, of the 30 manufacturers of 1840, 28 began as journeymen. But it will surprise many people, who have been told that the poor man no longer has a chance, to find that the proportion was quite as great a generation later, no less than 161 of the 176 manufacturers of 1878 having begun as journeymen. Nearly half of them went into Worcester from farms, and most of the rest were the sons of machinists, carpenters, blacksmiths, etc.

It is much to be wished that the labor agitators, from Henry George down, would study and digest such figures as these, and then tell the workingmen what they signify. The labor agitator is constantly talking about the "bloated capitalists," and cultivating the idea among workingmen that employers constitute a caste of wealth. The truth is, that 90 or 95 per cent. of all capitalists—that is, men who carry on business upon their own account—fail; a large proportion of them after a long and melancholy struggle to keep their heads above water and pay the wages of the men whom they employ, and who never suffer one-tenth the frequent anxiety of the employer, wondering all the week where he is going to get the money to pay them Saturday night. The labor agitator—even so intelligent a man as Henry George—is constantly talking about the impossibility of the workingman's forcing his way among the capitalists. The truth is, that the capitalists of to-day are themselves the workingmen of twenty-five years ago, as the workingmen of to-day will be the capitalists of twenty-five years hence.

MR. ARNOLD'S DISCOMFORT.

Mr. Matthew Arnold's article on "Civilization in the United States," as it appeared in the last number of the *Nineteenth Century*, Mr. Smalley, the London correspondent of the *Tribune*, introduced to the American public on Sunday week with a somewhat amusing wail of mingled sorrow and indignation. The subject as Mr. Arnold gives it out, "Civilization in the United States," or, as he explains it, "the success of the Americans in solving the human problem," is really a tremendous one, which one would hardly expect a man of Mr. Arnold's intellectual experience to attack in sixteen pages of a monthly review. If we might be allowed to amend the title, we should call the article, "Why I Was Uncomfortable in the United States." We are all the better pleased with this suggestion because he gives as his reason for writing, or rather as an incentive to writing, the article, the fact that Sir Lepel Griffin, "a very acute and distinguished Indian official," had also published the opinion "that there is no country calling itself civilized where one would not rather live than in America, except Russia," meaning by "one," of course, Sir Lepel himself.

This deliverance seems to have made such an impression on Mr. Arnold that he resolved to do now what he had thought of postponing—make an inquiry into the nature and defects of American civilization. And yet, a little further on, he reveals the fact that he saw very clearly what the cause of Sir Lepel's dissatisfaction with the civilization of the United States was. It was neither more nor less than the absence of those "comforts and conveniences of life" which "men of the professional and official class in England, who do the most part of her literature and journalism," have provided for them in England at very small expense, or, in other words, at prices suited to incomes of "from four to fifteen hundred [pounds] a year," and which in America can only be had by the very rich—such as clubs, hansom cabs, porters at railway stations, tailors, and mercers. When a man of Sir Lepel Griffin's class, Mr. Arnold naïvely adds, "is passing judgment on a country's civilization, points of this kind crowd to his memory and determine his sentence." So that really what Sir Lepel ought to have called his book was also, "Why I was Uncomfortable in America."

Nothing, however, but a lack of humor ever allows a man to present his own discomforts as a traveller to the world as his "judgment on a country's civilization." The judgment of a man who takes himself so seriously as this is, in fact, of little or no value on any subject but his special work. No one with a real capacity for generalization or a real sense of proportion would have ventured to lay Sir Lepel's book before the world as a contribution to political or social philosophy. That Mr. Arnold should have taken it as such, and charged himself with the duty of prosecuting the inquiry on which Sir Lepel entered, shows, we fear, that same deficiency of the humorous faculty which led "the acute and distinguished Indian official" to print with much solemnity conclusions about American civilization drawn from the expensiveness of its clothes, clubs, and cabs.

We are far from denying, however, that such books as Sir Lepel Griffin's and such articles as Mr. Arnold's are interesting and instructive. Every sensible man likes to hear how a distinguished Indian official, or an Englishman of the professional class and official class, who "has been at the public schools and universities," if he writes or talks reasonably well, finds life and manners in this or any other country, and to hear him tell what he enjoyed or admired, what offended his taste or excited his reprobation; but he must do it without solemnity. He must not sell figs in the name of the Prophet. That Sir Lepel Griffin would not like to live in the United States is a fact; but it is not a great or pregnant fact. To get any sociological nutriment whatever out of it, one has to know Sir Lepel Griffin, for he may be a man who not only would be uncomfortable in the United States or in Russia, but is uncomfortable wherever he goes. We have known Anglo-Indian officials who never could be happy even in England.

Everybody who is in the habit of looking at Mr. Arnold as a social and political philosopher, as well as a brilliant literary critic, will regret that he should have attempted an examination of American civilization in a short article on the Griffin plan. He was, like Griffin, uncomfortable in the United States. The sources of his discomfort, it is true, were different from Griffin's, and for the most part more serious; but we really must not be asked in this brief and peremptory way to pronounce American civilization a failure because Mr. Arnold did not like the American landscape, or the climate, or the restlessness of the farmers, or the plainness of the cities, or the absence of "cathedrals, parish churches, and castles of the Catholic or feudal age," or the odious names of the new Western towns, or the absence of "distinction" among the men. It is, perhaps, unfortunate that such things should be, but a real philosopher does not make too much of them, or produce them with too much preface. Mr. Arnold's well-known picture of English society—"an upper class materialized, a middle class vulgarized, and a lower class brutalized"—shows under what extremely unfavorable social conditions a country may be great and happy and highly civilized. A foreign philosopher visiting England and witnessing the condition of these classes of the population as described by Mr. Arnold, might well feel justified in taking an extremely gloomy view of England as a place of residence for men of intellectual tastes, and yet we know that tens of thousands of them find great comfort in that island, and would not quit it though the cab fares and the tailors' bills went up 100 per cent.

Mr. Arnold, too, is very much troubled by the want of native criticism of American defects. He says there are "plenty of cultivated, judicious, and delightful individuals" here,

but they all keep silent about the national faults. Supposing this to be true, in the broad way in which Mr. Arnold states it, is this not also a defect to which a foreigner, and especially an Englishman, should be very indulgent? We do not think it is true as Mr. Arnold states it. There is a great deal of criticism by Americans of American morals and manners, but no native criticism ever satisfies a foreigner. He always wants it laid on stronger, and is displeased if it is tempered by any perception of countervailing virtues. The way the English press treats the conduct of Englishmen in dealing with other and especially weaker communities, for instance, is never what foreign critics think it ought to be. There are reserves and omissions and qualifications in it which make Americans and Frenchmen and Germans swear with indignation, and yet, in spite of it all, it is the general belief that English civilization improves. It is not every one, as human nature goes, who enjoys, as Mr. Arnold and Mr. Ruskin do, speaking their mind freely and incessantly to the people among whom they live about their faults and follies. Such men are doubtless a precious possession to any community, but they will always be scarce, and have to be amazingly clever not to become insufferable bores. There is probably not one of the thousand agencies of human culture which accomplishes so little as lectures from censorious sages.

Mr. Arnold's attack on the American press touches on what all foreigners of distinction find the greatest mystery and nuisance of American life. For the last fifty years the newspapers have been the first thing which attracts their attention when they land, and which during their stay here most distinctly represents to them the national taste and manners. "The absence of truth and soberness in them, the poverty in serious interest, the personality and sensation-mongering, are," he says, "beyond belief." This is undoubtedly what a very large body of the most intelligent and cultivated Americans say of the newspapers, and it is no wonder that a foreign critic, who suffered severely from their brutality when he was here, should say it also. But here again it does not do to generalize too sweepingly. It is not true of the American press as a whole, and when true of particular newspapers is almost always the result of the personal peculiarities of the editor. For reasons which we have not space to discuss here, journalism in the United States has until recently been one of the neglected callings, which made no serious drafts on the talents and cultivation of the country, and of which the pecuniary possibilities were first made plain by a man of very low character. He may be said to have created "the American newspaper" as the world knows it, and to have given it a stamp and tone from which it has not yet worked free; but to conclude that it will never become more sober-minded, more serious in its interests, and more careful about accuracy, and more closely allied to the intellectual life of the country, is to deny one of the plainest facts of American history, and that is, that there is no department of human activity in which progress in the United States is not constant and steady, though at particular points not always very perceptible.

> "For while the tired waves, vainly breaking,
> Seem here no painful inch to gain,
> Far back, through creeks and inlets making,
> Comes silent, flooding in, the main."

PARLIAMENT TILL EASTER.

LONDON, March 29, 1888.

THE Easter holidays have come, and the Government may look with complacency on the record of the last six weeks. The Conversion Bill has already been passed into an act, with an assured prospect of success for the great financial operation which is its object. The Local Government Bill, a measure of the first magnitude and importance, has made an unusually fair start, and, though the signs of reviving trade are still faint and uncertain, the Government have been able to come to Parliament with a budget showing a larger surplus than the Chancellor of the Exchequer has had at his disposal for a good many years. The position of all these measures is favorable, after making every allowance for the defects they contain and the dangers they may run.

The credit of the financial proposals, so far as they are ultimately successful, will belong, of course, to Mr. Goschen. Those who doubt the correctness of his published opinions as to the effect of the appreciation of gold upon trade and prices, may not regard him as a trustworthy guide in the more difficult problems of political economy; but all the world was prepared to find in him a capable Chancellor of the Exchequer. His name, moreover, may be justly associated with the reform of local government also, because, when he was the first President of the Local Government Board, created in 1871, he did much to elucidate the principles on which reform should proceed, and reform in this direction has ever since been a definite aim of the party to which he then belonged. I believe the Liberals as a body recognize with pleasure that the finances are in the hands of an able man who knows his business, and whose administrative powers were too long lost to the country, even though on most political questions they find in him, to say the least, a very determined opponent.

Whatever interest may attach to the measures I have mentioned, they have not, in the eyes of many critics, redeemed the session up to the present time from the imputation of dulness. To this charge I cannot subscribe. It is true that, with the exception of one or two nights during the debate on the address, there have been no heated and angry discussions. But this very change in the temper of the House is a matter of great importance and of good augury—I wish one could dare to assume that it will be permanent; and there are certain other aspects in which the proceedings of Parliament have been specially significant and interesting. The new Procedure Rules have hitherto been a great success. The two important rules are the Closure Rule which was passed last year, and the suspension of business at midnight. It is by the combination of these two rules that the improvement has been effected. The midnight rule presses somewhat hardly on private members' bills, which often found their only chance in the small hours of the morning. But if the difficult problem could be solved of making some selection among these bills, which are now left to a most unsatisfactory system of ballot, more would be gained than has been lost by the new rule. The prudence of making the discussion of the new rules the first business of the session was questioned by the Opposition leaders, though they undertook that, so far as their authority extended, no factious opposition should be offered; but the event has justified the Government. The House was more generally eager than was counted upon to adopt reasonable hours. The rules now furnish very formidable and effective weapons against obstruction, but hitherto there is ground for the better hope that all sections of the House will concur in turning over a new leaf.

One test of the complete success of the rules will be when the closure is not regarded as penal, but an ordinary incident of procedure; and though an amendment to make it automatic met with little support, there is certainly an approach to this change of view on the subject. Another incidental improvement which must follow, if the rules are to work well, is a curtailment of the length of speeches. On this subject there was some plain speaking. A few speakers on the front bench and elsewhere have had too great a monopoly of the time of the House, and have not made a moderate use of it. The House is very patient of a speaker who by any means has once got its ear, and speakers have not realized how inexpressibly tedious their long and ill-digested harangues had become. In this respect there is a beginning of improvement. A very high authority is said to have been struck by the greater condensation of speeches in some recent debates. Then the withdrawal of the hours after midnight has improved the temper of the House, because it was generally after midnight that it lost its temper.

But the most remarkable feature of the proceedings of the present session is the advance which they disclose in the growth of liberal opinions. At the opening of the session, in 1880, Mr. Gladstone's Government, in the flush of victory, was embarrassed for weeks by the opposition offered to Mr. Bradlaugh's taking his seat. The other day, with a Tory Government in office, Mr. Bradlaugh carried the second reading of his Oaths Bill by a majority of 100. The question of the reform of the House of Lords has entered into a new phase. For the first time the regular Opposition in the House of Commons has declared it is now ripe for consideration, and the debate and division on Lord Rosebery's motion show how seriously the matter is now taken up by the House of Lords itself. Lord Salisbury, echoed by the Unionist organs in the press, says that the House of Commons will not tolerate any reform of the House of Lords which will make it a stronger power in the country—which is tantamount to saying that it will not tolerate any reform at all. These critics profess to know the mind of the House of Commons better than its own members. The majority of the present House, by their recent vote, declared their opposition to reform of the House of Lords. But the number who objected to reform on Lord Salisbury's ground is infinitesimally small. Any one who supposes that such a consideration is sufficient to secure acquiescence in the present constitution of the House of Lords, is blind to the signs of the times, the signs of the present session. The argument, if good for anything, is an argument for a single chamber. But to such a change, without discussing its merits, the public mind would, at least for the present, be averse. If any change is made within a reasonable time, and that is probable,

it will be a reform of the present second chamber, and one question will be how far the hereditary element is to be retained. Some very moderate Liberals think it would be illogical to leave any vestige of a principle which is so indefensible in theory and so incongruous with present democratic institutions. I am inclined to think it more probable (always assuming that reform comes in time) that the hereditary principle will be practically retained in defiance of logic, and that it may lie embalmed in the swept and garnished House for many a long year. If I am not mistaken, Mr. Gladstone pleaded for the hereditary principle in his address to the electors of Midlothian in 1885, as a more respectable kind of privilege, and to a certain extent a counterpoise to the ascendency of mere wealth. The sentiment of the people has still some favor for an hereditary aristocracy, and I doubt whether the democracy are bent upon extinguishing it entirely in the Legislature.

But the great landmark of Liberal progress is the Local Government Bill. The reform of municipal government and the establishment of the representative principle in towns was one of the great Liberal achievements which were made possible by the Reform Act of 1832. The Liberal party has long contended for the application of the same principle to counties, to local government outside of towns, and now it is adopted without reserve by a Conservative Government, and even extended to the government of London, the reform of which has long been the dream of Liberal reformers. Some of the important practical results which may be expected from the acceptance of the principle, such as the reform of poor-law, school, and liquor-licensing administration, are not carried out or are imperfectly carried out in the bill. But the principle is there, and even the means of extending its application are provided. It is described on both sides of the House as a thoroughly radical bill. It is incontestable—I do not think that any one would deny it—that the same bill, if proposed by a Liberal Government, would have met with the most strenuous opposition from the united Conservative party. Now, only a few faint murmurs are heard in the clubs and in the press. The Government has made resistance more difficult by handing over several millions to the local authorities from the imperial taxes, and by mixing up the budget with the bill, so that they must stand or fall together. But such precautions were, perhaps, not essential. They counted with justice on the docility of the party when a choice was to be made between power and principle. The tone of remonstrance rises no higher than an article in an evening paper which condemns the bill as thoroughly radical and thoroughly bad: strong measures are necessary in the crisis; Conservative principles are at stake. But the remedy suggested is not to vote against the bill, but to walk out.

The reflection occurs that, if the Tories pass radical measures, it may indefinitely retard the return of the Liberals to power. It may—the Liberals are well aware of it; but they will help forward the bill by every means in their power. They are accustomed to the situation. They know that most of the great reforms of the century have been carried under similar conditions. They make a virtue of necessity. The virtue is learned from necessity, but it is virtue after all, and contrasts favorably with the pliancy of opponents, the bulk of whom do not pretend that their convictions have changed.

Meanwhile, the Ministry say to themselves, Ireland will be forgotten. The Liberals say, No; real reform in England will make the misgovernment of Ireland more palpable and more intolerable to the conscience of Englishmen.

C. D.

THE POPE AND HOME RULE.

ROME, March 20.

THE relations of the Pope to the home-rule movement have been the object of so much report, in such variation of color, that I am tempted to give you an account of what is known to have been done and said, and what is the most authoritative opinion in Rome about it. In the first place, the general, and apparently almost ineradicable, belief that the Duke of Norfolk had a mission to induce the Pope to exercise some influence on the clergy of Ireland against home rule, has no foundation whatever. The Duke came here as the head of the special mission to thank the Pope for his mission of felicitation on the occasion of the Queen's jubilee, and to deliver the presents which were the reciprocation of those sent to the Queen; and when he had finished the ceremonial involved in these two acts, he returned with his staff to England. In the performance of this duty, not one word was said of a diplomatic or political nature indirectly or directly relating to the Irish question. This I am able to say on authority which cannot be contested, that of the Duke himself, and that of every member of his mission, all of whom I saw during the stay of the special mission continually, confirmed by the testimony of Catholics who were in a position to know what had passed.

When the Duke had returned to England and rendered account of his official relations, he went back to Rome at the head of the English Catholic pilgrimage, he being the chief of the Catholic nobility and gentry of the kingdom, but with no mission, secret or otherwise, from, or relation with, the English Government; nor did he ever enter into any negotiations on the subject of the Irish question with the officials of the Vatican. All reports and rumors to the contrary are without any foundation in fact. To any one who knows the Duke it is only necessary to know that this is his statement, and as he has in various forms and on different occasions distinctly declared to me that he not only had no mission of any character beyond that of the jubilee ceremonial, but had no knowledge of any mission of a political character, there is no justification for the persistence in maintaining that the Duke has either failed in his mission, or is about to return to England to report on the results of it; or in attaching to his stay or departure any political importance. The Duke is not by nature a politician or a diplomat, but a shrewd, common-sense English gentleman, a devoted Catholic, and a most loyal supporter of the Crown and the present Government. To these qualifications and that of being the hereditary representative of English Catholicism, he owes his being appointed as the head of the special embassy for the jubilee; and beyond this there is nothing.

But there is more than this to be said. The English Government is not in a position to enter into negotiation with the Pope on the question of Ireland, or to ask for any assistance from the Vatican in the arrangement of the Irish complication, for the simple reason that if concessions are asked others must be made, and there is nothing that the Government could concede in return. The Catholics are, after a period of bigotry and intolerance on the part of English public opinion quite as bad as that complained of now in Spain, placed on a footing of absolute equality, as far as depends on the law, with Protestants; and beyond this no government can go; and that this is realized by the Pope is shown by his reply to the address of the English deputation, in which he referred with special unction to the complete liberty which the Church enjoyed in England.

To obtain for Ireland privileges for the Church which it has not in England, would be too evidently chimerical for the shrewd Vatican negotiators to put such a proposition forward, as they can see (with no exceptional knowledge of English affairs) that such a concession would be disastrous to any government making it, and would be untenable; and the Church never commits the folly of making idle demands. In a Protestant country, all that the Church can hope for is perfect equality, and nobody knows this better than the Pope's advisers. The only thing that the English Government could do to gratify the Pope would be the establishment of diplomatic intercourse with the Vatican, and this is clearly seen by the Church authorities here to be impossible at present, not on account of the indisposition of the Government itself, but from the popular superstition that the Church is still intent on the overthrow of the present dynasty and the restoration of—what, it is difficult to conjecture; and the popular belief that the entire body of English Catholics are in a conspiracy to change the Government, or, as it is expressed, "They are Catholics first and Englishmen afterwards." The English Catholics are so well aware of this that they would unanimously warn the Pope against making such a demand as useless, though they know that the attainment of it would be the highest gratification to him.

Moreover, the confession of weakness on the part of the English Government in asking for outside assistance to regulate its internal difficulties would be as disastrous as the breaking down of the present policy, because it would make a foreign potentate the master of the position. Then, although the Government of Mr. Gladstone made an attempt to arrange a *quasi*-diplomatic relation with the Vatican, it is certain that a similar attempt now would be used against the present Government by the Liberals, and might lead to the overthrow of the Ministry. These are the intrinsic difficulties in negotiation with the Vatican on the Irish question. The English Government has neither entered into nor attempted to establish negotiations with the Pope on the basis of "Do ut des" with regard to the submission of Ireland, nor, so far as can be known, or is known by the supposed negotiators, *on any other political matter* since the regulation of the Goa question more than a year ago. It has (and in my opinion most wisely) left the entire problem to the deliberations of the Pope and his advisers, and with results which are entirely satisfactory, if I am accurately informed, and which, if not everything that the English Government could desire, are all that it could hope for.

The declarations, made in the most impressive and pointed manner by the Pope on occasion of the reception of the Irish delegation, are unequivocal in their condemnation of the manner in which the agitation in Ireland has been conducted; and when we confront them with the usual reticence of Papal declarations under similar circumstances, they will be seen to be very significant. The Pope said, after expressing his affection for Ireland:

"To this feeling of affection we have recently given abundant expression in sending our venerable brother the Archbishop of Damietta, with certain instructions bearing upon the present state of affairs; that we may be aided

by his report in ascertaining the actual condition of things and the steps which, in your interest, it may be desirable to take. But in the difficulties that beset you, let what is contained in the letters addressed by us some years ago to the Archbishop of Dublin be taken as a safe and sure rule of action. This is demanded of you not only by religion, which has been the chief glory of the Irish race, but also by the public good, inasmuch as in no circumstances could the interest of the commonwealth be promoted if justice, which is the foundation of order and of all good things, were transgressed."

The reference to the letters to the former Archbishop of Dublin is conclusive. The letter of January 3, 1881, says:

"At the same time we unhesitatingly declare that it is their duty to be carefully on their guard not to allow the fame of their sterling and hereditary probity to be lessened, and not to commit any rash act whereby they may seem to have cast aside the obedience due to their lawful rulers; and for this reason, whenever Ireland was greatly excited in guarding and defending her own interests, the Roman Pontiffs constantly endeavored by admonition and exhortation to allay the excited feelings, lest by a disregard of moderation justice might be violated, or the cause, however right in itself, might be forced by the influence of passions into the flame of sedition. . . . And a little later, in the month of November, we testified to some Irish Bishops who had come to visit the tombs of the Apostles, that we ardently desired every good gift for the people of Ireland; but we added that order should not be disturbed. This manner of thinking and acting is entirely conformable to the ordinances and laws of the Catholic Church, and we have no doubt that it will conduce to the interests of Ireland. For we have confidence in the justice of the men who are placed at the head of the State, and who certainly for the most part have great practical experience, combined with prudence in civil affairs. Ireland may obtain what she wants much more safely and readily if only she adopts a course which the laws allow, and avoids giving cause of offence."

The scarcely veiled desire of the Pope in this matter is to be seen in his reference to the German difficulty. "Recently," he said to the Irish deputation, "as is known to you, the Catholics of Germany, acting with moderation and with regard for law, have, under our guidance, come safely out of a trying position. Why may not a like result through God's mercy be obtained in Ireland in a similar way?" Here the harmless ambition of the Pope appears in the desire to be invited to act as mediator between the English Crown and the Irish subjects as he had mediated in Germany—to be recognized as a prince of peace, and so finally to attain for the Papacy an authority in the political world as the great arbitrator between the nations, and a court of refuge from the quarrels which breed wars, and in this way to regain for the Pontificate a measure at least of the moral elevation which it enjoyed in the earlier ages of the Church.

W. J. Stillman.

Correspondence.

A REVIEWER'S ERRORS.

To the Editor of The Nation:

Sir: There are several errors in the unfriendly review of my book on the 'National Bank Act' which I desire to correct. The reviewer says: "A most important omission . . . is that of section 5242 of the United States Statutes," etc. The reviewer was very hasty in examining the book, for the section is given on page 191, followed by a review of all the cases and subsequent legislation relating to its construction.

Again, the reviewer says: "Much of the material has been derived from sources to which no credit is given." I have given credit for every statement which is not my own contained in the book.

The reviewer also says: "The impression apparently sought to be produced is, that the book is the result of a laborious exploration of an unknown field; that the cases and opinions cited have for the first time been gathered from the State and Federal reports, and from other original documents. . . . The ground he has covered, far from being an unknown field, had previously been investigated by many explorers." It is true that the reports of the Comptroller of the Currency and several other publications contain a digest of a considerable number of cases in which the National Bank Act has been construed. The last report of the Comptroller contains a digest of twenty-one pages, a fragment compared with my book. In preparing the book, the cases were collected from the national and United States digests, which contain all the cases, under conveniently arranged heads, reported from the beginning, in the State and Federal courts. To collect these required time, but was not difficult. The labor of collecting them from the digests was as easy as it would have been to collect them from the Comptrollers' reports or other sources, even had these been complete. Every case was then examined in the book containing the original report. The indisputable proof of this is, that the numerous quotations from the cases, and references to the exact places from which they are taken in the original reports, are not in any of the publications mentioned by the reviewer. Without disparaging the usefulness of the digests made by the Comptrollers (for they serve well enough the purposes for which they are especially made), or Mr. Ball's digest, these, for the most part, are simply the reporters' head-notes of cases either in their original or in an abridged form.

If the reviewer had been a practising lawyer and familiar with cases, he would have easily perceived from my treatment of them, and the giving of a much larger number relating to the construction of the act than can be found in any other publication on the subject, that I am not in the least indebted to the labors of other "explorers." Albert S. Bolles.

New York, April 9.

MR. FOULKE AND THE HALE SENATE COMMITTEE.

To the Editor of The Nation:

Sir: In your editorial of March 31 you refer to my testimony before the Hale Senate Committee as to the investigation made by me regarding the removals of postmasters upon secret charges, the results of which investigation were communicated to the President, and the system ascertained to have his approval.

You speak of my referring to the *Nation* in my testimony as follows: "That distinguished organ of Mugwumpery, for reasons unknown, had never published the facts." Such language from a witness, as you know, would be unbecoming and improper, and the quotation seems to be made with the object of attributing these words to me for that reason. I used no such language, and you have no right to put into my mouth, for the purpose of imputing any prejudice or unseemly conduct, the phraseology of a subsequent article in the New York *Tribune*, however proper that might be in the place in which it appeared. As you have misquoted me in your editorial, might I venture to hope that you will make the correction in a manner which will insure equal publicity?

You further say that the reason you did not publish the facts ascertained in the investigation was that you "had not complete confidence in the collector."

The original correspondence remained in my possession, and would have been at your service at any time, if you had desired me to send it, but no such request was made, nor did I hear from you in any form. If you doubted the accuracy of my report as to the statement made by President Cleveland, there could be but little difficulty in determining whether or not he approved of the system by his conduct after knowledge of these facts had been communicated to him.

As the results of these inquiries have not yet been laid before the readers of the *Nation*, may I hope that you will be willing to do so now if I send you the report, which you are at liberty to verify from the original correspondence, now in the hands of the Hale Senate Committee?

An early reply will greatly oblige,

Yours faithfully, Wm. D. Foulke.

April 7.

[We shall be glad to see the report and deal with it as may seem proper.—Ed. Nation.]

PENNSYLVANIA TAX LAW.

To the Editor of The Nation:

Sir: Will you allow me to correct a slight error in the article on "Recent American Legislation" in your issue of this date? You say (p. 276): "In Pennsylvania the mortgagee is *forbidden* to contract for the payment of taxes besides interest." The act of June 1, 1887 (Pamph. Laws, 292), to which you obviously refer, simply repeals the act of March 27, 1865 (Pamph. Laws, 57; 1 Purd. Dig., 928, pl. 8), which legalized the contract of *any borrower*, by mortgage or otherwise, to pay, in addition to the interest, the taxes assessed on the loan or its interest, so that the contract should not become usurious by the addition of the taxes. As the law now stands, a borrower can certainly contract to pay both interest and taxes, provided the two together do not amount to more than 6 per cent. per annum on the principal. Whether he can contract to pay the tax if the interest and tax together amount to more than 6 per cent., has never been decided, and it is fairly arguable that the tax, being in the end paid to the State by the lender, against whom it is assessed, is not such a payment to the lender as to be of the nature of interest at all, and that, therefore, such a contract would not be usurious.

Both laws, that of 1865 and that of 1887, the one seeking to favor the lender, the other the borrower, are, if they have any effect at all, nothing more than bungling attempts to adjust equitably that essentially inequitable thing, the taxation of personal property. C. C. B.

Philadelphia, April 5, 1888.

THE DENTAL TRUST.

To the Editor of The Nation:

Sir: The communication in the *Nation* of March 22, headed "A Dental Trust," is so full of misstatements as to call for correction.

Several years ago most of the manufacturers and dealers in dental supplies formed a trade association. This was long before the formation of modern "Sugar" and other trusts, and the association has nothing whatever in common with them. There has never been any

pooling of interests, nor any attempt to regulate the output of goods. Every manufacturer in it regulates his own prices, and manufactures as many goods as he can find a market for, without any reference whatever to the others.

The association has not "virtually succeeded" in crushing "every manufacturer that would not join them," and has not tried to do so. It has never bought and has never had any interest, direct or indirect, in any patent whatever. The individual members buy and use patents, if it suits them, without any reference to the association or to any of the other members of it. The association is simply a board of trade, holding a meeting once a year, and having a few common-sense business rules and regulations. The members are competitors in every sense of the word, as much as though no association existed. Such trade associations are common in other branches of business, and are considered beneficial rather than hurtful to the general interests of the community.

The principal dental journal of the world *is* owned by one of the members of this association. It is, however, absolutely untrue that it is conducted in the interest of any association. But even if this were true, there are besides it twenty dental periodicals published in this country, many of them not controlled by any manufacturer or dealer, so that it is an easy matter for a dentist to obtain a hearing, even if it were denied him by the "principal dental journal." If this matter is not of direct public interest, it is at least important that any statement published with regard to it should be correct. A MEMBER OF THE ASSOCIATION.

PHILADELPHIA, April 3, 1888.

ENTRANCE REQUIREMENTS IN WOMEN'S COLLEGES.

TO THE EDITOR OF THE NATION:

SIR: The writer who treats of the subject of entrance examinations in women's colleges in the *Nation* of March 29, draws a most alarming conclusion from premises which, as he states them, seem hardly adequate. In order to justify the plea with which the article closes, there should be at least a certified statement from the Presidents of Vassar, Smith, and Wellesley Colleges, to the effect that they had found the system of admission by certificate unsatisfactory in its results. We fancy some difficulty would have been experienced in obtaining these certificates. If the writer had taken the trouble to ascertain the views of the heads of these respective institutions on this subject, it might have appeared that the general experience was that students admitted by certificate sustained themselves as well as any other class.

There are many statements in the article that challenge criticism. It is assumed, for example, that principals of preparatory schools will be anxious to send their pupils to college before they are thoroughly prepared, and that colleges will be anxious to take them as soon as they can get them. Precisely the reverse of this is the case among both colleges and preparatory schools of a high order, with which class alone this discussion deals. The reputation of the preparatory school is at stake in the case of every student admitted on the principal's recommendation, and under such circumstances poorly prepared pupils are not likely to be recommended. Colleges are not anxious to increase the number of poorly prepared students. The certificate system does not increase the number of students in this way. When a student is ready to leave the seminary or high school, it is often a matter of very considerable uncertainty what is to be done next. Entrance examinations undoubtedly are a terror to very many even of those best prepared. When a student is thus halting between two opinions, the opportunity to enter college on certificate will in many cases turn the scale in favor of a college course, whereas otherwise the student would have decided to stop where he was. In this way the system of admission by certificate may operate to induce students to take a collegiate course who otherwise would be satisfied with the preliminary training.

Nor is it made clearly apparent why a system which is acknowledged to work well in connection with the State universities where both men and women are received, should work badly in colleges for women only. If such is the case, there should be some reason much deeper than any that are suggested. Michigan University counts its system of admission by certificate one of the most successful features of its administration. Recently Cornell has adopted the same system, with the following result: While 25 per cent. of the present Freshman Class were admitted by certificate, or nearly one hundred in all, only one student out of this number was dropped from the class at the end of the first term on account of inability to keep up with the class. This is the first year in which the system has been in full operation at Cornell, and the results have been far more satisfactory than was anticipated.

In reply to the statement that the weight of authority is against the system, Harvard, Yale, Princeton, Cornell, and Johns Hopkins being cited as proof, it may be admitted that the weight of tradition is against it, but we are growing unfamiliar with appeals to authority in such matters. Of the authorities cited, the only one that admits women, Cornell, has, as just stated, within the past year adopted the pernicious system; Johns Hopkins University is an institution which does not direct a very large part of its energies to its collegiate department, while Harvard, Yale, and Princeton are hardly the institutions to be referred to in discussing the higher education of women.

"Surely, it is not the function of college officers to travel about the country passing judgment upon preparatory schools." Nor is this necessary. Every student admitted to college from a given school gives the best sort of testimony as to the character of the work done in that school, and if students come uniformly well prepared, few mistakes are made in supposing that they come from good schools. As a matter of fact, if preparatory schools are not to be judged by college officers, who is to judge them? The argument from authority seems, with the above annotations, to stand as follows: The subject under discussion is the admission of students to women's colleges on certificates from approved high schools, academies, and private schools. All of the prominent women's colleges have adopted this system, and by continuing it have endorsed it. The leading coeducational State universities have adopted this system, and express their approval in no uncertain terms. The leading older colleges for men only have not adopted the system. Therefore, "It is time that those who have the true interests of the higher education of women at heart should utter a protest against this baneful system of admission by certificates, and ask that public opinion should demand a return to the honorable position held by Vassar ten years ago."

It may be on account of excessive mental obtuseness, but we really don't see the point.

C. H. T.

ITHACA, April 2, 1888.

TO THE EDITOR OF THE NATION:

SIR: Your issue of March 29 contains an article on the entrance requirements in women's colleges, in which are various statements and implications concerning the certificate system of Wellesley College. The author has apprehended the system somewhat less clearly than he would have done had he been able to travel the fifteen miles which lie between Wellesley and Boston, and obtain information from the proper source, instead of relying upon current report. No number of corrections can ever right the wrong done by careless or prejudiced statements. At the same time, it seems desirable that, in a matter so directly affecting the credit of the College, the truth should be made known.

A student who proposes to take a B.A. degree at Wellesley College, if she enters upon certificate, must present a formal statement that she has *within twelve months* (or, in the case of certain subjects, within fifteen months) passed satisfactory examinations in English, classics, mathematics, and a certain amount of history, geography, and physical geography. If she is to take a B.S., the requirements are the same, save that modern language is substituted for Greek. The examinations may, as your correspondent states, be based upon reviews. If the student has the knowledge which is to serve as the basis for her college work, we are not unwilling that it should have been in her possession for a considerable time.

The certificates are submitted to a board of examiners consisting of five professors, each of whom has special oversight over the subjects with which she is especially familiar. The paper having been approved, its owner is admitted with the distinct, printed statement that she is on probation, and will be allowed to remain only if her work during the fall term is satisfactory. During this term her classics, mathematics, English, ancient history, and ancient geography are tested, and as a result of such tests a small percentage of the class are advised not to return after the vacation. It is, no doubt, a delicate matter to send them away. But they are conscious that they have had a fair trial; they know that the work is beyond their present powers, and they realize the strain and the unhappiness of such a position. They rarely fail to admit both the justice and the wisdom of the decision.

Now as to the weight to be attached to certificates. The permission to offer them has been accorded in all cases only after most careful investigation. It is not, as your correspondent seems to believe, a matter of chance or favoritism. Since hundreds of students are turned away every year for want of room, it is no less our interest than our duty to scrutinize most keenly the proffered credentials, and to drop from our list relentlessly any teacher who shows either carelessness or incapacity in judging his pupils.

Finally, as to the advantages and disadvantages of the system. The original reasons for its adoption were two:

(1.) To draw together for mutual attrition women from the widest possible variety of surroundings, by relieving students from the expense and inconvenience of a long journey whose result was uncertain. In other words, it was intended as a substitute for a system of local examinations, which seemed undesirable. That it has been successful in this respect is shown by the fact that during the year 1886-87 the College contained representatives from thirty-one States and Territories, as well as from eight foreign countries.

(2.) To raise the standard of scholarship in

secondary schools, confessedly the weakest point in our entire educational system. So far as I know, statistics bearing on this matter have never been collected, but I am informed on excellent authority that the schools have responded to the stimulus by a steady improvement in the character of their work. Certain it is that the Freshmen admitted to Wellesley are better prepared each year than ever before.

Furthermore, experience has taught us that a girl who enters an examination room after a journey of considerable length (more than half our students come from beyond New England), oppressed by strange surroundings, the first onset of a homesickness that makes her almost wish to fail, and that mysterious awe of everything pertaining to a college which to many of us was once not altogether unfamiliar—that a girl who takes her examinations under such circumstances is far less likely to give a true expression of her attainments and mental calibre than if she took the same examinations at home in accustomed surroundings and free from distractions. Whether this is as true of boys as of girls, whether we should let it influence us or endeavor to control and overcome it, are not now the questions. In the existing state of things, "an examination at the college by the faculty" is not the justest way of testing a student's ability.

It is, perhaps, needless to add any distinct denial of the charge that we are influenced in the adoption of the system by pecuniary considerations. The amount of room at our command is so limited that nearly three-fourths of our applicants must be refused. Under these circumstances, to multiply applications is to multiply labor to no purpose, since an increase of receipts is impossible.

We claim, then, for our certificate system:

(1.) That it enables us to draw students from all parts of the country.

(2.) That it enables us to compare their abilities justly and with a minimum of friction.

(3.) That the standard of scholarship improves under it.

These claims we make not *a priori*, but as the result of eight years of experience with classes varying from 100 to 200, but never falling below the first number. M. A. W.

Wellesley College, April 5, 1888.

To the Editor of The Nation:

Sir: The matter of the admission of students to college on certificate invites a few remarks from the standpoint of the preparatory teacher. I believe that there are many teachers of preparatory schools, especially of high schools, who would be glad to see the whole system abolished. And they would have this feeling, not merely because of the annoyance to which they are now subjected, but because they find it very difficult, along with their other duties, to decide intelligently whether their students have satisfied the requirements, in all respects, of those colleges with whose conditions of admission they are not always familiar. The conditions prescribed at different colleges are in some respects so indefinite, and enforced with such varying degrees of strictness, that the conscientious teacher may well feel some hesitation in signing a certificate assuming *full* responsibility for his student's preparation in *all* respects. But the college-entrance examination is something of a bugbear to the high-school scholar, and when one school "enjoys" the "privilege" of sending its graduates without it, the teachers of other schools in the same section are in a certain sense compelled to secure for their graduates the same boon.

The high schools in Massachusetts are probably as well prepared to incur this responsibility as any in the country, but my own experience and observation convince me that the difficulties I have suggested above do not exaggerate the embarrassments which they often encounter.

Why should not the expedient of local examinations be extended, by the union of the collegiate institutions of New England and New York, which maintain substantially the same standard, in examinations of candidates for the Freshman classes, at central points, by committees representing all the institutions? Let separate certificates be issued for each department to those candidates who are successful, which shall be current, so to say, at all college-entrance examinations, and operate to excuse their holder at any time within one or two years from so much of the prescribed test as they represent, at whatever institution they are presented. If Harvard or any other college requires more in any department than the candidate holds certificates for, a suitable additional examination could be imposed.

In New England the public high schools have no organic connection with the colleges; the graduates of any given high school scatter among various colleges, and the present differing requirements for admission are, in a general way, a serious embarrassment in the preparation of scholars for college, and, in a special sense, a still more serious objection to the admission of scholars by certificate.

W. P. Beckwith, Supt. of Schools.

Adams, Mass., April 9, 1888.

Notes.

An American English version of the series "Les Grands Écrivains Français" has been undertaken, by international arrangement, by A. C. McClurg & Co., Chicago. The task of translating has been committed to Prof. Melville B. Anderson, for the initial volumes.

"The Great Cities of the Republic" series, begun by the Messrs. Putnam with 'The Story of New York,' by Mr. Chas. B. Todd, is to be continued with 'The Story of Washington,' by the same author, and 'The Story of Boston,' by Mr. Arthur Gilman.

'John Ward, Preacher,' is the title of a novel by Mrs. Deland (author of 'The Old Garden') announced by Houghton, Mifflin & Co.

'Life,' by Count Tolstoi, suppressed by the Russian censorship, will appear in an authorized translation from the press of T. Y. Crowell & Co.

Thomas Whittaker publishes directly the second part of Jennings's 'Manual of Church History,' and the fourth and concluding series of 'Expositions,' by Samuel Cox, D.D.

Cupples & Hurd, Boston, announce 'Stray Leaves from Newport,' by Mrs. Wm. Lamont Wheeler; and 'Social Life and Literature Fifty Years Ago.'

'Practical Statistics: the Statistician at Work,' by Chas. F. Pidgin, Chief Clerk of the Massachusetts Bureau of Statistics, is announced by the William E. Smythe Co., Boston.

The Filson Club of Louisville, Ky., have undertaken a series of biographies of leading pioneers in the settlement of that State. The first achieved is the 'Life and Times of Hon. Caleb Wallace, a Justice of the Kentucky Court of Appeals,' of which the author is Prof. Wm. H. Whitsitt of the Southern Baptist Theological Seminary. A limited edition will be printed, but will not be confined to members of the Club.

The American Copyright League will issue immediately for gratuitous distribution a pamphlet on 'Cheap Books and Good Books,' by Mr. Brander Matthews. It can be obtained in single numbers or in quantities on application to the Treasurer of the League, Mr. R. U. Johnson, 33 East Seventeenth Street, or to the Secretary, Mr. George Walton Green, 11 Pine Street.

Mr. William Archer's 'Anatomy of Acting,' concluded in the March number of *Longman's Magazine*, will be issued shortly as a book, thoroughly revised and greatly enlarged, in London and New York, by Longmans, Green & Co.

Macmillan & Co. announce a volume of poems by the Rev. Stopford A. Brooke.

Chapman & Hall are now publishing in London a popular edition of the complete works of Thomas Carlyle at a shilling a volume. The books of this collection are not mere stitched pamphlets, but are cloth-bound, seemly and shapely.

A work which promises to be of interest to American historical students is one on Peter Martyr, entitled, 'Un lettré italien à la cour d'Espagne: Pierre Martyr d'Anghiera, sa vie et ses œuvres. Par J. H. Mariejol' (Paris: Hachette).

The initial number of the *Journal of the United States Cavalry Association*, for March, has come to hand (New York: Brentanos). It is well printed at Leavenworth, Kansas, and is good reading.

New, too, is the *Rivista delle Biblioteche*, edited at Florence by Dr. Guido Biagi, librarian of the Marucelliana (Nos. 1–2, January-February, 1888). It may be compared, in its general aim to treat of library economy and bibliography, with our pioneer *Library Journal*. Both these periodicals appeal to the generality of cultivated and studious persons as well as to librarians. The first article in the *Rivista* is one on the loan of codices. Dr. Biagi follows with some remarks on examinations for librarians. The third paper relates to the law requiring deposits of copyrighted books in the designated national libraries. "German Libraries Judged by a German" is an abstract of Prof. Dziatzko's paper on "The Present State of Libraries and Librarianship in Germany," read before the British Library Association. Notable is Prof. Luigi Gentile's (unfinished) discourse on the much discussed age of the oldest MS. of the 'Divina Commedia,' the so-called Poggiali; and so is G. Fumagalli's account of rare editions of the Index Expurgatorius. Reviews of technical and scholarly works, and of periodicals, with news items, fill out this entertaining first issue.

A few more subscriptions will, we understand, warrant the revival of the *Rhode Island Historical Magazine*. They may be sent to Mr. R. H. Tilley, Newport.

The April number of the *New England Historic-Genealogical Register* will contain at the head of Mr. Henry F. Waters's "Gleanings in England" documentary evidence furnished him by Mr. E. H. W. Dunkin of the exact date and place of marriage of John Harvard to Anne Sadler, daughter of John Sadler, Vicar of Ringmer. This event took place on April 19, 1636, at South Malling, near Lewes, a parish adjacent to Ringmer. Facsimiles of the binding of John Harvard's brother Thomas to William Coxe, clothworker, and of his admission to the Clothworkers' Company of London, are annexed. The "Gleanings" proper throw much light on the relationships of colonial worthies—Wilsons, Taylors, and Ludlows.

The *Auk* for July opens with a brief but interesting account, by Frederick A. Lucas, of "The Bird Rocks of the Gulf of St. Law-

rence," in which the curious matter is the evidence of great changes in the forms and sizes of these islands since they were first described by Jacques Cartier.

The *Magazin für die Litteratur des In- und Auslandes*, having changed hands, beginning with April 1, will henceforth be published at Dresden instead of Leipzig.

Félix Buhot is the subject of the leading paper, by the editor, in *Le Livre* for March. M. Uzanne incorporates with his own appreciation of this "Illustrateur Aquafortiste" M. Philippe Burty's article in *Harper's Magazine* —of course in the original French. Numerous examples are given of Buhot's work, but the vignettes best show the strength and limitations of his powers. This number is rather rich in inedited letters of great men, derived from recent sales. One of Voltaire's, written at Cirey, October 9 [1778 ?], begins complacently: "Si Rousseau est mort, c'est un méchant homme de moins, et ses derniers ouvrages ne font pas plus regretter l'homme."

Petermann's Mitteilungen for March contains an account, by H. Rink, of Danish explorations in Greenland during 1887, and a review by the editor, Dr. A. Supan, of the recent report of H. Wild, Director of the Observatory at St. Petersburg, on the rainfall of the Russian Empire. Numerous tables are given, showing the results of observations at 445 stations, and six maps colored so as to designate the rainfall during the four seasons, as well as the total for the whole year and the number of days on which rain fell. The largest amount reported was at Sotche on the Black Sea, Poti being second. R. V. Eckert gives an entertaining sketch of the origin and wanderings of the Circassians.

Darwin's theory of subsidence as affecting coral reefs is criticised by H. B. Guppy in the March *Scottish Geographical Magazine*, from data obtained from observations in the Solomon Islands. The paper is illustrated by two maps, one being Mr. Darwin's original map showing the distribution of coral reefs, published in 1842, the other a map showing their distribution in 1888. This number also contains an account of Mr. H. O. Forbes's unsuccessful attempt to ascend Mt. Owen Stanley in New Guinea, and a paper by M. G. Mulhall on recent explorations in South America. He gives a list of railways in the Argentine Republic, in process of construction, or for which concessions have been granted, 7,455 miles in length, and to cost £57,580,000. Referring to the colonization of the country, he calls attention to the Chubut colony founded in 1863, which "now numbers 1,200 Welsh colonists, so orderly and industrious that the only crime committed there in twenty-four years was the murder of the Deputy Governor; he was killed by his own assistant, both being Argentines." Dr. Schweinfurth discusses the Welle problem, and Mr. A. S. White describes the partition of Central Africa among the European nations. Two maps, one showing the partition according to agreement, the other according to claims, accompany the article.

'The *New York Mirror* Annual and Directory of the Theatrical Profession for 1888,' edited by Harrison Grey Fiske, is welcome as an honest and elaborate attempt to give the American stage a year-book as substantial as those which are frequent in France and Germany. It is but little to say that the '*Mirror* Annual' is broader in scope and better made than the British '*Era* Almanack'; it is even worthy to rank with the solid French 'Annales du Théâtre et de la Musique.' It is not perfect, of course—we have noted not a few minor blunders, and the misprints are more abundant than of necessity; but only those who do not know how difficult it is not to blunder in a work of this kind, will be inclined to be hypercritical. The Annual opens with a Chronological Dramatic [and Operatic] Record for 1887, covering not only the United States and Canada, but also England, France, and Germany. Then follow a necrology and a dramatic bibliography for 1887, the latter somewhat inadequate, but to be praised for containing the titles of articles published in periodicals. The full text of the Inter-State Commerce Law is then given, as that act had a deterrent effect, probably quite unintentional on the part of its authors, on travelling companies. Last of all is a classified directory of all the actors, managers, scene-painters, and other inhabitants of the playhouses of this country. There is also an index; and there are half-a-dozen portraits—that of the late John T. Raymond being excellent.

"Utriusque Fortunæ Exemplar" was the inscription placed under a statue of Charles II. erected in the London College of Physicians in 1682. It was not improbably borrowed from Petrarch's Latin prose work, 'De Remediis Utriusque Fortunæ,' which had an extraordinary vogue all over Europe, in more or less complete translations as well as in the original. The bibliography of the 'De Remediis' had never been attempted when Prof. Willard Fiske began the task which now lies completed before us in No. 3 of his "Bibliographical Notices." We need hardly say that it is executed with Prof. Fiske's thoroughness, with the aid chiefly of his own unrivalled collection, of which this brochure of forty-eight pages forms part of the catalogue.

The German Government, having made the collection of works of Greek art in the Berlin Museum one of the richest and most important in the world, by the excavations at Pergamon and a generous outlay every year for the acquisition of original monuments in Greece, Italy, and Asia Minor, is now giving attention to the development of the Assyrian department of the same museum. A committee has been appointed for the purpose of investigating the respective merits of various Oriental sites, and it is believed that excavations will soon be begun on an extensive scale in Persia, which the recent investigations of M. Dieulafoy show to be a most promising country.

We hear that a portion of the old road leading from Athens to the Academy has been discovered, near the graves the discovery of which we noted some weeks since (No. 1181). It is said that this road is not paved, but is distinguishable from the soil about it by its hardness. More graves have been found in the same locality, containing vases and other objects in terracotta, glass, and bronze.

The Linnæan Society of New York make an appeal for funds for the proposed monument over the grave of Audubon in Trinity Cemetery. Contributions may be sent to Mr. L. S. Foster, in care of the Society, No. 11 West Twenty-ninth Street, New York.

A correspondent writes us: "There is nothing new under the sun—not even 'Oil Trusts.' Witness this line, Plautus's Captivi, 489:

"'Omnes *de conpecto* rem agunt, quasi in Velabro *olearii*.'"

—The April *Century* has a noteworthy article upon the part of Alfred Vail in the invention of the Morse telegraph, with a facsimile of the memorandum in which he claims exclusive originality for certain important details of the mechanism. The Vail family were very useful, and, in fact, invaluable, to Morse in the development of his invention, and Alfred was a part owner in the patents. The early history of the practical working out of the idea of telegraphy and of the first experiment by the Government is as interesting as such matter is always sure to be, however many times repeated; and the present account of it is well done. A second article is a critique upon Stevenson from the friendly pen of Henry James. It is preceded by a wonderful portrait which looks more like an Easter egg than anything else. It is amazing that any one should consent to the publication of such a "got-up," cadaverous grotesque as the head of a sane human being, and the memory of it pretty nearly erases Mr. James's pleasant writing, of which, judged as criticism, one recollects little more than that it is compliment rather too long drawn out. The remainder of the number only "marks time," the serials going on with no special distinction, and there being no incidental article of note. The "departments" are well filled, and in the War Papers we observe an anecdote of Gen. Hooker's execution of a poor boy after the war was over, told by Judge Dickson, which on the facts stated was military murder. It is a shocking story, but it is useful as an illustration of the processes of war, and it throws a light on the sort of cruelty that must occur unnoticed in the confusion of martial "justice." Gen. Hooker appears to have acted in this case in a spirit of revenge, but whether for Lincoln's assassination, or out of irritation at the recollection of how Lincoln refused to have men shot, is not very clear. It is bad enough either way.

—It produces a curious *ante-bellum* effect when we find a great popular organization, like the Chautauqua Reading Circle, requiring the compilers of its historical text-books to stop short as far back as the war of 1812, for fear of offending the sensibilities of Southern readers. Yet this is avowedly the case with its authorized manual of American history, as prepared by the Rev. E. E. Hale, D.D. Some inquiries on this subject having been addressed to the Principal of the Reading Circle, Rev. J. L. Hurlbut, D.D., he has the frankness to state the matter in this unequivocal way (italics ours) in the *Chautauquan* ("Notes on Required Reading for November, 1887"):

"Several letters have been received, making inquiry why Dr. Hale's American History closes with the War of 1812, and contains no account of events in recent times, such as the Mexican War, the Civil War, and the reconstruction since 1865. Many reasons could be named why in a circle such as ours these subjects should have no place as a part of the regular course of study, though there is nothing to forbid local circles taking them up. *We have thousands of readers on both sides of the line, and it would be impossible to satisfy one class without grievously offending another, in whatever way the history should be written.*"

When we consider that all the popular school histories bring down the history of the country to a period within twenty years, and that each of these circulates largely "on both sides of the line," so that in fact "the line" may be said to be practically forgotten in the book trade, it is certainly a little amusing that it should still be a reality so formidable among the doctors of divinity who conduct the Chautauqua Reading Circle and write its text-books. Have they really chanced to hear of the surrender at Appomattox and of the Emancipation Proclamation? Again, do they not run an injudicious risk in allowing their pupils to follow American history down so late as the war of 1812? There were very dangerous discussions on slavery in the very convention which framed the United States Constitution; and any narrative of the American Revolution must risk "grievously offending" their Canadian members. Perhaps it would have been better to close their American his-

tory with the year 1492, though even then there would have remained Miss Marie A. Brown to be dissatisfied, as she seriously disapproves of Columbus, and feels no hesitation in speaking her mind.

—From J. B. Lippincott Co. we have the first volume of the new edition of 'Chambers's Encyclopædia' (A to Beaufort). The mechanical part of the work has been improved in respect to the cuts and the maps, but the typography has a too solid appearance, and does not tempt the reader or favor defective eyesight. The staff of writers, so far as revealed, is not comparable to that of the 'Britannica,' with which, however, Chambers's does not strictly come in competition. Several American scholars are on the list, and furnish copyrighted articles, but the want of editing is shown in just this collaboration. The minor American articles have not been submitted for revision to an American authority. One can confidently assert this of the brief article on the Abolitionists; and what American writer would have omitted the *date* of the battle of Antietam? Mr. S. Austin Allibone is erroneously spoken of as the *head* of the Lenox Library in this city. Our Bayard family is ignored. Delia Bacon is admitted, but not Leonard Bacon; Mary Anderson, too, but not Gen. Robert Anderson. The middle name of Hubert Howe Bancroft is not mentioned. Mr. Grant Allen's article on Americanisms is far from profound, and he is wide of the mark in pronouncing Prof. Schele de Vere's 'English of the New World' the best on the subject. "Candy," he recklessly declares, "for every kind of sweetmeat, is common to the entire Union." Under Alaska (a copyright article, but none the less needing editorial oversight) no mention is made of Mr. Dall's leading work on that Territory. But generally, the references to authorities are uneven and inadequate in this cyclopædia.

—Two excellent indexes have recently appeared, to call attention to which affords us pleasure, both because of the rarity of good work of this kind, and also on account of the importance of the matter thus made accessible. The first of these is the 'Deuxième Table Générale de la *Revue Historique* (1881 à 1885 inclusivement) rédigée par Camille Couderc, 1887.' This index, which sells for three francs, is wellnigh perfect as far as it goes, and of course much superior to that example for youth and for age to avoid, the 'Table de la *Revue des Deux Mondes*'; but we are sorry that M. Couderc was unable to free himself entirely from the vicious practice of almost all Continental indexers, of relying solely on a *table raisonnée* instead of a minute subject-index. Thus the *Table* in question gives, as is essential to a good index, an alphabetical list of authors covering five pages, then a list of articles (occupying only two pages), arranged not alphabetically, but chronologically. Following this is the "bibliographie," 98 pages long, prepared on the numerical cross-reference system. This is a list, alphabetical by authors, of all works reviewed, each entry being prefixed by a number. This is succeeded by a "Répertoire méthodique," under the classified headings of which the preceding titles are referred to. Thus, No. 4810 of the "bibliographie" is "Zwiedineck, H. von, Die Politik der Republik Venedig während des 30-jährigen Krieges, XXIII, 398," which is indexed (not under "Venise" or "Guerre de Trente ans," but) as "Italie, § Venise, Vicence, Padoue, Udine, etc., 4810." In the same way, there is no alphabetical entry of Sweden or Norway, they being entered only as divisions of the title "Pays Scandinaves." Per contra, Alsace is to be found not under Allemagne, but in its alphabetical order, as if it were an independent State. Biographies are not indexed, except in the general way of chronological entry under each country. We have noticed but few errors. Mr. Francis Parkman is not, that we know, of German origin, and does not his spell his name with a double *n*, and Mr. Henry Adams, not Mr. Herbert B. Adams, is the author of the life of John Randolph, for which, as well as for his own works, the Baltimore professor gets the credit. Prof. W. F. Allen, again, is unlawfully deprived of his first initial, and putting the French name Des Cars under C is contrary to the accepted rule.

—Another good piece of work, though not to be compared with the 'Table' in regard to minuteness, is the 'Index to the Consular Reports, No. 1 to No. 59 (1880-1885),' lately published by the State Department. Owing to the constantly increasing demand for these Reports—a demand which has induced the British Foreign Office to start a similar series—this index is likely to be widely useful. It is printed in large type, in one alphabet, and occupies 212 pages. Under the name of each consul, printed in small capitals, is a list of the subjects on which he has reported, and the subjects are entered twice, once in the alphabetical place of each, and once under its generic head; *e. g.*, "Arlberg Tunnel" is entered under Arlberg and under Tunnels. Errors are very rare. "Würtemberg" we find spelled both "Wurtemburg" and "Wurtemberg," and the name of the late Wm. Wirt Sikes, sometime Consul at Cardiff, is tortured into "Sykes, Wm. Writ."

—M. Guy de Maupassant gives the readers of *Les Lettres et les Arts* for March (Charles Scribner's Sons) three days more of the Journal of his Mediterranean cruise. This portion of "Sur l'eau" is very far from the lively and amusing cynicism of what preceded it; indeed, it is not easy to imagine anything more painfully depressing than some of these pages, of which the least harrowing present the writer under the gradually approaching and disappearing effects of ether, taken during a violent headache. For those who cherish a personal animosity towards the present realistic school, a certain amount of satisfaction may be derived from the perusal of "Sur l'eau." If M. de Maupassant's report of the effects produced upon the mental and sympathetic faculties of its disciples by the practice of their art may be trusted, existence is a torture to them. The reader may be pardoned for finding the strain upon his own sympathies somewhat relaxed by his enjoyment of the perfection of M. de Maupassant's literary form, and by a certain perception that the suffering for which he demands sympathy belongs in great part to the second and entirely literary self in the double personality which he exposes so pathetically; to the equally vivid conviction, also, that when M. de Maupassant leaves his double at peace, he is a very vigorous and healthy and well-satisfied specimen of humanity, with no lofty aspirations or supersensitive nerves to disturb his enjoyment in the very successful exercise of all his faculties. "Le Gendarme rouge," by M. Théophile Gautier *fils*, of which the second part is now given, belongs to an entirely different school. As is fitting in a story by the son of his father, the author plunges us into the full flood of romanticism as it appears in these latter days, and we find ourselves accepting the trials of the charming Javotte-et-Jacquotte and the attempts at their relief of Gaspard and Joliot, as readily as if realism had never been invented —assisted, it is only fair to confess, by the gentle irony with which both characters and situations are treated. As to the fantastic story of M. Henri Laujol, "Miremonde, conte moral," which begins brilliantly in the present number, it promises amusement at least, and the possibility of something more.

—Those of our readers who are interested in the history of commerce will find much to their purpose in two recent productions of that energetic and untiring spirit of investigation which the Germans call with pride *deutscher Fleiss*. The first of the works we refer to is 'Revaler Zollbücher und Quittungen des 14en Jahrhunderts,' by Prof. W. Stieda of Rostock. In the 138 pages of introduction the author discusses a considerable variety of topics. There is first a study of specific duties in the Hanseatic cities; then follows a dissertation on shipping in the Baltic, which contains much interesting information on the value of the ships, their form, structure, and burden, cargoes, prices, voyages, and the exports from the eastern Hanse cities. But, what is of especial practical value, Prof. Stieda has given a full list of weights and measures, with their equivalents, and copious tables of local coins. The usefulness of such tables will be highly appreciated by any one who has tried to get any information on such points out of the ordinary dictionaries, or even from Ducange. One's search is usually rewarded with the stereotyped answer, "a coin," "a measure." The text proper of this volume consists of specimens of trade documents from the city of Reval, which give one a glimpse of business methods five hundred years ago. The other work to which we alluded is from the hand of Dr. Henry Simonsfeld of the University and the Royal Library of Munich. It is entitled 'Der Fondaco dei Tedeschi in Venedig und die deutsch-venetianischen Handelsbeziehungen,' and is an exhaustive study of the history of German trade with Venice. The first volume, of nearly five hundred pages, is wholly devoted to documents running from 1225-1653, most of them in Latin. The second opens with an historical sketch of South German trade during those four centuries, taking up in particular the administration of the factory in Venice, the articles of export and import, the personnel of the trading community, routes, etc. The second half of the volume contains a list of consuls of the German merchants in Venice, a collection of epitaphs of Germans buried in Venice, supplementary documents, a useful glossary, and an exemplary index of upwards of fifty pages. These substantial volumes are published under the patronage of the Royal Bavarian Academy and by Cotta of Stuttgart.

—The Greek Archæological Society has shown most praiseworthy activity during the past few years. Indeed, when one remembers the poverty of the Greek Government and the very limited number of wealthy citizens in Greece, the enterprise of the Society is surprising, and it is a pleasure to note that its labors have met with the success they deserved, in the various sites investigated. It has shown the Acropolis to be a treasure-house of early Hellenic architecture and sculpture, to an extent one would not have believed possible a few years ago. The discovery of many fragments of pre-Pheidian sculpture on which the colors are in a brilliant state of preservation, and that of the early temple of Athena in the middle of the Acropolis, are in themselves achievements which would have amply repaid the undertaking; but during the last season the discovery of traces of a palace antedating the Hellenic civilization, and in some of its features displaying a marked resemblance to the palace of Tiryns, gives to the Acropolis an entirely new

and unsuspected interest. By the destruction of a Turkish structure, northeast of the Erechtheion, some fragments of the northern frieze of the Parthenon have been brought to light; and, east of the Parthenon, the substructure of the temple of Roma and Augustus has been unearthed. Outside of Athens the Society has continued its work at Eleusis, Epidauros, Mykenæ (where a considerable number of tombs of the "Mykenæan" epoch—that is, in the style of the so-called Treasury of Atreus—have been opened), and Oropos in Bœotia. It is unfortunate for those of us who live so far away from Greece that the full and official accounts of these investigations follow so tardily the investigations themselves. We learn, for example, that those at Oropos have yielded very important architectural results, but must wait indefinitely for the scientific description and illustrations of them. Dörpfeld, in a brief note in the *Mittheilungen* of 1886, stated that the stage of the theatre there was of the Greek epoch and in better preservation than that of Epidauros; and last year the Archæological Society laid bare a stoa adjoining this theatre, over 350 feet in length, the front of Doric architecture, with about fifty columns, the interior divided into three parts by an Ionic colonnade. An extraordinary feature of the edifice was the metopes, which are said to have contained a long inscription.

SAINTSBURY'S ELIZABETHAN LITERATURE.—I.

A History of Elizabethan Literature. By George Saintsbury. Macmillan & Co. 1887.

THIS work, if it does nothing more, indicates a movement in the right direction. What the historians of English literature of the year 3000 A.D. will be compelled to do, the historians of less than 2000 A.D. are finding it desirable to do. The subject is too vast already to be treated satisfactorily by a single writer. Hence the necessity of dividing it into periods. The present volume—one of a series of four—is the first in order of publication, but the second in order of time. It is to be followed by one on the early literature, by Mr. Stopford Brooke; by one on the literature of the eighteenth century, by Mr. Edmund Gosse, and by one on modern literature, by Professor Dowden.

The idea of such a series is an exceedingly good one, but its value will necessarily depend upon its execution. We are bound to say that the present volume does not make us too hopeful. It is, in fact, a grievous disappointment. It is generally supposed to be incumbent on the reviewer to greet even the work which he purposes to praise with a short and subdued critical growl; but the growl in this case needs to be both prolonged and loud. We have rarely met a treatise on any subject much more exasperating. For the book has a great deal of merit in it in a certain way. It is the production of a man who has read his subject, and not merely read about it. It frequently contains striking observations, and passages which display keen critical insight. More than that, there is in portions of it a sanity of statement, a freedom from the extravagances that disfigure most modern criticism, which, if exhibited throughout, would give it a permanent place in the literature of its class. With all this it is one of the most unreadable books that ever offered themselves to be read. It will furnish little pleasure to the student who knows, and little instruction to the student who does not know.

To begin with, it is not an unreasonable thing to ask that a history of English literature should be written in the English language. This somewhat desirable qualification the work before us does not possess. As Mrs. Malaprop was quite the queen of the dictionary, so Mr. Saintsbury is quite the lord of the language. He has certainly extended its conquests further than any living writer, and from the indications contained in this volume there is no speech that is not in danger of being annexed. The reader who expects to peruse the work understandingly must prepare himself for the task by a previous knowledge of French and Italian, Latin and Greek. The last named, in particular, is an absolute necessity. "Marlowe," writes Mr. Saintsbury in his genial way, "with the fullest command of the *apeiron*, had not, and, as far as I can judge, never would have had, any power of introducing into it the law of the *peras*." Things in this volume are not of unknown origin: they are *adespota*. We can say of the author what he says of Daniel, that his English is most certainly "unweakened by purism," but cannot add his further comment upon the language of that poet, that it is "unadulterated by xenomania" (p.136). This pedantry, in fact, is so all-pervading, it is so wantonly, not to say brutally, aggressive, that it reads almost like a joke to have Mr. Saintsbury remark that he hopes he shall not "be suspected of being ignorant of Greek" (p. 379). No misgiving of that sort, he may be assured, will once occur to the reader who is forcing his weary way through this lexical jungle. The thing he will suspect is, that Mr. Saintsbury is ignorant of English.

Bad as are the words, the sentences are worse. Mr. Saintsbury is familiar with French prose, but he has studied it carefully, with the main intent, apparently, to avoid its precision, its clearness, its happy art of saying things agreeably even when it has nothing to say. A more vicious style than prevails in this volume can hardly be found in the productions of any reputable author. There are sentences we have read and reread before we could feel sure of what the writer was aiming to say. There are sentences which we should never have understood had we not known beforehand what the writer was intending to say. There are sentences that would bring despair to the most patient and long-suffering of grammarians. The work, in fact, furnishes an almost inexhaustible supply of every kind of fault which can affect clearness of expression.

The most noticeable one, however, is caused by the fact that many of the sentences really consist of two rolled into one. They are sometimes so involved that the reader who embarks upon one of them is apt to forget the place from which he has started, and fails at the end to recognize the place at which he is landed. They are stuffed with parentheses to such an extent that the resources of the printing-office must have been tested to the uttermost to supply the run made upon the types containing these particular curved lines. The result is, that many of the sentences seem to be suffering from a sort of rhetorical dropsy. We quote part of one found on the second page, not because there is anything exceptional about it—there are scores and scores just like it—but because it mentions with praise an editor to whose merits we are glad to call attention. It runs as follows:

"Mr. Arber's remarks in his introduction (which, though I have rather an objection to putting mere citations before the public, I am glad here to quote as a testimony in the forefront of this book to the excellent deserts of one who by himself has done as much as any living man to facilitate the study of Elizabethan literature) are entirely to the point."

It is not often that a quotation serves so effectually the double purpose of pointing a moral and paying a tribute of deserved praise.

Comments upon style are not apt to be effective when coming from an author who can be guilty of atrocities such as we have described and cited. This sort of work is the more aggravating because these overloaded and obscure sentences are frequently accompanied by others clearly conceived and powerfully expressed, showing what the writer could do if he chose to do it. These latter are, unhappily, too few to affect the general estimate. The volume, as a whole, is the result of that easy writing which makes the hardest of reading. If we were to judge Mr. Saintsbury's style by it alone, we could find full justification for the view that, in the production of slovenly English, he has not only no rival among contemporary writers, he has not even a second.

This is not, however, the principal fault we have to find. While the matter contained in this volume is much superior to the manner, it is nevertheless not of a kind to arouse enthusiasm or to inspire confidence. Mr. Saintsbury assures us, indeed, that he has been diligently reading for five and twenty years the productions of the period he is discussing. But it is quite plain that he has been a student of Elizabethan literature in the same easy sense in which many of us are students of a good many things. At the very outset there are remarks made which tend to arouse suspicion as to the value of his work. His dates and biographical facts, he tells us in his preface, are generally taken at second-hand. There is not the slightest objection to this course. The assertion, in truth, gives the impression of straightforwardness and honesty. The effect of it, however, he proceeds at once to destroy by going on to say that he shall not be much concerned, or, as he expresses it, "be deeply convinced of sin," if some of the unimportant facts and dates do turn out to be wrong. It is one thing to admit your obligations to others in the matter of exactness of information; it is quite another thing to assume a jaunty air as if exactness of information upon minor points was really not a matter of much consequence, and in fact rather beneath the dignity of the gifted being who purposes to take a wide survey of literature as a whole. This is the talk of a man who is unwilling to do the lowly work upon which his lofty generalizations must ultimately be based. Correctness of detail is not the highest of virtues; but it is no contemptible quality in an historian. Mr. Saintsbury hardly seems to be aware that accuracy of statement is not an accident which varies with the importance of a subject, but denotes a habit of mind; and that the man who is indifferent about his dates is not likely to be preëminently trustworthy in the relation of any of his facts.

We see, in truth, the results of this dilettante method of study whenever Mr. Saintsbury leaves the province of special criticism to indulge in general views or to touch upon matters that demand special knowledge, and sometimes, unfortunately, upon those that do not. He is not always acquainted with the nature of the positions he criticises or controverts. The charge, for instance, which scholars bring against Spenser's language is not that he brought together the speech of different periods and of different dialects and even of different tongues, and produced a "poetic diction" that was never actually employed by anybody. It is, that his so-called archaisms are not archaisms, that they are mere verbal blunders arising from his attempting to employ the language of a time he did not fully comprehend. The result was, that he used words and forms that never had any existence at all, under the

impression that they were archaic, and used archaic words in senses they never knew.

We had hoped that at this late day men would be no longer misled by Gifford's perverse contention that Ben Jonson's play of "Every Man in his Humor" was brought out in 1596. That editor had a purpose to serve, and was never very scrupulous in such cases about the value of his evidence. But there is surely nothing to be gained now by talking about recasts and alterations, when Jonson himself expressly tells us that "this comedy was first acted in the year 1598 by the then Lord Chamberlain's servants." We are quoting his very words, and he is not likely to have made an assertion which all his contemporaries would have known to be false. Still, this baseless supposition turns up again in the pages of this volume.

A far more reprehensible statement follows. Warton's venerable fiction about Milton, which never had a decent excuse to show for its creation, is once more retailed as an indisputable fact. "Milton," says Mr. Saintsbury, "to his eternal disgrace, flung for party purposes the study of Shakspere as a reproach in his dead King's face." It behooves him who sets out to revive exploded slanders to make himself acquainted with that (whatever it was) which first suggested them. In this instance it is a passage in the 'Eikonoklastes,' which Mr. Saintsbury has clearly not taken the pains to read. Had he done so, he would have found that he might as well have insisted that Milton was attacking the study of the Pauline epistles, because, in the very same connection and with the same end in view, he represents the Apostle to the Gentiles as the author most read and studied by one of the worst of the Byzantine Emperors. It takes but the most cursory reading of the 'Eikonoklastes' to discover the falsity of a charge which it required partisanship to make in the first place, and ignorance in addition to partisanship to repeat now. He who examines that work will find no difficulty in deciding, as between poet and critic, to whom the stigma of disgrace will attach—though in the latter case there is, for obvious reasons, no danger of its being eternal.

RECENT NOVELS.

The Deemster. By Hall Caine. D. Appleton & Co.

Leon Roch. By Perez Galdós. Translated from the Spanish by Clara Bell. W. S. Gottsberger.

Queen Money. By the author of 'The Story of Margaret Kent.' Boston: Ticknor & Co.

The Second Son. By M. O. W. Oliphant and T. B. Aldrich. Boston: Houghton, Mifflin & Co.

The Dusantes. By Frank R. Stockton. The Century Co.

Paul and Christina. By Amelia E. Barr. Dodd, Mead & Co.

Zorah. By Elizabeth Balch. Boston: Cupples & Hurd.

Ethne. By Mrs. E. M. Field. E. & J. B. Young & Co.

The Story of an Enthusiast. By Mrs. C. V. Jamison. Ticknor & Co.

'THE DEEMSTER' imposes a standard for criticism different from any by which the mass of modern fiction may fairly be measured. The novelist who deals with primitive human passions, developing them through circumstances which lead inevitably to tragic action, challenges comparison with the creators of grand imaginative literature. The supreme virtue of such literature lies in its power to lift people to the height of its theme, and to absorb them in its action as absolutely as in thrilling personal experience. The man who achieves this effect with any sort of completeness must have something in him finer and rarer than literary talent, however brilliant and intelligently trained. Mr. Caine invites the test and stands it with honor. His subjective drama is the old and awful one of good warring with evil in the human heart. There are moments in the conflict when man's will and reason count for so little, when he seems such a puppet of passion and accident, that we can believe he has no control of the issues, and seem to be looking on at a game of dice played by God and the Devil with human souls for stakes. But the prevailing spirit is stronger and more hopeful. No man is so perfect that he may not fall into sin; none too bad for repentance and atonement. The balance hangs trembling in suspense, yet each man is responsible for its turning, subject to no arbitrary fate.

In Dan Mylrea, the great figure of the novel, the fight rages most fiercely. Here is one of those exceptional natures felt to be equal to a high destiny, seen with pain and horror to be going straight down to the gates of Hell. Nothing short of frightful calamity can stop such a man, once he has taken the wrong path, and he must know in his soul that he alone is responsible for the wrong before spiritual purgation becomes possible. The antagonistic forces that rage in Dan have less play in his father, the Bishop, and in Ewan Mylrea. It is a fit of temporary wrath, a maddening sense of final, unpardonable outrage to long-suffering love, that hurries Ewan on to his share in the culminating tragedy. It is in a moment of solicitude for the physical safety of his son that the Bishop, with his faith in God's love and mercy fallen away from him, wishes to do what would tarnish the whiteness of his life and make his very righteousness a reproach to him. The Deemster alone seems to be irreclaimably evil, and his nature has the least affinity with the universal, is largely a product of one age, one locality, and peculiar personal opportunities.

Though tragedy is foreshadowed from the beginning, and sweeps along in a current of increasing force to the end, its sternness is relieved by the form in which the novel is cast, irregular, unstudied, abounding in sharp contrasts of laughter and of tears—the form that links literature inseparably with life. The scene is in the Isle of Man, in the beginning of the eighteenth century. Time and place permit rugged picturesqueness, a certain physical storminess, and add a romantic element like that which the Venetian coloring gives to *Othello's* consuming jealousy. The singular legal forms in force when the Earls of Derby were Kings of Man, provide nice points for plot building, and the technicality by which Dan might be removed from the jurisdiction of his uncle, the Deemster, to that of his father, the Bishop, is used ingeniously. It provides an opportunity, too, for the most impressive single scene in the novel. The Bishop, bowed down with anguish great as David's for his rebellious son, pronounces the fearful punishment for Dan's crime. The moral dignity of the thought here cannot be surpassed, and we must go to the Bible for parallels in commanding simplicity and poignancy of expression.

'Leon Roch' conspicuously illustrates some advantages possessed by novelists of the Latin and Slav races for exciting intellectual interest. If civilization reaches its highest expression in the Anglo-Saxon, it is partly at the expense of originality of thought, independence of action, of much that makes study of character a useful and enlightening occupation. It is not the fault of the contemporary English and American novelist that so vital a difference as that which separates Leon Roch and his wife is quite outside of his sphere of observation, but it is the good luck of Perez Galdós that material naturally presents itself to him which may worthily be offered for the consideration of intelligent people. In the dissection of character he is not obliged to pay deference to squeamish taste and conventional moral ideas. Were he trammelled by a public opinion which shudders at plainness of speech, the character of Maria Roch would be hopelessly incomprehensible. It is easy to understand that she, a religious bigot, not capable of intellectual exertion rising to the dignity of thought, might become by degrees hopelessly estranged from her free-thinking husband. But when she is convinced that to live with him is deadly sin, when in heart and soul they are absolutely divorced, a very radical analysis of her nature is needed to explain her remaining in his house, and her furious jealousy at the thought that his love has been transferred to another woman. Whatever may be said for or against the choice of such a nature for development in fiction, once having chosen it the liberty of plain speech is a great aid to intelligibility. The author lashes Maria unsparingly, but tenderness would be thrown away on such a combination of sensuality, gross superstition, vulgar credulity, and egotistical delight in her own ineffable perfection.

Besides, she is not singled out for scarification. Leon is fully credited with uprightness, rational patience under sore irritation, and intellectual freedom, yet his self-conceit, his harsh, bourgeois didacticism, and his sweeping intolerance when finally exasperated by Maria, her priests, and her family, are put fully in evidence. Still, he always commands sympathy, and one fully believes that his moral principle sufficed him to resist the temptation offered by Pépa Fucar to a very lonely and disappointed man. His continued leniency to the Telleria family is superlatively Christian in spirit, for a more worthless pack, with a certain family likeness of impudence and malice in their worthlessness, never tried the temper and depleted the purse of a son and brother-in-law. Through the Tellerias and their associates the Spanish aristocracy is attacked with a savageness which means either that Spain and the Spaniards are going to the dogs, or that the author is a very wrathful and pessimistic satirist. All the description of the Tellerias' varied depravities, of the journalist Cimarra's scampish audacity, of the Marquis de Fucar's methods of money and title-getting, makes entertaining reading in spite of a disapproving conscience. The talk, even on trivial topics, shows the man stripped of artificial assumptions and reserves, and the descriptions have the pitiless particularity of the French naturalistic school.

Of the dearth of those features in our social life which attract the intellect and arouse emotion, 'Queen Money' is a case in point. The quotation from Horace on the title-page is happily chosen to give a name to a novel reflecting the spirit of that large portion of New York society of which Regina Pecunia is the acknowledged despot. In an early chapter there is some bright talk about American novels and novel-making. While agreeing with the cheerful Mr. Goodspeed, that American life is the proper field for American novelists, and not disputing the dictum of that king of critics, Mr. Clayton White, that it makes no difference whether a man is provincial or cosmopolitan, so long as he has something to say, we submit, on the evidence of this book and many another,

that American life of the cities of the well-to-do, comfortable, even fashionable classes, is a shallow lake to fish in. It is not so easy to find anything to say about it worth the saying. It is a respectable, humdrum life, inwardly clean, taking on sometimes, outwardly, an affectation of Old World moral laxity, which only the exceptional person has either the desire or the courage to put in practice. It is intellectually an empty life, with feelings not so turbulent as to require studied repression; much addicted to pursuit of material pleasure—not sensual enough to imperil the soul's welfare. Passion has no home here, only makes an occasional call on Wall Street, and there for a few hours rides the whirlwind.

The author describes this life just as it is, any exaggeration being due to misconception, not to wilful or stupid misrepresentation. His regret that it is not better or more is plain, and the feeling urges him to make the most of the ardor, honesty, and good aspiration which the country boy, Otto March, brings to town with him, and of the refinement and gentleness of that home where he finds his sweetheart. He perceives, as the unhappy Mr. Charnock says, that half-heartedness is a fault of the age—a convenient absolution for Mr. Charnock and the rest of us, if we were not obliged to reflect that men and women make the age, and that, therefore, each individual is responsible for his share of its defects and virtues. For artistic purposes the author might have preferred that the indefatigable Arria White should have had a more moving grievance against her husband than his disapproval of her salad dressing, and he does faintly suggest one. If he had carried the suggestion further, he would have slandered his society. It is the American's naturally respectful attitude towards women, his innate respectability, which saves our enormously wealthy, notoriously unspiritual communities from moral corruption. It is the bad taste, the physical beauty and vivacity, the mental superficiality and idleness of the Fanny Brockways, that lead foreigners and hasty native purists to very unjust and false conclusions.

Some English reviewers, supposed to be "indolent and irresponsible," have ignored Mr. Aldrich's share in the writing of 'The Second Son.' If the collaboration had not been advertised far and near, and if Mr. Aldrich's name were not on the title-page, the neglect might be regarded as pure oversight. Whatever it may mean, it ought to be accepted as a kindness, a considerate bit of international courtesy. We know Mr. Aldrich as the author of thoughtful and polished verse, and of original, fanciful, brilliant short stories. Where is he in this tedious, voluminous account of the squabbles of an English county family? The situation which makes the excuse for a display of "language" surpassing any of Mrs. Oliphant's former triumphs, is the insistance of a most intolerant and intolerable British father, Mr. Mitford, that one of his three sons shall marry an heiress, Miss Travers. Being free to dispose of his estates as he pleases, he makes disinheritance the penalty of his eldest son's refusal to acquiesce in his matrimonial schemes. The moral to be derived from the dénouement is, that though wrong and injustice sometimes recoil on their perpetrator, the recoil is apt to come too late for the profit of the good and the punishment of the wicked. The situation has the merit of antiquity and the moral the sanction of experience; nevertheless, in neither do we discover points likely to attract Mr. Aldrich, or which he could render highly attractive. The fact is, that he is nowhere to be found, while every chapter and page exhales Mrs. Oliphant. He has politely effaced himself, or, all unconscious, been buried out of sight. Considered as Mrs. Oliphant's work, it falls far short of her greatest excellence. It is honest, kindly, shrewd, unaffected—qualities inseparable from any work of hers, but is also dull and unsuggestive, and may be commended in cases where poppy and mandragora and all the drowsy syrups of the world utterly do fail.

The sequel to the casting away of Mrs. Lecks and Mrs. Aleshine answers explicitly the question, Who were the Dusantes? If they are not so original and amusing as are the good ladies who swept their way to port through the Pacific, they are not exactly disappointing to curiosity. The adventure which brings together the owners of the comfortable dwelling-house, located on a desert island, and its temporary occupants, is one of the happy inventions that distinguish Mr. Stockton's stories from all others, good or bad. On the whole, the story is well wound up, the sailormen are provided with means permanently to testify their devotion to Mrs. Lecks, and the use to which the board money in the ginger jar is put is entirely satisfactory.

Every one knows that when a minister has preached a certain number of sermons, the labor of further production is just to turn a barrel upside down. Prolific novelists are under suspicion of trading in a similar way on the short memory of their public, but few are so heedless or so bold as is Mrs. Barr. She has manufactured 'Paul and Christina' out of the material of 'Jan Vedder's Wife,' only reversing the characters of husband and wife. It is inevitable that writers who depict life in an isolated community, varying but little in essential features from generation to generation, shall in time repeat themselves, and that their work shall finally lose its first charm of picturesque novelty. The Shetland Islands and Hebrides seem to be exhausted very speedily, for Mrs. Barr is not the only novelist whose first story about them has contained all and more than any subsequent one.

The plot of 'Zorah,' a love tale of modern Egypt, is worked out by the aid of witches, subtle poisons, and the mysterious passing to and fro of a signet ring. Mustapha Bey, the hero, has more sweet reasonableness and conscience than Orientals are generally credited with, but his gift of poetical expression and his tendency towards mysticism establish his claims to an ancestry running back to the dawn of time. Zorah, the slave girl, is thoroughly a child of the sun, a creature of only one or two impulses, doomed by herself to accomplish her sorrowful destiny. Her character appeals to Western sympathies but feebly, yet the author has invested it with pathos and not a little of a frank barbarian dignity. Many of the scenes are warm with local color, and the interest of intrigue and character is well sustained to the end.

No men ever did more to assure liberty and its blessings to remote posterity than did the ruthless soldiers of the Lord and of Oliver Cromwell, yet none have assumed to us in the lapse of time such unlovable personality. Especially during the occupation of Ulster, while the natives were being transplanted to the wilds of Connaught, do the Roundheads appear wholly cruel, hypocritical, and inhuman. The character of Roger-Standfast-on-the-Rock, the dominating personality in 'Ethne,' confirms preconceived hostility against his class. He has no vices, but his virtues are insufferable. Without taking into account the circumstances that brought him to Ireland and kept him there, there is nothing in the man that could win the love of a warm-hearted, patriotic Ethne O'Connor. His easy conquest of her affections never appears in any light but its true one—that of a novelist's ridiculously romantic assumption. It is hardly less improbable than Ethne's instantaneous and absolute relinquishment of the faith of her house and nation. The greater part of the story, couched in exaggerated phrases of Puritan cant, is exceedingly tiresome. It bears the stamp, however, of industrious historical research, and several chapters descriptive of customs of the Irish peasantry are well worth reading.

'The Story of an Enthusiast' is superlatively emotional. The people love and hate with great violence, the most frenzied working off their despair by roaming at night among the tombs of the Campagna, thereby entailing disease upon themselves, and causing sorrowful consternation to more moderate friends and relations. The immediate cause of widely diffused anguish is a picture by Raphael of a boy's head in a black beretta. The picture is sold by unfeeling and mercenary guardians, during the hero's minority, and he, with a disregard for his practical welfare truly heroic, devotes his life and fortune to finding the picture and buying it back. He cries a good deal over obstacles, but keeps up the pursuit. During a sane interlude he becomes engaged to be married, but, getting news of the picture just when the bride is awaiting him, unscrupulously leaves her in the lurch. Everywhere, wreck marks the path of his enthusiasm, and contemplation of its devastating force is not likely to mitigate a general intolerance of enthusiasts.

PAVLOVSKY'S RECOLLECTIONS OF TURGENEFF.

Souvenirs sur Tourguéneff. Par Isaac Pavlovsky. Paris: Albert Savine; Boston: Schoenhof. 1887.

M. PAVLOVSKY is the author (whether assumed or real seems to be a little uncertain) of a piece known as "Mémoires d'un Nihiliste." This was written (or arranged) by M. Pavlovsky in Italy in 1878, in consequence of what he calls "le prurit littéraire," and was entitled by him "En Cellule." It was brought to Turgeneff's notice while still in manuscript, and it was through his influence that this "étude psychologique," as its writer styles it, appeared in the *Temps* in 1879, with the title by which it is now known. It was republished, strangely (in 1885), in Hetzel's edition of Turgeneff's works. The probable cause of its being included among them is that its publication in the *Temps* occasioned a violent outburst against Turgeneff in the Moscow journals, because he had prefaced it with a laudatory letter to the editor of the *Temps*. (This letter had been asked for by the *Temps*, as a guarantee that the story contained nothing to offend the Russian censorship and to cause a prohibition of the journal in the Russian empire.) M. Pavlovsky says that he desires to reëstablish, with regard to the history of the publication of 'En Cellule,' the truth which many persons in Russia have unhappily distorted at will." But he does not make the truth very clear. In Turgeneff's prefatory letter he speaks of the paper as "autobiographical memoirs," as "the simple and sincere narrative of what the author has suffered," and praises "the accent of truth" and "the absence of idle recriminations and reproaches." M. E. M. de Vogüé, writing, after Turgeneff's death, of the Russian attacks upon him in consequence of this publication, seems to think that the great romancer may have retouched the paper a little, but adds: "It is not a work of imagination; he had it from one of his compatriots escaped from Russian prisons." But in the volume before us we find M. Pavlovsky himself always speaking

of it as "une nouvelle," and of the prisoner as "the hero"; and he says: "The preface of the author [apparently never printed] explained how the manuscript had come into his hands"—"the author" being himself. He says also that Turgeneff's recommendation of it was as "a literary work, not a political pamphlet"; and states absolutely that "he did not correct these memoirs." Are they memoirs, or is it a story? Has M. Pavlovsky ever been in Russian prisons? The question is not a wholly unimportant one. The answer would decidedly affect one's opinion of M. Pavlovsky, and in some measure of Turgeneff, since he is involved in the curious, vague inaccuracy that veils these points.

M. Pavlovsky's acquaintance with his great compatriot it is clear was neither short nor superficial, and it gave him familiarity with many facts of Turgeneff's life that are of interest; but his book lacks that special quality which makes "remembrances" of value—the quality which creates truth out of facts. It is very instructive, not only as regards their common subject, but as a lesson in "remembering," to put by the side of M. Pavlovsky's volume the paper on Turgeneff which Mr. James published four years ago in the *Atlantic*. That masterpiece of delicate perception and vigorous expression has an admirable breadth, and the personal note of ardent and tender admiration and affection is in delightful harmony with the fuller chords that accompany it. Mr. James "remembers" that when he first met Turgeneff he "could scarcely believe that he would prove—that any man could prove—on nearer acquaintance as delightful" as that first impression. But nearer acquaintance only confirmed the impression. From first to last he found him a man whose literary distinction represented only a part of the large and luminous richness of his nature. This view finds constant confirmation even in M. Pavlovsky's pages, although an offensive tone, almost of malice, pervades the book.

Turgeneff's liberal kindness to his fellow-countrymen of both sexes in pseudo-exile at Paris was literally unbounded; and if it sometimes took the shape of befriending those unworthy of his regard, yet the unfailing touch of generous enthusiasm which made their qualities outweigh their defects in his eyes, had a noble simplicity. Not only five hundred francs here and a thousand francs there passed from his pockets into those of persons "criblés de dettes" (without his left hand knowing how his right hand was pilfering him), but he was always readily active in the deeper charity of investigating into their circumstances and forwarding their interests. And this in spite of a constitutional national indolence and indifference of disposition, and in spite of the fact that his fathering their fortunes not infrequently, as in M. Pavlovsky's case, exposed him to personal annoyance from political causes. As with other philanthropists,

> "Folks with a mission that nobody knows
> Thronged thickly about him like bees round a rose";

and though one may believe that in some of these strange and unfortunate lives there was a dramatic interest that excited his attention and stimulated his imagination and fed the sources of his art, most of them were mere beggars for one or another kind of aid.

Turgeneff organized for their benefit private charitable matinées, where he himself read selections from his own works and those of Pushkin, and Mme. Viardot sang Russian songs, and her son and daughter assisted musically. It was only among the circle of his intimates that he could find support in these good works. The rich Russian colony of the Champs Élysées stood aloof, and feared to compromise itself by contact with those whose necessities might be caused by Nihilism. His French friends had not these hesitations. Soon after the publication of 'L'Assommoir,' Zola consented to take an active part in one of these mornings, but the daring writer found himself unexpectedly the most timid of readers, and an overwhelming attack of stage fright drove him from the platform. Part of the money gained by these matinées was used for a Russian library founded and maintained by Turgeneff. He also organized a club for Russian artists, and endeavored to arrange with them regular evening entertainments, literary and musical, to which the public were to be admitted. But the presence on the first evening (February, 1881) of some well-known revolutionists raised a social storm that burst over poor Turgeneff's head when he was ill in bed, and the soirées fell under the blast.

With young authors he was in constant relations. "During the five years that I visited him," says M. Pavlovsky, "I saw in his hands the manuscripts of at least twenty-five writers. . . . I was present sometimes at his conversations with these authors"; and Pavlovsky gives a sketch of these conversations, which is one of the most interesting pages of his volume. When the author would ask, concerning something criticised by Turgeneff, how it could be bettered, Turgeneff exclaimed, "Comment? Et sais-je comment? Ce n'est pas ça, voilà tout," and would continue: "Don't think that I know how it should be, and will not tell you. To find by search the right expression is impossible; elle doit couler de source." None the less, in a letter here quoted, as interesting as this conversation, he said: "It is idle to wait for the pretended blessed hours of inspiration; if the inspiration comes, so much the better, but one should work whether or no. Not only must one work over one's phrase till it express exactly what one desires to express, and is of the very proportion and quality that one wishes, but one must read and continually study"—endeavor, in fine, to understand the laws of life. It is all very interesting, but should be read in its own place.

Mr. James speaks of Turgeneff's "beautiful faculty of talk." "He was easy, natural, abundant more than I can describe, and everything that he said was touched with the exquisite quality of his imagination." A sentence of M. Pavlovsky's adds something to this: "He had always a quiet manner when recounting anything, and in repeating what any one had said he very rarely gave any imitation of the expression of their face or of their gestures." But one day M. Pavlovsky saw him by chance represent with admirable comic ability a certain M. Boborykin giving a lecture on elocution. M. Pavlovsky adds that meeting M. Boborykin a year afterwards, he recognized him from Turgeneff's mimicry. He says, further, that Turgeneff needed only to see a person once to remember him always, and that his memory was as extraordinary for names and circumstances as for the physiognomy. And not less so for matters of literature. We are told that on hearing a line from Shakspere, Turgeneff could without much hesitation say from what play and even from what act and scene it came.

The first part of this volume is occupied with the account of Turgeneff's relations with Tolstoi, and reports of his talk about him. Later pages treat of Dostoyevsky. All this, and other passages also, we find disagreeable, and must believe untrustworthy. Turgeneff's own words about similar "reportings" come to mind: "Peut-être a-t-il rêvé tout cela. Mais, mon Dieu! quels misérables cancans!" There is also a good deal about Turgeneff's judgments of contemporary French authors. "His opinion of Victor Hugo," says Mr. James, "could not have been expressed in a few words, but admiration, of course, was a considerable part of it. I remember (on Turgeneff's lips) a brilliant description of Victor Hugo's state of mind with regard to himself (Victor Hugo), and as a corollary with regard to others. If it was deliberate and discriminating, it was also pictorial and humorous." With this preface, instead of that prefixed to them by M. Pavlovsky, we commend to the reader two infinitely amusing anecdotes of the great poet derived from Turgeneff. Here, as elsewhere, it is salutary to observe what Mr. James "remembers," what M. Pavlovsky forgets. They agree in their estimate of Turgeneff's warm admiration for George Sand; and M. Pavlovsky quotes a beautiful expression of it from a letter. M. Pavlovsky attributed to him an immense overvaluing of Flaubert. Mr. James puts it justly in saying, "He had a great affection for Gustave Flaubert, and he was much interested in Flaubert's extraordinary attempts at refinement of form and irony of matter, knowing perfectly well when they failed." There are passages of more or less interest in reference to Turgeneff's own works and mode of work; and some few short pieces of his are printed or translated here for the first time. The last fifty pages are an account by him of the execution of Troppmann.

The last words about this most admirable of writers should be Mr. James's: "He was the most generous, the most tender, the most delightful of men; his large nature overflowed with the love of justice."

Classical and Foreign Quotations, Law Terms and Maxims, Proverbs, Mottoes, Phrases, and Expressions in French, German, Greek, Italian, Latin, Spanish, and Portuguese. With translations, references, explanatory notes, and indexes. By Wm. Francis King, M.A., Ch. Ch., Oxford. London: Whitaker & Sons; New York: T. Whittaker. 1887-88.

FROM a single word, like Assumpsit, this collection ranges to any number of lines in prose and verse. In every case that calls for it, reference is (if possible) given not only to the author, but to the work and passage in which the quotation occurs. Besides the translation (often the editor's own, even in verse, when he might have borrowed), parallels are frequently introduced, or applications suggested, or anecdotes related, or witticisms attempted (*e. g.*, No. 701). Hence a certain degree of readability. These are the positive merits of Mr. King's work, and the pains he has been at to verify and locate his selections are worthy of recognition.

In other respects the execution falls far short of the editor's or of any proper ideal. He cites Bayle on "l'exactitude de citer. C'est un talent plus rare que l'on ne pense." But what may we expect when a superfluous word and syllable are thrust into such a commonplace as "Lasciate ogni speranza [o] voi ch[e] entrate"? Here rises up against Mr. King his own censure: "The more familiar the passage, the more commonly is it, in many cases, misquoted." But if we pass from alterations of this sort, and come to scholarly and typographical inaccuracies, the book swarms with them—in fact, is not at all to be depended upon. Take another line from Dante: "Non ragio*nam* di lor, ma guarda e passa"; or the proverb, "Chi é causa," etc. (No. 722). Take the famous verse of Voltaire's: "Le premier qui fût roi, fût un soldat heureux"; or the

phrase "à tatons"; or the needless ligation (No. 4639), "S'il-y-a . . . , il n'y-en-a pas." Take the Greek *passim*. It seems to be Mr. King's rule to put the breathing on the first vowel of an initial diphthong (see Nos. 2875, 3750, 3754, 3907). The grave accent is freely misplaced, as, on the penult in ἄνδρα (No. 3750) and in δεῖνον (No. 1797). Two lines ending with the same word, on opposite pages, have κακὸν (No. 1788) and κακόν (No. 1797). A double accent is used without reason in ὅμιλίαι (No. 3909).

We shall not discuss the editor's scheme of omission and inclusion. Regarding what he brings, we have a right to ask first that it shall be exact and trustworthy, and, secondly, that its contents shall be readily discoverable. The alphabetical arrangement of course counts for something towards unlocking the contents, but very little. One reason is, that Mr. King is not satisfied to give the familiar quotation alone, but as often as not reproduces it with the context. "Ab uno disce omnes," therefore, cannot be found under *ab*, but must be sought under *ac*—"Accipe nunc Danaum," etc. This might have been obviated by a mechanical contrivance, as by lettering more boldly the pith of the quotation, and alphabetizing accordingly; or by an index. Of indexes Mr. King furnishes two, both inadequate and irrational and meagre. One is clumsily described as "of quotations not occurring in their alphabetical order," and under it should be found our "Ab uno disce omnes," but it is not there; while the fatuity with which the index has been compiled is shown by such an entry as "At revocare gradum"—the latter half of a quotation better known by the beginning, and a false reference, since the true text is "*Sed* revocare." The other index is English and topical, and is even more exasperating. Suppose we wish by means of it to get at the Voltairian line cited above. The two leading ideas are King and Soldier. For the former there are twenty-eight bald numerical references under "Kings," and No. 2702 happens to be included, half way down the list; under "Soldiers" there are four references, with none to what we are in search of. Let us inquire whether the "Memoriam cum voce perdidissemus" of Tacitus has been caught by Mr. King's drag-net. Twelve references under "Memory" and three under "Past" fail to reveal it. Is it then wanting to the collection? Who can affirm it, any more than in the case of "Das Ewig-weibliche," which, after having been tracked through some thirty references under "Woman," still remains in the vocative? In his introduction, Mr. King implies that he includes "the mention of the Passion of Christ by Tacitus," but the only index entry to Christ is "Christ, Order of," and one must remember that the passage begins "Auctor nominis," in order to go straight to it in No. 413. The entry just cited, let us say, is absurd in itself, since it is the *motto* of the Order of Christ of Portugal which interests the seeker, and this is easily found in its place—"Christiana militia." Mr. King translates this motto, by the way, "Christian *warfare*." But all his translations must be scrutinized, even if generally correct. Poetical license, for instance, cannot excuse "To wait for one who never comes" as conveying the sense of "Aspettare e non venire" (No. 383).

Some of the defects of the present indexes might have been repaired by an author index; but we fear that slovenliness would have crept into it also. The work is worth overhauling, but by some more competent hand than the present editor's.

Life in the Confederate Army. By William Watson. Scribner & Welford. 1888.

THIS is a personal narrative of experience in the South just before and during the first half of the war. The author, then a young Scotchman, was settled in Baton Rouge as business man and engineer. Though holding to his British allegiance, he volunteered in the Confederate Army, and went through the campaign of 1861–2 in Arkansas and Missouri, of which he gives a graphic picture. His accounts of the battles of Oakhill or Wilson's Creek, and of Pea Ridge, are excellent descriptions of so much of those fights as could come within the ken of an unusually cool and clear-headed sergeant. He subsequently went with Van Dorn to Corinth, but here his description of military affairs has no value, though it is relieved by well-drawn sketches of camp-life. Wounded at the battle of Corinth, he left the army, and in 1863 made his way out of the country.

The book makes no literary pretensions, and properly. The style and grammar are everywhere those of a man without experience in writing, and the number of errors of fact show that the author's reading was limited. His narrowness, too, is often revealed in sweeping criticisms of classes and parties about which he knew little; but in spite of these drawbacks the book is interesting and will repay perusal. The best part of it, perhaps, is his description of the state of feeling in the South in the early years of the war and in the period before it, with his shrewd observations thereon. He traces, with some prejudice, but with great clearness, the gradual change of sentiment among the intelligent non-slaveholding people of the South, by which this great body was converted from strong lovers of the Union into the most zealous defenders of the Confederacy.

"So far as my observation went at the time the act of secession was passed, the population was not unanimously in favor of it, and in most of the States the majority of the people were opposed to it. . . . But the inaction of the Federal Government and their seeming acquiescence in the movement caused many to accept the situation, and when Mr. Lincoln was inaugurated, his seeming indecision and imbecility, followed by the supposed shuffling and deceitful policy of Mr. Seward, caused a still greater number to adhere to the secession party. But when Mr. Lincoln's war proclamation was issued, calling for troops to crush the seceded States into obedience, then in reality did unanimous secession take place. The people within the Confederate States, especially those who had been favorable to union and opposed to secession, were now face to face with the situation. . . . Mr. Lincoln's Government had come into power and had been in power for more than a month, without giving any indication of its policy. That Government had shown no friendly disposition towards, or recognized, the existence of, any Union, or loyal party within the Confederate States. It had made no attempt to settle the matter by a conference and avoid war. . . .

"Of the thousands who at this time rushed to arms, I believe very few had in their minds the question of slavery. . . . The greatest number were animated only by a determination to resist Lincoln's proclamation.

"I can also assert that when the Northerners took up arms in obedience to Lincoln's proclamation, it was only to avenge the bombardment of Fort Sumter, put down the rebellion, and maintain the integrity of the Union. Anything like emancipation was most emphatically repudiated."

The composition of his company from Baton Rouge is of interest: "Planters 9, farmers 11, merchants, clerks, etc., 24, lawyer 1, engineers 4, carpenters 4, painters 3, compositors 3, bricklayers 2, iron moulders 2, gasfitters 2, sawmillers 2, gunsmith 1, tailor 1, druggist 1, teacher 1, carriage-makers 2, cabinet-maker 1, law students 2, marble-cutter 1, miscellaneous 8." The total number of the above who owned slaves, or were members of families who owned slaves, or were in any way connected with or interested in the institution of slavery, was 31; while the number of those who had no interest whatever in the institution of slavery was 55. The natives of the South were 47, of Northern States 13, of foreign countries 26. The percentage of slaveholders as well as of foreigners must have been much above the average in this company.

One of the most striking portions of the book is the description of Butler's rule in New Orleans, and of the effect produced by it upon the Western Confederate armies.

Patrick Henry. By Moses Coit Tyler. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1887.

PROF. TYLER has not only made one of the best and most readable of American biographies; he may fairly be said to have reconstructed the life of Patrick Henry, and to have vindicated the memory of that great man from the unappreciative and injurious estimate which has been placed upon it. Incidentally, he has helped to correct the notion, so common with young people, that unassisted genius, the power of glowing and ready speech, will take the place of severe and systematic labor. Patrick Henry has no doubt been the type and model of the natural orator, and, in most people's minds, of nothing else. The impression has prevailed, as Mr. Tyler says (p. 286), "industriously propagated by the ingenious enmity of Jefferson's old age, that Patrick Henry was a man of but meagre information, and of extremely slender intellectual resources, ignorant especially of law, of political science, and of history, totally lacking in logical power and in precision of statement, with nothing to offset these deficiencies excepting a strange gift of overpowering, dithyrambic eloquence." This impression has been combated and triumphantly dispelled by the work before us. It shows that, with very moderate original resources in the way of training, Henry was an industrious and systematic student, who in knowledge of law was no unworthy associate of the great lawyers of his native State. He had, it must be said, that marvellous facility of acquisition, an outcome of genius, which cannot take the place of industry—and did not in his case—but which, by its intuitive processes, gives to industry a vastly increased power.

Even his original resources were not altogether despicable. His parents were persons of good natural endowments and of good education; his uncle, William Winston, "having a gift of eloquence dazzling and wondrous like Patrick's." His early schooling was insufficient, so that his father himself undertook the charge of his education, assisted by a brother, Rev. Patrick Henry. By this uncle he was so well trained in the classics that, when he was Governor, he was able to converse with a French visitor who knew no English, through the medium of Latin. As to Jefferson's assertion that he was too indolent and too fond of sporting to improve his rather scanty knowledge of law after his admission to the bar, we have the record of 1,185 suits of which he charged fees in the first three and a half years of his practice—nearly twice as many as those of Jefferson himself in the corresponding period of time.

The proof that Patrick Henry was not a mere talker, but a man of intellectual resources and adequate training, is the most important service that Mr. Tyler has rendered to his memory. But he has further proceeded to examine the several points in his career which have been subject to censure or mis-

construction, and almost always with the result of relieving him of a certain amount of odium. In chapter ix. he discusses the question why it was that Patrick Henry's resolutions of 1775 were opposed so vehemently as being premature, when in substance "they lagged weeks and even months behind many of the best counties in Virginia itself, as well as behind those other colonies to which in political feeling Virginia was always most nearly akin" (p. 121); when, moreover, his opponents were themselves "all fully committed to the cause of the Revolution." The answer to this question he finds "not in the resolutions themselves, but in the special interpretation put upon them by Patrick Henry." This was the necessity of war. "Others had said, 'The war must come, and will come—unless certain things are done.' Patrick Henry, brushing away every prefix or suffix of uncertainty, every half-despairing 'if,' every fragile and pathetic 'unless,' exclaimed in the hearing of all men: 'Why talk of things being now done which can avert the war? Such things will not be done. The war is coming; it has come already.'"

We have in the fourteenth chapter an interesting correspondence between Gov. Henry and Gen. Washington at the time of the Conway cabal. It commences with an anonymous letter (p. 215), "evidently by a personal friend, a man of position, and a master of the art of plausible statement," written to Gov. Henry in the interest of that cabal. This letter was at once forwarded by Henry to Washington, with a letter expressive of entire confidence and friendship. Washington, in his reply, indicates Dr. Rush as the probable author of the letter. This incident, says Mr. Tyler, "is to be noted by us, not only for its own exquisite delicacy and nobility, but likewise as the culminating fact in the growth of a very deep and true friendship between the two men." This friendship, he adds, had "but a single episode of estrangement" during their lives.

This episode of estrangement was no doubt due to the ardent opposition made by Henry to the Federal Constitution, an opposition by which Washington was much grieved, and which no doubt created a certain coolness, lasting until Henry's hearty support of Washington's policy at a later stage. This part of Henry's career—the fight against the new Constitution, and that to secure amendments to it—is described very fully, and we are enabled to understand thoroughly his attitude and motives. We suppose that there are few at the present day who will not agree with Henry and his associates, that amendments in the nature of a bill of rights, such as were actually passed, were imperatively necessary; while events have clearly shown that beyond this his apprehensions of evil from the new instrument were not well founded. His opposition was certainly not factious, nor was it carried beyond the limits of constitutional obligation; we have no doubt, however, that his feeling was so intense and expressed so intensely that it gave reasonable offence to the supporters of the Constitution, and excited a not unnatural animosity in them. Mr. Tyler hardly does justice to this aspect of his character; it seems quite certain, from his own account, that this must have had much to do, not only with the estrangement at this time, but with the bitter antagonism which Henry excited in 1775.

The warmth of feeling which made him a strong and almost bitter partisan on these occasions, is a principal element of the generous and lovable features of his character. "While the war lasted," we are told (p. 258), "no man spoke against the Tories more sternly than did he. The war being ended, and its great purpose secured, no man, excepting, perhaps, Alexander Hamilton, was so prompt and so energetic in urging that all animosities of the war should be laid aside, and that a policy of magnanimous forbearance should be pursued respecting these baffled opponents of American independence."

The peculiar merit of this work, in throwing a substantially new light on many parts of its subject—a thing seldom possible with regard to men of so recent times—is derived from the judicious use of a great mass of unprinted material, partly collected by Wirt, for the purposes of his book (but only in part used by him), partly collected within the last thirty years by Mr. William Wirt Henry of Richmond, a grandson of Patrick Henry. Especial mention is made of "a document belonging to Cornell University, written by a great-grandson of Patrick Henry, the late Rev. Edward Fontaine, and giving, among other things, several new anecdotes of the great orator, as told to the writer by his own father, Col. Patrick Henry Fontaine, who was much with Patrick Henry during the later years of his life."

In conclusion, we will repeat that while Mr. Tyler has enriched our literature with an excellent work of biography, he has done us a still greater service by showing that our greatest orator was also an industrious and careful student.

The Fleet; Its River, Prison, and Marriages. By John Ashton. Illustrated by pictures from original drawings and engravings. Scribner & Welford. 1888.

THIS is a new volume of the antiquarian works of Mr. Ashton with which he has illustrated old London life for the present age with much fulness, and usually in an entertaining way. The Fleet Prison is the subject of a comparatively small portion of the book. The river is the true subject, and the story runs for the most part with its course, beginning with very ancient times, when the region in its neighborhood was noted for the medicinal or "holy" wells which have left their names so thickly in that part of London. Of this earlier period little is known, and Mr. Ashton, as he comes down the stream from Hampstead and Kentish Town, finds its banks much more thronged with the gay citizens and apprentices out on their holiday, drinking tea or eating hot rolls and butter, or dancing or indulging in less harmless amusements, at the various spas that successively rose and fell in popularity—the White Conduit Gardens, Miles's Musick House, Sadler's Wells, and Bagnigge Wells. Many curious anecdotes and some interesting cuts recall the free fashions of the time. The stream then comes into the neighborhood of prisons, and we have descriptions and the history of the Cold Bath Fields Prison, Ludgate, and Bridewell; by the way one sees the chapel of Lady Huntingdon, the Bear Gardens and sword play, with Hockley-in-the-Hole, the thieves of Field Lane, Ely Place with its many historical associations, Fleet Market, the Gordon Riots, and the anarchy of Alsatia and Whitefriars. The manners and customs of all these localities, with many cuts, are the more interesting portion of the book.

The latter part is devoted to the Prison and to the so-called Fleet Marriages. The account is mainly of value as an example of the change in prison ways and discipline due to modern days. The freedom of the prisoners among themselves, their occupations, and the system of fees and privileges, the brutality of some of the warders, and especially of the notorious Bambridge; the tricks practised on novices, and the pathetic sufferings of some of the innocent men who were guilty of no fault but the misfortune of debt, are passed in review. It is all something of a medley of vice and coarseness, violence and drunkenness, and low comedy, but it is a lively picture of what sort of a thing life in the Fleet was, and it was in reality brutal enough to make us congratulate ourselves on the change in public morals since that time.

The Fleet Marriages, until put an end to by Lord Hardwicke's Act, were an extraordinary abuse, and some curious prints of the couples arriving in the street and getting out of the coach to get united by the first parson who caught their eyes, are reproduced. The income from these marriages was often very considerable. Walter Wyatt in October, 1748, made, according to his account-book, £57 12s. 9d., which, reckoned in our money, would give him £2,500 a year. Keith, one of the most thriving of these parsons, wrote, in a book of 'Observations on the Act for Preventing Clandestine Marriages,' that he had often asked how long the parties had been acquainted, and the generality answered not more than a week, some only a day or half a day. He celebrated thousands of such marriages. The registers were collected and kept, and may still be examined, but they are not admitted as evidence in law. Mr. Ashton's account is summarized from Mr. Burns's monograph on the subject, which is a curious episode in the history of marriage. There were some instances of two women going through the ceremony with each other, and other curious matter is to be found in these pages.

Altogether the volume, although it does not touch on the literary history of the prison at all, is an entertaining collection of antiquarian material relating to old London. It is, as is well understood, not fresh in any important degree, but a popular compendium of out-of-the-way knowledge.

The Story of Creation: a Plain Account of Evolution. By Edward Clodd. Longmans, Green & Co. 1888. 8vo, xvi, 242 pp., illustrated.

THE reviewer notes, in these days, that popular text-books of evolution appear as plentifully as demolitions of Darwin used to do a few years ago. We would not be so unkind as to suggest that they are written by the same people, though some of them have very familiar earmarks. Perhaps they may be regarded as illustrations of the law that action and reaction are equal and in opposite directions. We referred not long since to the very straightforward and simple little volume by Prof. Heilprin on this subject, and now we are offered a more pretentious contribution to the same department by Mr. Clodd.

This volume is not intended by its author to deal solely with organic evolution, but, as he explains with characteristic turgidity,

"that theory deals only . . . with the origin of the myriad species of plants and animals; and the prominence given to it in virtue of its more immediate interest makes us apt to overlook the fact that it is only a small part of an all-embracing cosmic philosophy. For whatever lies within the phenomenal—the seen or felt—and therefore within the sphere of observation, experiment, and comparison, whether galaxy which only the telescope makes known, or monad whose existence only the microscope reveals, is subject matter of inquiry, both as to its becoming and as to its relation to the totality of things. It is this more general conspectus of evolution as a working hypothesis which, if it does not explain every fact, is inconsistent with none, that the following pages are designed to give in clear, and, as far as possible, simple words.

"Before attempting this, it is desirable to outline the phenomena which that theory explains; and the first part of this book will therefore describe such matters as the stuff of which all things are made, its combinations, affinities, and distribution; the relation, likeness, and unlikeness between the stellar and solar systems and between the earth and its fellow planets; the varied forms and conditions of past and present life, and the relation between these and the inorganic or non-living—in brief, whatever makes up the visible universe" (p. 3).

To carry out this programme in less than 250 pages, with quotations from Milton, Matthew Arnold, etc., interspersed freely, and lavishly illustrated, is indeed, as Artemus Ward would have put it, to take a large contract.

Mr. Clodd is a friend and admirer of Grant Allen, to whom this book is dedicated. Its faults are the faults of Grant Allen exaggerated, while, alas! the clear and attractive literary style, the simple yet precise mode of statement, and the flavor of wood and hedgerow, which are among Grant Allen's virtues, may be sought in vain in the pages of Mr. Clodd. We believe that the latter, while evidently a tyro in physics and an amateur in biology, has done his best to represent the cosmos in accordance with the present state of knowledge. He has compiled from excellent authorities, and much of his material is reliable and authentic. This has not prevented him, however, from referring to a fossil crawfish as an encrinite (Table, fig. 4), and classifying the tunicates among the mollusks. His is what Teufelsdröckh would term a "scissors-intelligence."

"In the kingdom of the blind the one-eyed is king," and it is possible that the very ignorant may receive some knowledge from such books as this; that the progress of true science may be less impeded by such publications, when intended to be friendly, than if the same want of power and obscurity of diction were exerted in an antagonistic spirit. In either case the slop-work is not to be commended. The get-up of the book is neat, the illustrations, though not always new, are of good quality, and the publishers have done their part well.

Ueber Lesen und Bildung. Von Anton E. Schönbach. Gratz: Leuschner und Lubensky. 1888.

THIS handsome little volume has interested us in two ways: in the first place, it is the work of a thoughtful man and a good writer upon the always engaging subject of "Culture and Reading"; secondly, it is the work of a German who, in confessing his intellectual obligations in his preface, mentions only English and American authors. "It will be noticed," says Schönbach, "how strongly Ralph Waldo Emerson has influenced my entire conception of the matters treated. I should regard it as the best result of my labors if they contribute somewhat towards making the writings of Emerson better known among us." The English writers to whom acknowledgments are made are Sir Arthur Helps, John Morley, Ruskin, and Frederick Harrison. From this list it will be noticed that the name of Matthew Arnold is conspicuously absent; nor is any mention made of what we should regard as the two most helpful books ever written upon the general subject of culture, namely, Hamerton's 'Intellectual Life' and 'Human Intercourse.' It is, however, only just to our author to remark that both Hamerton and Arnold are referred to in the body of the volume.

Naturally, the first difficulty that confronts the writer upon culture is to determine what culture is. Beginning with Seneca and the younger Pliny, Schönbach endeavors to characterize the intellectual ideals of Greek and Roman antiquity, of the Middle Ages, the Renaissance, and the modern period. Present social conditions are considered at some length, and thus the question is reached: How is culture attainable for the modern man? The various aids are discussed, and their relative efficiency appreciated. First, there is the school. The school, regarded as an institute of culture, is more and more missing its aim (it is to be remembered that the German gymnasia are more particularly referred to). The scholar suffers from over-feeding and from drill. Specialists cram their pupils with "Kenntnisse," but "Kenntnisse sind eben nicht Bildung; Bildung macht reif und frei, Kenntnisse nicht." As to the universities, they no longer pretend to subserve the ends of culture. Even the philosophical faculty has come to represent nothing but a vast collection of bread-and-butter specialties. Next in order, the efficacy of social intercourse is considered, and the unfortunate circumstance dwelt upon that one must be already a person of culture before his fellow-beings will give him the best they have in the way of conversation. Then attention is directed to travel, the theatre, the newspaper, none of which are ranked very high by the author as promoters of culture. Thus we are brought to the agency of books, and the bulk of the volume is taken up with reflections upon reading.

In these reflections we find a variety of topics touched upon in an interesting and suggestive manner. As will have been already inferred, Herr Schönbach is of those who "care for abroad." He is much occupied with international comparisons respecting the condition of letters and of literary taste. "Americanization" does not seem to be for him the bugbear it is for certain German patriots. He speaks almost enviously of our public libraries, in connection with those of England and Scandinavia, and comments upon the Chautauqua enterprise as evidence that the American appetite for culture is keener and more universal than the German. On the other hand, he thinks it a grave question whether culture is compatible with triumphant democracy, and looks with solicitude upon a country where "the coachman, or the mason, or the street-sweeper calls out, 'I am as good as you' to the gentleman that employs him, when the two meet *in their Sunday clothes* at the ballot-box." Considerable space is devoted to counsel—and good counsel it is, too—with regard to reading. Of this part of the book the best portion is a discussion of Emerson's three rules, to read no book that is not a year old, no book that is not famous, and no book that does not please.

The Fall of New France. 1755–1760. By Gerald E. Hart, President of the Society for Historical Studies. Montreal: Drysdale; New York: Putnams.

THIS book consists of a paper read before the Society for Historical Studies of Montreal. It is an abridgment of the story of the "Old French War," adding no new facts, and perverting many old ones. It is not the work of a trained hand; the style is crude, and slips in grammar abound. The writer has taken pains to consult such published authorities as were within his reach, but want of close attention and a total absence of critical judgment have led him into numberless errors. He says that no ship is known to have sailed through the Straits of Belleisle before 1755, forgetting the familiar case of Jacques Cartier in 1534 and 1535, to say nothing of later instances. He speaks of Sir William Johnson as living in 1755 on the Mohawk in the "western part of New York State," and says that he went to Fort William Henry before that fort was built. In the same year, 1755, he says that the "New England colonies" had a population of 1,200,000, thinking, perhaps, that the name of New England covered all the British colonies. He cites Captain John Knox as saying that 9,580 Frenchmen were opposed to Wolfe at the battle of Quebec. Turning to the place referred to, we find that the number given by Knox is 7,520. But of such examples there is no end.

Of his use of language a few instances may be given: "Libertinous," meaning libertine, or, perhaps, libidinous. "The storming of Quebec," meaning the bombardment—Quebec was not stormed. "A precipitous rush from the grenadiers," and again, "a precipitous attack," meaning precipitate. "The reflex of the Court upon the people occasioned an apathy for national glory." "His first selection could not have been more sapient," meaning wiser. "His [Vaudreuil's] fame, sociability, and popular administration had preceded him." In the following, Mr. Hart appears as a military critic: "He [Washington] should have held his ground with probably ultimately a result of a complete rout to his attackers" (p. 16).

Here is a specimen of both matter and manner: "From the 6th of July in the morning until the 9th, Abercromby invested this fort [Ticonderoga], but, strange to say, his shot fell short of its mark, his attacks futile, and notwithstanding his numerical superiority, he was defeated in several engagements his brave opponents met him with" (p. 87). (1) Abercromby never invested the fort or even attacked it; he merely assaulted a breastwork half a mile from it. (2.) His shot did not fall short, for he attacked solely with musketry at close range. (3.) He was not defeated in several engagements, but in one. (4.) He was forced to retreat not on the 9th, but on the 8th. Here are four blunders in five printed lines, and this concerning one of the chief events of the story. They would all have been avoided if Mr. Hart had read with the slightest attention any one of the numerous authentic accounts of the affair, or even if he had consulted a good school history. The object of the Society for Historical Studies deserves all praise, but it will do well, for its own sake, to restrain the literary activity of its President.

The illustrations of the book go far towards redeeming the deplorable shortcomings of the text. They are chiefly facsimiles of old engravings, all of them interesting and several very rare. They are excellently reproduced by the "artotype" process. There is also a facsimile of a letter of Wolfe, and a photographic print, exceedingly well done, of the original portrait of Montcalm.

Under the Southern Cross; or, Travels in Australia, Tasmania, New Zealand, Samoa, and Other Pacific Islands. By Maturin M. Ballou. Boston: Ticknor & Co. 1888. 12mo, pp. xi, 405.

MR. BALLOU'S previous books of travel have prepared us for the present one. The same enjoyment in travel, the same rambling looseness of style, the same vivacity and variety of observation, and the same carelessness of statement are noticeable through this book, which is full of attractive description; but there is a certain temerity in the enjoyment of what Mr. Ballou writes, because he is so often untrustworthy in statement. To mention some of the errors in the few pages devoted to the Hawaiian Islands:

the latest eruption from Mauna Loa is given as occurring in 1868, but important eruptions occurred in the years 1873, 1881, and 1887. The diameter of Kilauea is put at eight miles instead of three, and its elevation at 6,000 instead of 4,040 feet. The heir apparent to the throne is not the King's brother, but Lydia Paki Dominis; nor can Queen Emma any longer be "almost daily seen driving out in a pony carriage," her death having occurred in April, 1885. As to cannibalism, Mr. Ballou is all wrong; within fifty or sixty years, he says, "the natives made war upon one another principally for the purpose of securing prisoners whom they roasted and devoured." The last inter-island warfare was in the year 1795, when the first Kamehameha completed his conquest of the group, and cannibalism was never a national habit of the Hawaiians, either in war or peace, though fallen enemies were sometimes devoured; and the great "rock platter" in a valley near Honolulu is still shown as the place where the roasts, known as "long pig," were carved for distribution. But there is no record or tradition of systematic cannibalism in Hawaii.

The larger part of the volume is devoted to Australia, Tasmania, and New Zealand. It is equally readable and equally inaccurate. We open the book at chance, and we find that New Zealand is as far from Australia as Africa from South America. The great circle distances are about 1,250 and 1,850 miles respectively.

Errors aside, Mr. Ballou has made a readable book. Among other curious facts he states that the railways in the different colonies of Australia are of three different gauges, and that they were so constructed, to the embarrassment of travel and traffic, as a result of intercolonial jealousies.

Architectural Drawing. By R. Phene Spiers, F.S.A., Architect, Fellow of the Royal Institute of British Architects, etc. Preface to the American Edition by William R. Ware, Professor of Architecture in the School of Mines, Columbia College. Cassell & Co.

AMERICAN architects who keep the run of what is done in their profession, will not need a guaranty for the quality of anything that Mr. Spiers publishes touching architectural education; and to students, for whom this book is specially intended, Prof. Ware's cordial introduction is enough. The book is comprehensive, catholic, clear, and orderly. It covers the whole field of architectural draughtsmanship, from office tracing and the preparation of working drawings to sketching in the field and rendering perspectives for competitions. Mr. Spiers's experience as practising architect and instructor enables him, without encumbering his treatise with detail, to give at all points what is communicable and helpful in the way of method. The student will be stimulated by what is rare in books of this kind, a constant and enlightened regard for the artistic side of draughtsmanship. He may learn many good lessons outside the routine of teaching—as, for instance, when he is warned against mere tricks of handling, or is told, on the other hand, that a drawing rendered in thick lines looks richer than the building it represents, while one in very thin lines may mislead the architect himself to meagreness, and tempt him to excess of detail.

The illustrations are of real value, being reproductions of drawings by architects who are exemplary—Messrs F. P. Cockerell, Street, Norman Shaw, Waterhouse, Pearson, Ernest George, Mr. Spiers himself, and others. As we might expect from an architect of French training, the author does justice to brush work, and does not give undue prominence to pen-and-ink drawing, which facility of reproduction has overexalted nowadays, so that many draughtsmen, to their own injury, do nothing else. We must complain, by the way, for it has some currency, of his use of the word "etch" for the working up of a pen-drawing, which is an injury to its lawful signification, applied to a plate bitten by acid. The drawings represented are of all kinds, in pencil, ink-line, ink-wash, sepia, and tinting in colors. Mr. Cockerell's are most instructive examples of beauty, simplicity, and variety of method; Mr. Norman Shaw's hardly does justice to the freedom and picturesqueness of his pen-work. Mr. Bidlake's drawing of a porch of Lincoln Cathedral is a model of sureness of hand, tempered by picturesque feeling. The lithographs come as near the originals as the process allows; though gray ink is hardly a fair representative of pencil-drawing, whose accent it misses, and the sepia drawing of Mr. George is harsher in effect than any work we have seen from his hand. But the student will still find them better than any copies he can make of them.

BOOKS OF THE WEEK.

Bond-Walpole. Selections from Arrian. Macmillan & Co. 40 cents.
Brunn, H. Denkmäler griechischer und römischer Sculptur. Part I. London: Asher & Co.
Capes, W. W. History of the Achæan League as contained in the remains of Polybius. Macmillan & Co. $1.60.
Carles, W. R. Life in Corea. Macmillan & Co. $4.
Child, Prof. F. J. English and Scottish Popular Ballads. Part V. Boston: Houghton, Mifflin & Co. $5.
Marcou, J. Nouvelles Recherches sur l'Origine du Nom d'Amérique. Paris.
Metropolitan Church and Choir Directory of New York and Brooklyn. New York: M. C. & C. D. Pub. Co., 21 E. 14th St.
Page, T. E. P. Vergili Maronis Aeneidos Lib. VI. Macmillan & Co. 40 cents.

The Man Behind.

A SECOND SUCCESS by T. S. Denison, author of 'An Iron Crown,' is equal to its noted predecessor, which has been pronounced "one of the world's great novels."

"Marked by originality, force, and novelty of scene and character. It has a plot and a good one. The book is full of dramatic situations and incidents, and exhibits in places a remarkable analysis of the workings of the human mind. It depicts the struggle between ambition, cupidity, and conscience. Frequent touches of human nature either pathetic or humorous, a careful and graphic style, powerful and realistic character drawing, and a faithful portrayal of time and locality, combine to make Mr. Denison's novel a strong and not easily forgotten work."—*Daily News, Chicago.*

"The ways of the world are disclosed in a most telling manner. Even its secrets are given away, and therein lies the great interest of the book."—*Ohio State Journal.*

"Vigorous and lifelike."—*Brooklyn Eagle.*

"From preface to finish it is of entrancing character."—*Albany Press.*

"One thing is certain, whoever begins to read this story will read it to the end."—*Utica Press,*

The hero has in his history a magic akin to mesmerism. It is a heart throb of humanity. The story of his fall, remorse, triumphs, and defeat, is a picture that is destined to glow permanently in the pages of English literature.

Price, cloth, postpaid, $1.50.

Garden and Forest.

The new illustrated weekly journal of Horticulture, Landscape, Art, and Forestry has been universally pronounced by the press of the country to be the best and most attractive journal of its class ever published in the United States. Every one who cultivates flowers or ornamental trees or shrubs at his home should read it.

The early numbers have contained articles by Mr. Francis Parkman, the historian, Professors Sargent, Farlow, Goodale, and Wolcott Gibbs of Harvard; Prof. Packard of Brown University; Prof. Hilgard of the University of California; Prof. Beal of the Michigan Agricultural College; the Rev. E. P. Roe, Dr. C. C. Abbott, Robert Douglas, and many other distinguished specialists.

It is the only horticultural weekly published in the United States.

For sale at all News-stands.

PUBLISH THIS WEEK:

I.

Evolution and its Relation to Religious Thought.

By Joseph Le Conte, Professor of Geology and Natural History in the University of California; author of 'Elements of Geology,' 'Religion and Science,' etc. With numerous Illustrations. 12mo, cloth, price, $1.50.

"Much, very much has been written, especially on the nature and the evidences of evolution, but the literature is so voluminous, much of it so fragmentary, and most of it so technical, that even very intelligent persons have still very vague ideas on the subject. I have attempted to give (1) a very concise account of what we mean by evolution, (2) an outline of the evidences of its truth drawn from many different sources, and (3) its relation to fundamental religious beliefs."—*Extract from Preface.*

II.

"Good Form" in England.

By an American, resident in the United Kingdom. 12mo, cloth, price, $1.50.

"The *raison d'être* of this book is to provide Americans—and especially those visiting England—with a concise, comprehensive, and comprehensible hand-book which will give them all necessary information respecting 'how things are' in England. While it deals with subjects connected with all ranks and classes, it is particularly intended to be an exhibit and explanation of the ways, habits, customs, and usages of what is known in England as 'high life.' Such being the society to which American ladies and gentlemen have the *entrée*, it is hoped that the book will be useful to them."—*From the Preface.*

III.

Ballades and Rondeaus,

CHANTS ROYAL, SESTINAS, VILLANELLES, Etc. Selected, with Chapter on the Various Forms, by Gleeson White. 18mo, cloth, extra gilt, price, $1.00.

"Mr. Gleeson White's collection of specimens of English verse in certain foreign metrical forms that are conveniently styled French is curious and instructive, as well as thoroughly representative. . . . We must commend the historical section of Mr. White's introduction and his careful analytical observations on the various metres. As the collection itself is derived from every available source, from English and American writers, from dead periodicals and living, books read and books neglected, so also is the editor's industry of the most thorough and searching kind."—*Saturday Review.*

IV.

NEW VOLUME OF ROSCOE AND SCHORLEMMER'S CHEMISTRY.

Treatise on Chemistry---Part IV of Volume III.

By H. E. Roscoe, F.R.S., and C. Schorlemmer, F.R.S., Professors of Chemistry in the Victoria University, Owens College, Manchester. Part IV, Volume III. 8vo, cloth, xi-566 pages, price, $3.00.

This part includes a description of the Aromatic Compounds containing seven atoms of Carbon. The first portion is concerned with the Toluene Group, then come the Benzyl, Benzoyl, and Hydrobenzil Groups, and lastly the Xylene Group of eight Carbon Compounds.

*** *For sale by all booksellers; or any work sent by the publishers by mail, postpaid, on receipt of the price.*

WILLIAM R. JENKINS,

PUBLISHER OF

French Books,

851 & 853 Sixth Ave., New York,

HAS NOW READY:

A new and elegant edition of Victor Hugo's powerful romance,

Quatrevingt-treize,

which he has issued in similar style to his new and handsome edition of 'Les Miserables,' published last year. It is a story showing Hugo at his best—full of action, romantic and picturesque in its incidents, and written with great vigor and power. In its new dress it will undoubtedly be well received by those wishing an excellent edition of the author's works at a reasonable price. 12mo, paper covers, $1.00; cloth, $1.50.

RECENTLY PUBLISHED:

Les Miserables.

By VICTOR HUGO.

A most attractive edition in French of this great work, printed from new type, 5 volumes, 12mo, paper, $4.50; cloth, $6.50; half calf, $13.50.

La Neuvaine de Colette.

NO. 9 OF ROMANS CHOISIS.

A bright, amusing, and clever story of a young girl's romance, which has been highly praised by the press both here and in Paris. 12mo, 60c.

Boum Boum.

By JULES CLARETIE.

An exceedingly clever and touching little story, to which is added several other *contes* of equal charm and interest. 18mo, 25c.

Le Maitre de Forges.

By GEORGES OHNET.

A new edition of this powerfully interesting French novel—probably the most successful story published in Paris during the past ten years. 12mo, 60c.

Graziella.

By A. DE LAMARTINE.

A very pretty edition of this idyllic love story and masterpiece of French style. 12mo, 40c.

Full catalogues of Mr. Jenkins's French and Italian publications and importations sent free on application.

LOOKING BACKWARD, the latest novel by Edward Bellamy, presents a marvellously beautiful and pacifying picture of American life, A.D. 2000, in a vast, happy, competitionless, crimeless, paternal, serene Republic, where individualism and monopoly, and the dread strugle for existence find no place. The Boston *Advertiser* calls it: "Immensely interesting and immensely suggestive." $1.50.

QUEEN MONEY, the brilliant new novel, by the author of 'The Story of Margaret Kent,' has already passed into its fifth large edition. It is a wonderful story of New York society. $1.50.

DR. PEABODY'S

HARVARD REMINISCENCES, that delightful volume of anecdotes and incidents of the famous men of the University (like Felton and Palfrey and Sparks) with its high-bred manner and genial humor, is very popular among men of cultivation, old or young. $1.25.

UNDER THE SOUTHERN CROSS is Mr, Ballou's new book of travels in Australia, New Zealand, etc. This record of the author's travels last year is written with delightful *bonhomie*, and makes a fascinating companion for Fireside Travels. The same writer's recent book of Scandinavian and Russian travel, *Due North*, is a vivid account of the cities and peoples between the North Sea and the Volga. $1.50 each.

OUTLOOKS on Society, Literature, and Politics, the latest volume of Edwin Percy Whipple's essays, contains very interesting chapters on Mr. Lowell, Lord Bacon, Dickens-land, Darwin, etc. $1.50.

Sent postpaid on receipt of price, by

TICKNOR & CO., Boston.

The Nation.

NEW YORK, THURSDAY, APRIL 19, 1888.

The Week.

THE resolution to postpone the Direct-Tax Refunding Bill till next December, adopted unanimously by the Democratic caucus of the House, is a triumph for the opponents of the measure. The bill is not likely to gain friends during the interval, and if it be true that one of the main purposes of it was to reduce the inflammation in the public finances without removing the cause—*i. e.*, to empty the Treasury without cutting down the taxes—that bad motive will no longer operate to defeat or retard action on the Tax and Tariff Reduction Bill. There is reason to believe that the greatest impelling force behind the Direct-Tax Bill was the claim agents' lobby, among whom some hundreds of thousands of dollars would have been distributed if the bill had passed. The postponement of it is an apparent victory for filibustering as a method of carrying on government, but it is evident now that the filibusters have surrendered more than their opponents, because they have agreed that a vote shall be taken on the 11th of December. All that they have secured is delay. If after the lapse of eight months, and after the thorough discussion the measure will receive, a majority of the House still desire to pass the bill, it will be passed without factious opposition. Government by the majority, therefore, has not received any serious detriment. We regard the bill itself as one of the most indefensible and demoralizing that have ever been introduced, since it carries the seeds of the vicious principle that taxes may be imposed by the National Government for distribution among the States. Nothing more demoralizing or unsettling can be imagined than a system of taxation which at once relaxes the watch and guard of the taxpayers on their local governments, and furnishes new sources of supply to the tax-eaters.

The passage of Mr. Beriah Wilkins's resolution, declaring that in the judgment of the House of Representatives the Secretary of the Treasury has authority under existing law to apply his surplus funds to the purchase and cancellation of United States bonds, is a happy deliverance from a painful situation. The Senate having already passed a similar resolution, all doubts are removed. The Beck amendment providing for the coinage of more silver is left dangling in the air. Entire liberty of action is now in the Secretary's hands, and the onus is likewise upon him to employ his discretion under the law. Of course his ability to purchase bonds hinges on the willingness of the holders to sell. Yet the bond market has undergone considerable change since he stopped buying for the sinking fund last year, there being now forty or fifty millions of bonds in his hands as security for Treasury funds deposited with the banks, the sale of which he can force by calling in the deposits. Altogether, the financial situation is much relieved by the fortunate action of the House, but the relief is only temporary. It cannot be regarded as a substitute for a reduction of taxation and a stoppage of the inflow of money. The purchase of bonds at any fair price has its limits, and we must remember that many months must elapse before any tax-reduction bill can become effective, and that the surplus at the beginning of the present month was upwards of $104,000,000.

The "great divide," as the River and Harbor Appropriation Bill has long been called, came before the House on Monday. It calls for nearly twenty millions of dollars, and yet its promoters sought to put it through without debate under a suspension of the rules. They easily secured a majority, but happily failed by many votes of the necessary two-thirds, and the measure will now have to take its chances later in the session, after the Tariff Bill is disposed of. The worst feature of this matter is, that we seem to make no progress towards a satisfactory basis of operations as time passes. President Arthur's veto in 1882 of a bill appropriating nearly $19,000,000 called a temporary halt, but its influence is no longer felt, and apparently nothing short of another veto will check the wild extravagance of the logrollers.

The claim agents and demagogues at Washington have been chuckling over the theory that Mr. Cleveland would not dare to veto any of their pension schemes this year, in view of his probable candidacy for reëlection. The three vetoes of private pension bills sent in on Monday will open their eyes. Such a notification that Congressional measures will still be subjected to Executive scrutiny is as necessary as it is welcome.

The appointment by the President of Mr. Lovering as United States Marshal for Massachusetts is a victory for the spoilsmen of the Democratic party, which is the more notable because it is achieved in the State where Mr. Cleveland has in the past done most for the cause of civil-service reform. The term of the incumbent, Gen. Banks, expired some weeks ago, and ever since then a vigorous contest has been going on as to the succession. Gen. Banks had been so careless in his management of the office that he did not deserve reappointment, and the only question was as to what sort of a Democrat should be selected. An excellent representative of the progressive element was brought forward, and, on the other hand, Mr. Lovering, who has always been an open opponent of civil-service reform, and was nominated for Governor last fall at the instance of the odious Democratic ring in Boston because he was an unblushing spoilsman. The President hesitated long, but finally surrendered to the men who have been his bitterest enemies in everything that has been best in his career at Washington.

Mr. Lowell's address at Steinway Hall on Friday night, before one of the most intelligent and attentive audiences we have ever seen in New York, was a rare and impressive occasion. It has come to pass—why or wherefore we cannot stop to discuss here—that we have not just now a single man in public life who ever makes a speech on what we may call the philosophy of politics, as distinguished from practical questions of legislation, or whose utterances, if reported, are read with any care or interest by anybody, or remembered for one hour after they are read. In this respect the descent from the days of Clay, and Calhoun, and Webster, and Wright, and Everett, and Seward, and Sumner is tremendous. Mr. Lowell is, in truth, to-day almost the only American whose talk about politics, using the term in its best sense, is eagerly looked for, all over the English-speaking world, and put away in men's libraries beside the great masterpieces of thought and expression. The address to the Reform Club on Friday was worthy of him when at his best. It would have been difficult for any master of English this century has seen to have crowded into one hour and ten minutes so much apt historical reminiscence, so much shrewd observation, and so much acute analysis of the phenomena, both bad and good, of national life. What was better than all was, that there ran through every sentence a vein of that high morality and courageous hopefulness, and of that supreme confidence that, in the long run, the better cause will have the upper hand, which, to men who are worth much either to home or country, always sounds like a trumpet blast. Every one who listened to him, and, above all, those who have to deal with the unspeakable meannesses and trivialities of factional politics, must have been grateful for being raised even for one brief hour into the pure air and clear light which surround the things that ought to be.

Biddeford is a Maine manufacturing town whose foreign-born population, chiefly Irish and French Canadians, numbered more than a third of the whole number at the last census. A new city government was recently chosen, and the distribution of the "patronage" followed. As always happens in such cases, there was great dissatisfaction, but one peculiar element entered into the case, which was stated with the utmost frankness by an Alderman at a meeting of the City Council. "Fifteen thousand dollars," he said, "will be paid in salaries by the city this year, and how is that sum divided? The Irish get $725, the French $625, a total of $1,350 which the Catholics are paid, to $13,650 which the Protestants receive." He "arraigned" the Mayor for not exerting more of his influence to secure offices for his Catholic supporters, and complained that at

a final caucus he (the Alderman) had been ignored and "Americans got $325 in salaried offices, the French Canadians $110, and the Irish got left." All this seems very absurd, of course; yet what is it but the carrying out to its logical conclusion of what Mr. Lowell calls "the geographical allotment of patronage, as if ability were dependent, like wheat, upon the soil"? When Congress enacts that appointments to the Federal service shall be allotted among the States according to their respective populations, it is not strange that Biddeford Aldermen should insist upon dividing municipal offices according to race and church lines.

The operation of the Soldiers' Exemption Act in Massachusetts—the act which exempts veterans from competitive examination for appointments in the civil service—has been to reduce the number of veterans actually appointed about 75 per cent. The *Civil-Service Record* shows that under the law as it stood before the exemption was passed, forty-nine veterans were appointed to desirable positions during the preceding year. They then had, as they have always had, a preference among candidates who passed an equally good examination. During the six months since they were exempted from competitive examination only sixteen have received appointments, and all but four of these have been in the prison service, "where, owing to the small pay and the necessity of residence in the institution, it was impossible to get enough competitors to make an eligible list." The reason for this change in the fortunes of the veterans as applicants for appointments is, that the soldiers generally believe that the Civil-Service Law is broken down, and that appointments are to be secured now only by "influence." Consequently, fewer veterans apply for examination than formerly. Hence it comes to pass that only one soldier gets a position, and that a very undesirable one, where three or four were successful under the old law. Of course this was the result that the spoilsmen aimed at in the beginning. They wanted to whittle the law away by piecemeal, and to spread abroad the idea that the merit system was no longer in force. It was never any part of their plan to put soldiers in office.

The most significant feature of the Oregon Republican State Convention last week, like that of the Arkansas Convention the day before, was the character of the man who was put to the front as the representative of the party. In Arkansas it was the notorious carpet-bagger, "Pow" Clayton; in Oregon, it was George H. Williams, whose reputation as Grant's Attorney-General was so bad that the Senate would not confirm him as Chief Justice. As fourteen years have passed since that time, it is worth while to refresh the public memory by recalling the meeting of the Bar Association of this city, January 6, 1874, which resolved that it is the "deliberate conviction" of the Association that "the nomination by the Executive of George H. Williams to be the Chief Justice of the Supreme Court of the United States disappoints the just expectations of the legal profession, and does not deserve the approval of the people, for the reason that the candidate proposed is wanting in those qualifications of intellect, experience, and reputation which are indispensable to uphold the dignity of the highest national court, and to maintain general respect for the law in the person of the officer who presides over its administration."

The Iowa Legislature adjourned last week, and, as so often happens under such circumstances, the papers say that "the State feels greatly relieved." The feeling is more profound than usual, however, because the Iowa Legislature was an unusually dangerous body. The House of Representatives particularly was controlled by demagogues, who succeeded in rushing through it the most fantastic measures regarding the management of railroads. Fortunately the Senate proved what the national Senate has ceased to be—a check and balance-wheel—and, to quote the words of the leading Republican paper at the capital, "has resisted and defeated more wild and hoodlum legislation than ever had been proposed in any American State before." But the Senate was not able to defeat all the measures that ought to have been beaten. One of the worst that got through was a law making the Railroad Commissioners elective instead of appointive, and thus leaving the constitution of this most important body to be settled by the intrigues and trades of a political convention. A bill was passed prohibiting discriminations in freight charges, and requiring railroad companies to post schedules of their rates, which must not exceed a maximum fixed by the Commission. This is a measure of great importance, the working of which will depend largely upon the character of the men chosen as Railroad Commissioners.

Mr. Simon Sterne, in the last number of the *Financial Chronicle* of this city, advocates the plan propounded in the *Nation* as long ago as 1883 for placing legal restrictions on the striking power of certain classes of quasi-public employees, apropos of the telegraphers' strike then pending. We then said (July 19, 1883), after pointing out the important part played by the telegraph in the life of modern nations, and the immense loss caused by its sudden stoppage:

"Now, the question whether any body of men ought to be allowed for any purpose to inflict this loss and inconvenience on the public, is one of which the growing complexity of modern society will soon compel a peremptory settlement. A few years ago there was a strike of engine-drivers on one of the Massachusetts railroads, and they actually undertook to carry it out by abandoning trains filled with passengers in the open country, remote from a station. A repetition of this device was promptly prevented by penal legislation, so that every locomotive engineer in Massachusetts now holds his place with the understanding that if he abandons his engine on the road for any reason, he goes to jail. A similar theory of the relation of other railroad employees to the public led to the railroad strikes in 1877 and the horrible resulting riots, with enormous loss to the country. If anything of the kind were attempted again, assuredly some stringent measures for its prevention would be resorted to. The truth is that a society like ours, and like all commercial nations, has become so dependent on the post-office, the railroads, and the telegraph, that they may be said to stand to it in the relation of the nerves to the human body. The loss even for a week of any one of them means partial paralysis. The loss of all three would mean a total deprivation, for a longer or shorter period, of nearly everything which the community most values. It would mean a suspension of business and social relations equal to that caused by a hostile invasion, barring the terror and bloodshed. It is consequently something to which no country will long allow itself to remain exposed. It cannot allow strikes of employees in these great public services, any more than it can allow the corporations themselves to refuse to carry on their business as a means of extracting what they think fair rates of transportation. No Legislature would permit this, and one or two more experiences like the railroad strike will cause every Legislature to take measures against the other. Telegraphers, railroad men, post-office clerks, and policemen fill places in modern society very like that of soldiers. In fact, they together do for society what soldiers used to do. They enable every man to come and go freely on his lawful occasions, and transact his lawful business without let or hindrance."

Everything which has since happened in the matter of railroad strikes gives ample confirmation to this view. It is becoming plainer and plainer to every rational observer that the transportation service of the country cannot be carried on under the present mode of running railroads. There is, in fact, to anybody who knows anything of human nature and human affairs, something positively ludicrous in the present attempt to manage great armies of employees on extensive lines of traffic under the inspection of Powderlys and Arthurs. We recognize its absurdity in the case of the army and navy. If it were proposed that every military post or man-of-war should have a "General Worthy Foreman" to give advice to the soldiers or sailors when to refuse to do duty, and what conditions to make before obeying orders, the whole civilized world would indulge in a shout of laughter. It is not, however, necessary to go to the army or navy for an illustration of the absurdity of our present system. The merchant service suffices for the purpose. Sailors are not compelled to ship in any crew, but when they do, and sign articles, they have to do their duty to the end of the voyage. They are not allowed to strike. If they attempt to strike, it is called mutiny, and treated as a criminal offence which sends them to jail. In order to see the reasonableness of all this, one has only to suppose the engineers and firemen of an Atlantic steamer to announce to the captain, when two days out from New York, that they were "tired," and would work no more, or would only work long enough to carry the ship into Halifax; or the cook to announce that he would do no more cooking unless the steward or waiters were dismissed on the spot; or the sailors to say that, owing to the discovery of goods of a boycotted firm in the hold, they would neither reef, steer, nor look out during the remainder of the voyage. The immemorial law and custom of the sea will undoubtedly some day have to be applied to the work of transportation on land. Engineers and firemen and switchmen will have to enlist or sign articles agreeing to do certain duty, and obey

lawful orders for a certain period, under pains and penalties.

Mr. Chauncey Depew is reported in the Philadelphia *Press* as having stated that he "knew, of his own personal knowledge, where several Blaine Irish clubs disbanded in consequence of Mr. Burchard's alliterative remark, and went over to Cleveland." This is very interesting, if true, because it is the first time that any one has come forward in these three years, in spite of repeated challenges, to say either that he himself changed his vote in consequence of Burchard's remark, or knew of any one else who had done so. The nearest we have ever come to the fact, if fact it be, has been in hearing from some one that he knew some one else who "probably" or "doubtless" knew of somebody whom Burchard had driven away from Blaine. But here is Mr. Depew, who says that he knows, "of his own personal knowledge," not only of individuals, but "several clubs," who deserted Blaine in a body because they did not like what Burchard said. We trust Mr. Depew will, in the interest of historical truth, give us the names and locality of some of these clubs, so that the matter can be inquired into. We would not question his reports if we did not know, from his unfortunate experience about the Dutch tariff, that he is a trifle credulous in political matters. He allowed some unscrupulous Dutch "business man" to stuff him with a story last summer about ruinous changes in the Dutch tariff, or, as he called it, the passage of a "free-trade law," and not only never took the trouble to verify it, but repeated it to a reporter nine months later, as having some bearing on our present tariff controversy. We trust some impecunious "Irish club" has not been imposing on him in this case from sordid motives.

That the negroes are making substantial material progress is proved by the report of the Comptroller-General of Georgia, which shows that the amount of property upon which they paid taxes rose from five millions in 1879 to nine millions in 1887. This is an average increase of ten per cent. a year, whereas the property of the white people increased only five per cent. a year during the same period. It is noteworthy that the growing prosperity of the negroes in the South dates from the time when they ceased to depend upon the Government, and learned that the black man, like the white, has his own way to make in the world. One of the most hopeful signs for the race is the evidence that they have mastered this lesson which is found in the adoption, by a recent negro convention at Macon, Ga., of a common-sense resolution declaring that "this Convention regard the acquisition of a good English education, the accumulation of property, and the making and saving of money, the thing to do."

The way in which the Commissioners of Charities and Correction have removed "Fatty" Walsh from the Wardenship of the Tombs is almost as discreditable as his appointment. They have got rid of him by a preamble and resolution which might be used by the Professor of Logic of the College of the City of New York as an example of mixed fallacy and absurdity. Their argument is that inasmuch as Mr. Rhodes, the lawyer, now makes no charge against "Fatty" of an attempt to extort illegal fees, and as the illegal fees which Fatty did extort did not go into his own pocket, *therefore* the Board denies that bad language used by "Fatty" to Mr. Rhodes is a good cause of removal, and accepts his resignation. The meaning of this is, as far as we can make any meaning out of it, that the Board does not mind having the warden of a jail extort money from prisoners and lawyers as long as it cannot be traced directly to his own pocket, as if any "Fatty" of experience ever allowed unlawful gains to be traced directly to his own pocket; but it cannot abide "improper language used in the course of official business." This is irresistibly funny, in view of the fact that these very gentlemen, who are so particular about the speech of their subordinates, put in one of the most important places in their gift an old liquor-dealer, gambler, and pugilist and street rough, to whom the use of foul, profane, and abusive language is probably the most fixed habit of his life. The selection of a "Fatty" for a place requiring chaste and refined expression is about as droll as the selection of a brothel-keeper for the matronship of a reformatory would be. Our advice to the Commissioners is: "When you do these disgraceful things, do them boldly and frankly. If you think a 'Fatty' is fit to govern the jail of a Christian community, do not, after you have put him there, pretend to be disappointed or surprised by his bad behavior. Say frankly that this is just what you expected, and that you do not care five cents what anybody thinks about it."

The Anti-Poverty Society has retired from the Academy of Music, and will hold its meetings henceforth in Cooper Union. The reason given for the change is the necessity of finding a lower rental, the receipts being much less than heretofore, and the work of driving poverty from the face of the earth going on with correspondingly slackened pace. We doubt if the change will prove beneficial to the work. So long as the crusade against poverty was carried on in the Academy, it had an air of "style" about it which was a great incentive to contributions. The "ladies of the Society" were able to sit in boxes and listen to the attacks upon the Catholic Church which Dr. McGlynn made, and they were willing to pay as much for their seats as for the abuse which he poured forth so fluently; but now all the brilliancy has gone out of the meetings. There will be no boxes to sit in, and the musty flavor of McGlynn's harangues will not be lessened by being taken down in a cellar for weekly delivery. It really looks as if poverty would not be abolished this year after all.

The love of seeing other people fight valiantly for noble causes, which pervades the writing of a certain class of literary men with a taste for political philosophy, has been amusingly illustrated in the case of Kingsley, Froude, Carlyle, and Goldwin Smith, who are all fond of "making short work" of obnoxious people at home, and inflicting terrible slaughter on foreign enemies. Froude's delight over Rodney's victory in the West Indies, as compensation for the recent loss of a great empire through gross misgovernment, furnishes one of the most diverting passages in his book on the West Indies. It ought to be read in connection with the comments of Franklin on the same event, in order to see the difference between a real statesman and man of affairs, and a babbling rhetorician who gets his military experiences over a quire of paper and a bottle of ink. This *furor bellicosus* seems in these latter days, as we have more than once pointed out, to have reached some of the scientific men, of whom poor Prof. Tyndall is a fair sample. The thunders against Gladstone which the Professor discharged from the Alps all summer were among the most diverting incidents of the Irish trouble, particularly when he denounced Gladstone for his attacks on the Orangemen, among whom he (the Professor) had "first learned to read his Bible." Now, however, he has apparently reached the conclusion that persuasion is wasted on this wicked old man, and he brings to his notice, by way of warning, the saying of the other sage, Thomas Carlyle, that "A minister who is wicked enough to propose to sever Ireland from England, deserves to have his head brought to the block."

The new tariff on wheat in Germany is equal to $1.19 per 220 pounds, or 30 per cent. ad valorem. The object of it is to exclude American wheat from South Germany, and to compel Bavaria, Baden, and the Rhine country to buy Prussian wheat exclusively. But it is much cheaper to supply the South German people with American wheat from London. Moreover, the South Germans are accustomed to American wheat; they even like it better than Prussian wheat. On the other hand, Prussian wheat is very conveniently situated for the English market, and very inconveniently for the South German market. Accordingly, a bill has been introduced in the Reichstag to enable North German merchants to export wheat to England, and to import an equivalent amount of American wheat to South Germany free of duty. In order to make the swap easy and frictionless, it is proposed that the exporter of North German wheat shall have the right to sell his permits of importation just as he would sell a bill of exchange. The drollery of all this circumlocution, by which the consumer is sacrificed to the producer, has not penetrated the German mind to any great extent, but there is much suffering in South Germany in consequence of the deprivation of American supplies of food. Why do not some of our high-tariff men, who are such fast friends of the American farmer, propose a measure of retaliation?

WOOL AND MUTTON.

Mr. William Lawrence of Ohio, a great authority among wool-growers, has written a letter to the Boston *Commercial Bulletin* to show that what this country wants in order to achieve great prosperity is the very highest tariff on wool that anybody can imagine. Even the tariff of 1867 was not high enough for him. He allows this, indeed, to have been a great and glorious tariff, and even announces the very startling discovery that "sheep-growing as a distinct industry did not begin to acquire great importance until after the wool tariff of March 2, 1867." He neglects to add, what has been a thousand times proved by official statistics, that sheep-growing as a branch of general husbandry began from that very year to decline, so that in ten years the sheep on farms devoted in large part to other crops had shrunk to half their former numbers. Reiteration and reference to official documents on this point seem to have no other effect on the victim of the wool-tariff mania than to cause him to reiterate his historic falsehoods with increased confidence and excitement.

But Mr. Lawrence has a grievance against that tariff. He says: "The act of 1867, however, discriminated in favor of the importation of the long wools of the Cotswold and Down sheep, and, in practical effect, admitted them at a less rate of duty than the clothing wools. The duty was less, because, though that act imposed the same rate of duty on unwashed combing and clothing wools, yet it admitted *washed* combing wool at the same rate of duty as *unwashed*, though on washed clothing [merino] wools the duty was double that on unwashed." And he has nothing to say of the terrible tariff of 1883 except that it "continued the same discrimination."

Now we come to Mr. Lawrence's humor. It is of a rare and racy vintage. The arguments are not rare by any means, but the grouping is irresistible, for the simple reason that it is close and honest, and leaves the harmony and inharmony to manifest themselves in their own full and exuberant force. Thus:

> "We now import annually the long combing wools to the amount of about 5,000,000 pounds, mostly produced in England and Ireland. If Congress would insert in the tariff law six words—'on washed combing wool double duty'—the result would be (1) that in five years or less the long-wool sheep would be increased 20,000,000; (2) we would not import one pound of foreign long-combing wool; (3) we would produce in this country all of such wool we need; (4) the price would be 30 per cent. less than it is now; (5) the wool manufacturers would secure cheaper combing wool; (6) those who consume delaines and other goods made of such wools would procure them 30 per cent. cheaper than now; (7) farmers would raise comparatively fewer cattle than now, but they would produce mutton from Cotswold and Southdown sheep which would more than supply their place; (8) they would make more money in raising such sheep than from cattle, because, in addition to the mutton, wool would afford profit; and (9) the cities, the manufacturing districts, the whole people, would have a greater abundance of cheaper, more healthful, and better meat food than now."

From which it appears that by stopping the importation of 5,000,000 pounds per annum of long wool we shall make a market for the fleeces of 20,000,000 long-wooled sheep. That is to say, each average fleece of long wool weighs a quarter of a pound. It would seem that if the staple is really very long, it must be remarkably thin on the sheep's back.

It appears, too, that the farmers who are to own these 20,000,000 long-woolled yet thinly clad sheep are to sell both wool and mutton a great deal cheaper than they now do, and yet make a profit on the investment which all their close economy and hard work in rearing and shearing, and all the mathematical resources gained at the public schools, fail them now to figure out.

There may be some force in the prediction that an increase in the wool tariff would cheapen mutton. Whatever may have been the cause, mutton was never so cheap in this country, compared with other meats, as in the years following the enactment of the wool tariff of 1867. It was in many of the central wool-growing States a drug in the market. In their mad haste to get rid of the sheep which had just been taken under the Government's protection, the farmers sold what they could to the ranchmen, and then turned to the butchers. Those persons who liked it feasted and surfeited on the "wholesome food." But the trouble is that a great many people cannot eat it. Hence the mutton market is limited and more easily glutted than that of other meats.

Within the limit thus fixed, the long-woolled mutton sheep pay the best now, in the Western States, and the wool-growers are turning their attention that way. "Breed for mutton, and let the wool take care of itself," is the maxim laid down by a practical grower of long-woolled sheep, in the *Iowa Homestead* for April 6, and he adds that "Recent low prices have tended to increase its use, and there is reason to believe that mutton may yet rank alongside of beef." He is apparently unconscious of the fact, stated by Mr. Lawrence, that the long-woolled mutton sheep have less "protection" than the merinos—another illustration of the rule that the more protection sheep have, the worse they thrive and the less they pay.

Since 1824 the American people have tried every possible experiment in the way of clothing themselves with wool and feeding themselves with mutton, except the simple one of letting each man pay for his wool and his clothing and his mutton exactly what they are worth, without bonus, bounty, or subsidy to any other man. All the experiments have been unsatisfactory. Even that of 1867, which the wool-growers and manufacturers united in asking, Mr. Lawrence now tells us was a mistake. If all these experiments, running through half a century, have turned out badly, would it not be philosophical to try the other one, and see what the effect would be of putting the production and consumption of wool and mutton on the same basis as that of hides and beef? The ancient Egyptians considered the ox a more sacred animal than the sheep. We have followed the opposite superstition, and have regarded the sheep as the only domestic animal worthy of veneration. Let us put them on an equality for once, and see what the effect will be upon the industry and morals of the community.

LONG AND SHORT HAUL IN ENGLAND.

The contest over the Railway and Canal Traffic Bill in England is, in some respects, not unlike that over the Inter-State Commerce Law in America a year ago. The bill, as framed by the Government, contained a clause substantially like our own short-haul clause in its effects; that is to say, it threw upon the railroad companies the necessity of proving special circumstances and conditions if they wished to maintain their present local discriminations. The representatives of the agricultural interests went further, and wished to make a hard-and-fast prohibition to which there should be no exceptions. They have succeeded in carrying an amendment to that effect in the House of Lords.

The case generally comes up in forms like this. American meat can be shipped either from New York to London by direct steamer, or from New York to Liverpool or Glasgow, and thence by rail to London. But in order to secure any share of this traffic, the railroads have to content themselves with very low rates—no higher, in fact, than the difference between the current steamship rates from American ports to London, and those for which steamships are willing to carry the same article to Liverpool or Glasgow. This leaves the railroad companies a very narrow margin. To secure this foreign business, they are obliged to make rates which would be ruinous if applied to their whole business. The same principles hold good in their trade with France. If French hops can be brought to London by direct steamer, the railroad from Folkestone to London can charge only the *difference* between the steamship rates from France to London and from France to Folkestone. The consequence has been that French hops were charged very much less from Folkestone to London than English hops had to pay from intermediate points.

These are cases where discrimination would not be prohibited by the American law, as interpreted by the Commission. The lower through rate is justified, and, in one sense at least, rendered necessary, by water competition. But there are several reasons why English shippers would not be ready to accept such an interpretation of the law. In the first place, it would make it almost a dead letter; at any rate, it would limit its application much more than it does with us. Two-fifths of the stations in England are affected by water competition, and it is probable that ninety-nine-one-hundredths of the local preferences are more or less directly due to that cause. A statute which could not reach these cases would fail of the object for which it was designed. Secondly, these preferences in favor of markets which can be reached by water are specially obnoxious to the English shippers, because they seem expressly designed to favor the foreign producer. If the Scotch cattle-raiser has to pay twice as much as his American competitor for precisely the same service, he can make a strong appeal for legislative aid on

grounds of national feeling. "Not merely has the home producer no protection," he can say, "but the railroads are allowed to give the foreigner a virtual bounty, by doing the same service for him at lower rates than they will for us." As an appeal to the sentiment of Parliament, this argument has much force; but it is still more important as appealing pretty directly to the pockets of many members of the House of Lords. Depending as they do upon their rents for so much of their income, they cannot be expected to acquiesce in a system of railroad charges which will have the effect of reducing agricultural land values. This is the reason why the House of Lords is disposed to deal with this matter more severely than the House of Commons. The English peer is dependent upon his land values as much as the Iowa farmer, and each hopes that strict railroad regulation may be the means of bettering his condition.

There is one other respect in which the English railroads are less favorably situated than ours for resisting legislation of this kind. The community has less to fear from the indirect results of its own action. In America, if anything interferes with railroad profits, it checks railroad building. The people who have passed the laws, find that they suffer so much from loss of facilities that it more than offsets what they gain by lower rates; and the stringent part of the law is either repealed or allowed to fall into "innocuous desuetude." But the English roads have no such defence. England's railroad system has been virtually complete for many years past. The roads are sure of a considerable amount of paying business, law or no law. If the statute should have the effect of reducing dividends, the stockholders would grumble; but no law is likely to be overthrown by grumbling, even when the grumbler carries his art to that pitch which the English capitalist has attained.

All things considered, it looks as though England would soon have a statute more stringent than our own Inter-State Commerce Act. Whether it will be successfully enforced is another question. A sweeping measure of this kind is apt to leave room for technical exceptions, of which the railroad companies will be sure to take advantage to the very utmost. If such a law is passed, we do not envy the first shippers who try to secure their rights under it.

THE "SPOILS" IN FRANCE.

It is impossible to blame the French voters who have just given Boulanger such a sweeping majority for being very much disgusted with the existing régime. The Chambers have been going steadily from bad to worse. They do nothing but form and reform combinations for the overthrow of successive ministries, in full view of the fact that the quality of the men who consent to take office under them is steadily declining, that all healthy legislation has thus been made impossible, and that it is with the greatest difficulty that the appropriations necessary for the maintenance of the Government and the support of the public credit are secured.

During the last six months, too, they have added a new horror to the situation by introducing the practice of expelling the President of the republic from office before the end of his term, by boycotting him, or, in other words, by refusing to form a Cabinet for him. Of course there was an appearance of excuse for this in the fact that the President's son-in-law had opened a sort of office for jobbing Government patronage and decorations in the Presidential mansion; but the truth was that he simply did on a great scale what the bulk of the Deputies and Senators were doing on a small one, and this brings us to the root of the trouble, which is neither more nor less than "spoils." The French republic is today threatened with a military dictatorship simply because there are not "offices enough to go round," as our phrase is; or, in other words, because the attempt to secure parliamentary majorities by means of executive patronage has been tried and has failed miserably.

If we had tried the same experiment—that is, if the President had been obliged to choose his Cabinet from Congress in the English fashion, and the members of it had been made responsible to Congress, and had been compelled to resign under adverse votes of either house—the breakdown of the system in this country would have been as complete as it has been in France. It is not the superior virtue or capacity of our legislators which has saved us, but the assured independence of the Executive. For the disease which is destroying free government in France is as virulent here in the political class as it is there, but is kept under by the fortunate circumstances of the country. In fact, the love of "spoils" seems to be the disease of modern democracy, the ravages of which are felt everywhere, like the old leprosy of the East, though in some places less than others. Our Executive is constantly urged, and in some degree successfully urged, to do what the French Executive has tried to do, and failed, viz., create majorities for the Government by the distribution of patronage among the members. The pressure on our Executive has not been so great as that on the French Executive, because it is not placed in the power of the Legislature in the same degree as the French Executive; but the pressure exists, is as constant as in France, and exercises fully as corrupting and degrading an influence on the political class.

The best political observers in France have, for fully ten years — that is, ever since the Republicans got fairly into power—foreseen clearly the collapse which we are witnessing to-day. They knew well that the practice of trying to make majorities by distributing offices must, sooner or later, break down through the impossibility of providing enough offices to satisfy all claimants. The crisis has been postponed through a steady increase in the number of Government places, which has now become so great that a recent writer has observed, jestingly, that all France will soon be in the Government service, so that there will be nobody left to provide salaries for the officials. But it had to come, sooner or later, and, as in all political crises in France, the remedy appears not in the shape of an agitation for the reform of the civil service, but in that of a man on horseback with big spurs and a sabre.

The French experience is exactly like our own. When we give an office to one man to satisfy "claims," we disappoint ten others who think their claims are just as good as his. When the supply of offices gives out, the pressure of the unsatisfied claimants continues as strong as ever, and if an increase of places be impossible, "rotation" has to be resorted to—that is, the ins have to be dismissed to give the outs a turn at the public crib. Every one of these changes makes ten men discontented for the one whom it makes happy, and, what is still worse, it not only presents "politics" in the shape of a lottery full of small prizes to tens of thousands of the young, the shiftless, the unfortunate, but it diffuses through the industrious, the sober-minded, and the frugal a profound distrust of and disgust with the machinery of government.

We are more happily situated than the French. We have a better constitution, and we have what is, perhaps, better than the best constitution—strong political traditions, and a deeply rooted habit of government by persuasion. But the "spoils disease" is one which no political constitution can in the long run resist, any more than a physical constitution can in the long run resist incessant dram-drinking. Cocktails tell on some livers and kidneys much earlier than on others, but they tell on all sooner or later. Successful government by spoils is, in the present state of human nature, not possible for an indefinite period by any branch of the human family. Those who are most troubled by the difficulties which our immense accretions of untrained foreigners are introducing into our industrial life would do well to consider what the effect on them of open and undisguised government by bribery—for office-jobbing is simply bribery with the public money—is likely to be when they become fully acquainted with the possibilities which American politics opens up to men to whom politics is business, and who occupy themselves with public affairs as they would with pork-packing or coal mining—for revenue only.

MATTHEW ARNOLD.

Mr. Matthew Arnold's sudden death on Sunday will be a painful surprise to the whole English-speaking world. There was probably no name in current English literature better known to the present generation than his. When he made his first appearance, years ago, he had the advantage of being the son of a father who had been admired and respected as few Englishmen of this century had been, and he very speedily established claims of his own to distinction of a widely different sort. His father was a very orthodox Churchman—so

much so that he found it impossible to receive Unitarian pupils as such at Rugby, and he was haunted all his life long with the dream of a Church establishment which should really and truly include and be the State.

Matthew Arnold speedily cast off these traditions. He made his début in the world of letters as a poet, and it is as a poet if at all that he achieved enduring fame. But he is best known to the world at large as the apostle of pure criticism. Thousands have read his 'Culture and Anarchy' and 'Literature and Dogma' for ten who are familiar with his poems. His attacks on British Philistinism in Church and State were, in fact, the delight of the reading world twenty years ago, both from their audacity and the attractiveness of their style. It was a style with many tricks and catchwords, and considerably clarified by iteration, but it had a charm of its own from which very few at first, before it had become too familiar, could escape. No living author has, in truth, furnished a greater number of "familiar quotations" to the mob of writers and orators. His "sweetness and light," and "stream of tendency," and "something not ourselves that makes for righteousness," and his classifications of Hebrews, and Hellenists, and Philistines, are now so trite that we find it difficult to realize that twenty-five years ago nobody knew anything about them. His plan of literary construction was, in fact, that of the preacher. He was apt to take a text from some author, sacred or profane, as the key-note of his composition, and bring the reader back to it at frequent intervals, or flash it like a lantern every now and then on the dark places of his thesis. The tone of all his essays is essentially a pulpit tone. He preaches salvation, if not from eternal damnation, from vulgarity, from dulness, from gross tastes and gross pleasures, from ignorance, and blindness to the true joys of life.

What brought him most of his popularity as an essayist and social philosopher was undoubtedly his opportuneness. He appeared just as John Stuart Mill, Darwin, Tyndall, and Huxley had taken hold of the young men, and destroyed their interest in the theological discussions which perturbed the previous generation, without furnishing them with anything very solid in the nature of a solution of the moral problem of the universe. To tens of thousands who could not worship science, and had but a poor head for facts of any kind, and yet felt that they must give up their old religious belief, it seemed for a moment as if Arnold had hit on a way of providing something which would take the place of a creed, and cultivate the faculty of reverence, and keep alive the faith in the final triumph of righteousness. Not the least recommendation of his gospel—if gospel it could be called—was that it seemed especially intended for university men, and what may be called the world of culture. In fact, it made the work of grace just a little difficult in anybody whose educational opportunities had been at all limited.

In recent years Mr. Arnold has written a great deal on political questions, but it cannot be said that his excursions in this field were happy or successful. He was wanting in the faculty known as the political sense, the sense of the practicable, without which no man can philosophize on questions of government with any advantage to himself or others. He, therefore, always appeared in an unfavorable light when he came down from the upper air of social and religious speculation in which he usually dwelt, to criticise the politicians and politics of his time. His coming to America, too, as a lecturer was a mistake, and added nothing to his fame. He had no preparation for that sort of work, and was evidently very ignorant of the special needs of the audiences for which he sought, and very ill fitted to encounter the sort of treatment which American newspapers deal out to literary and scientific men who do not please their taste—something which he confesses somewhat pathetically in that last article of his on American civilization which has attracted so much attention in this country. But, even after setting apart his fame as a poet, which will last as long as the English language endures, it must be admitted that he has done some work as a preacher the effects of which are already felt by many who have never read his essays, and will probably continue to be felt long after the essays have ceased to be read. He had no disciples, and probably nobody could be found who ever attempted to live by him or under him; but he did undoubtedly, in many minds, although imperceptibly, exalt the duty of "seeing clear and thinking straight," and help many towards higher pleasures than those of the senses, and foster that interest in "the things of the spirit" which the very triumphs of the modern world tend to abate or extinguish. He was, in short, a man who, however slight the mark he may have left on the outward course of human affairs, has done well for his day and generation, in helping to keep alive the faith of the race in the nobler possibilities of human existence.

THE MUTATIONS OF THE INTERNATIONAL COPYRIGHT BILL.

THERE have been no less than five official prints of the "Chace" Copyright Bill, besides three unofficial texts, the latter being of interest and value in attempting to trace the various changes which have been proposed and accepted. To comprehend rightly these important alterations, it is necessary to know the contents of the original bill, as it was presented to the Senate January 21, 1886. This bill, numbered S. 1178, is four pages in length, notwithstanding that two of its paragraphs (containing but thirty-five words) are virtually sufficient to extend to foreign writers the protection now enjoyed by native authors. But this length is necessary (1) to express the special requisitions demanded of the foreign author in order that he may obtain a copyright, and (2) to set out certain restrictions put upon such copyright in his case. The present copyright law is extended to include the works of foreign authors by expunging from the Revised Statutes such qualifying words as "citizen of the United States or resident therein," and by repealing the section (4971) which legalizes the present disgraceful piracy of works of literature and art. This much of the original bill has remained unchanged (with the exception of some slight verbal alterations) in every subsequent print.

The remaining provisions, briefly set out and, for convenience, arbitrarily numbered, are: (1.) The right reserved to authors by the present law, to dramatize or translate their own works, is limited to apply only to such works as have been copyrighted in the United States. (2.) The prohibition of the importation of surreptitious copies of books, maps, and works of art contained in sections 4964 and 4965 of the Revised Statutes is erased, it being supposed, apparently, that such non-importation is provided for in another section of the bill. (3.) The author or artist who is "not a citizen of the United States or a resident therein," must send to the Librarian of Congress a printed copy of the title of his book or other article, and secure the registration of the same not later than fifteen days subsequent to publication in the country of origin. (4.) Two copies of the "best American edition" of the author's book must be deposited with the same officer, within three months after the date of recording the title above. (5.) In default of such deposit the "copyright shall be held void and of no effect," which is also to be the case (6) if the American publisher, after having printed a foreign book, subsequently abandons its publication. (7.) From the time the copyright of a book is recorded, and during its existence, the importation of the book is prohibited, and (8) officers of customs and postmasters are required to seize and detain all copies of any foreign edition which may be entered at the Custom-house or transmitted to the mails of the United States; and the Secretary of the Treasury and the Postmaster-General are empowered to make and enforce regulations to prevent such importation. In order that it may be known what books are subject to seizure, it is required of the foreign author (9) that he shall pay one dollar for having his title recorded (double the amount now charged the native author for the same service), this sum to go to defray the expenses of lists of copyrighted articles to be printed each week and distributed to collectors of customs and postmasters, and also to such other persons as may desire them at a cost of not more than $5 per annum. (10.) These lists are to contain, also, "the titles or descriptions of all articles on which copyright shall have expired or become void" (*vide* "5" and "6"), presumably in order to acquaint the above officers with the titles of books which may thereafter be allowed to be imported. (11.) The Librarian of Congress is to prepare the material for the above lists, and (12) is to receive for that service an addition of $1,000 per annum to his salary. (13.) The non-importation clause is not to apply, however, to non-copyrighted foreign books of which translations into English are copyrighted, but only to such translations. (14.) Each volume of a book when published separately, and each number of a periodical, is to be considered an independent publication; and (15) new editions of works heretofore published, containing alterations and additions, are to be deemed capable of being copyrighted. The first, ninth, and eleventh stipulations, relating to the reservation of the right to translate and dramatize, the payment of a fee of $1 for entry of title, and the preparation and distribution of lists of copyright articles, have not been changed in any subsequent issue of the bill.

When presented to the Senate, the bill was referred to the Committee on Patents, and during January and February, 1886, this Committee held various hearings in order to consider the views of the different people whose interests were affected. The result was an amended bill, favorably reported May 21, 1886, and numbered S. 2496, in which the

sixth stipulation enumerated above, the voiding of the author's copyright through abandonment by the publisher, is omitted, and the twelfth provision is changed so as to authorize the Librarian of Congress to employ an additional clerk at $1,200 per year; which two amendments have been included in all later prints of the bill. The foreign author, instead of being allowed fifteen days in which to secure the recording of his title, is required to record it not later than the day of publication abroad; and the words "best American edition" in the fourth stipulation are emphasized to "best edition printed in the United States." The important changes, however, occur in the fourteenth provision, where an amendment renders it impossible to obtain a copyright upon the volume or volumes of any work issued subsequent to the time when the bill becomes law, if the first volume has been published previous to that date; and in the fifteenth, altered so as to prohibit the obtaining of copyright upon new editions of works which form part of any series that was in course of publication when the act went into effect. These serious limitations upon the protection which the bill purports to secure to the works of foreign authors still remain a part of the final text of the bill.

As the Forty-ninth Congress took no determinative action upon the Copyright Bill, it was presented anew in the first session of the Fiftieth Congress, December 12, 1887, and again referred to the Committee on Patents. This third print (numbered S. 554) contained no alterations of importance. The date of enforcement, however, is advanced one year to July 1, 1888.

Shortly after this second introduction of the bill the American Publishers' Copyright League was organized with a view to coöperation with the Authors' Copyright League already established. The result of various conferences between these two associations was set out in an unofficial fourth edition of the bill (which may be designated as 554b), printed for the purpose of suggesting certain amendments to Senator Chace and securing his consent to them, as well as the approval of the representatives of the interests of Philadelphia. It is suggested in this proposed bill, that the prohibition of importation of unauthorized copies, repealed in the original bill, be reinstated according to section 4964 of the Revised Statutes, and that the penalty imposed in that section upon unauthorized reprinting, publishing, or importation, be also attached to unauthorized dramatization or translation. The third provision, concerning the recording of the title of works by an author not a citizen, is altered to require simply the *delivery* to the Librarian of Congress, or the deposit in the mails within the United States, of the title of a book or description of other articles intended to be copyrighted, and the interval of three months allowed for the deposit of the two copies of a book is done away with by the requirement of such deposit "not later than the day of its publication in the country of its origin." By this alteration, which secured simultaneous deposit of a title-page and copies of a book, the tenth provision (requiring the lists prepared for the use of collectors of customs and postmasters to include the titles of books on which the copyright had become void through a failure to make such a deposit of copies within three months after the delivery of title-page), was rendered nugatory, and that provision ought, therefore, to have been stricken out, but, by oversight, it was allowed to remain, not only in this print, but in every subsequent print except the last. The important amendment suggested in this issue of the bill is the modification of the absolute prohibition of importation to a stipulation of non-importation "unless the consent of the proprietor of such copyright shall first have been obtained in writing, signed in the presence of two or more witnesses," and limiting, accordingly, the seizure of copies to such as are imported without this consent.

But the various alterations suggested failed to receive the concurrence of the Philadelphians, though it is understood that Senator Chace endorsed them; consequently, after another conference held February 3, a fifth print (554c) was made containing further modifications. The thirteenth provision of the original bill, which had been uselessly reworded in the previous print, is now stated in the following concise and intelligent language: "In the case of books in foreign languages, of which translations in English only are copyrighted, the prohibition of importation shall apply only to the translation of the same, and the importation of the books in the original language shall be permitted." The non-importation provision is again modified, or rather extended, importation being prohibited except in the cases specified in section 2505 of the Revised Statutes, and except in the case of "persons purchasing for use and not for sale, who import not more than two copies at any one time." Section 2505 (the free list) allows the importation of books printed twenty years, books, maps, and charts for the use of the United States or for the Library of Congress, or two copies in one invoice, in good faith, for the use of any philosophical, literary, or religious society, or for any society for the encouragement of the fine arts, or for any college, academy, school, or seminary; also, professional books of persons coming into the United States, or books which such persons have purchased abroad for their own use not less than a year previous to arrival. "In each of which cases," however, according to the bill, "the written consent of the proprietor of the copyright, signed in the presence of two witnesses, shall be furnished with each importation." The eighth provision, also, is extended so as to authorize the searching of the belongings of persons arriving in the United States for books not authorized to be imported, and when such are discovered they are to be destroyed instead of being detained as previously provided for. This carefully hedged provision as to importation has been accepted by all parties conferred with, and is incorporated in the final text of the bill.

The provisions numbered "3" and "4" had appeared in the previous editions of the bill as a proviso to section 4956 of the Revised Statutes, but in this print that section is entirely reworded, with resulting important modifications, not only of the original bill, but of the present domestic copyright law, affecting not only the foreign authors but also native authors, artists, and publishers. (1.) The stipulation of the previous print requiring the deposit of copies "not later than the day of publication," is extended to works published originally in the United States; whereas by the present law such deposit of American books is allowed to be made "within ten days from publication thereof." (2.) While the requirement that copies for deposit should be "printed within the United States," had been, in all previous prints of the bill, confined to *books*, the wording is now changed to "book or other article," thereby including maps, charts, dramatic or musical compositions, engravings, and prints, and thus extending the stipulation which had previously been applied only to the works of authors, to the productions of artists as well. (3.) This stipulation of American manufacture, which before had been imposed only upon persons who were not citizens of the United States, is now made a condition binding on any one claiming a copyright, so that our native authors and artists are required to give up the privilege, which is theirs by the present law, of having their books, maps, or engravings made abroad if they choose (provided, of course, that they submit to the extortion of one-fourth of the value of their property by the tariff tax), and are compelled to print their works in the United States or forfeit their copyright entirely.

These important concessions having been agreed to upon the part of the authors and publishers (the artists do not seem to have been consulted), an effort was made to secure for the text suggested the adhesion of the typographers. But only the typographical unions of Cambridge would agree to support the bill, those of New York hesitating, and the unions of Philadelphia refusing. The result was yet another edition of the bill (554d), embodying the "typographical amendment"—the only alteration in the text of the bill—which requires that the "two copies of such copyright book or other article" deposited shall be "printed from type set within the limits of the United States." It was this text of the bill which was submitted for consideration at the hearing on March 9, and which the Committee on Patents were urged, with but a single dissentient voice, to report favorably to the Senate.

On March 19 Senator Chace reported an amended bill, which was renumbered S. 554, and which consisted of the text of the print "554d" engrafted upon his original bill, with amendments limiting the prohibition of importation to the term of the copyright, and extending the prohibition of unauthorized dramatization or translations to section 4965 of the Revised Statutes, where it can only apply, if at all, to musical compositions, the remaining part of the section referring only to works of art. The House print of this edition of the bill, numbered H. R. 8715, is the same text freed from typographical errors, and this last print may be accepted as the final text of the "Chace" copyright bill.

FERRY'S BALZAC.

PARIS, April 5, 1888.

ALL great men have had their witnesses who have made us familiar with the incidents of their lives. Very ordinary writers sometimes, and ordinary men, these witnesses render, nevertheless, a great service to literature. M. Gabriel Ferry has been one of these followers of famous people, and has published a book on Alexander Dumas, the father. He has just now given us another under the title of 'Balzac et ses amies.' Nothing that concerns the great author of the "Comédie humaine" is unimportant, and we have found some valuable documents in this volume concerning what may be called the genesis of his work.

Balzac was born in Tours on May 16, 1799. He made very good progress at the College of Vendôme, and afterwards began his law studies in Paris. His father was a very positive, serious man, who had been for a long time employed by the great army contractors. He preserved in his dress the fashions of the Directory, took great care of his person, and had calculated that by such care he could live a hundred years (he died by accident in 1829, at the age of eighty-three). He wished to make a notary of his son, and placed him in a notary's

office. Young Balzac had no taste for the law; he had literary tastes. He begged to be allowed to try a literary career for two years. The father consented with reluctance, and Balzac took possession of a room in the Rue Lesdiguières, No. 9, which his mother had chosen for him. He was now free. His family lived in a little country house at Villeparisis; he himself was in the great capital, and in his little garret he began, alas! a tragedy. His subject was Cromwell. "I have chosen the subject of Cromwell," he writes to his sister Laura (September 6, 1819), "because it is the finest in modern history." He worked at it during a whole winter, without other distractions than a few visits to the Jardin des Plantes. In April, 1820, the classical five acts were ended; Balzac read his tragedy before a sort of family council at Villeparisis. The final arbiter was to be a friend of his father, an ex-professor of the Polytechnic School. When the reading was over, the old professor declared solemnly that the author would do well to devote himself to anything he liked except to literature.

The young author was not too much discouraged; he abandoned the tragic muse, and began to write novels. It must be remembered that in 1821 the novel had not become, as it is now, one of the necessities of life. The First Empire had only known the sentimentalities of Mme. Collin; 'Anatole,' a novel by Mme. Sophie Gay, which would now be found unreadable, had given an hour's distraction to Napoleon at Fontainebleau the night before the famous day when he made his adieus to his Guard. The novels of that period are almost childish; under the Restoration, the Vicomte d'Arlincourt wrote a few novels, which are as ridiculous in style as in sentiment. The romantic movement was beginning when Balzac began to write. He composed in 1822 'L'Héritière de Birague,' 'Le Vicaire des Ardennes,' and some stories now quite forgotten. He signed himself "Horace de Saint-Aubin," "Lord R'hoone," etc. It may be said that in these first essays Balzac simply learned to write; he had not yet received those inspirations which afterwards revealed to him his own genius.

The first inspirer seems to have been a woman, Mme. de Berny, who lived with her husband at Villeparisis. She was a few years older than Balzac, and her physical and moral personality was afterwards to be found in the original and touching type of Mme. de Morsauf in the 'Lys dans la Vallée.' M. de Berny was much older than his wife, impatient, irascible, bad-tempered, selfish; Mme. de Berny was mild and submissive. Her almost maternal friendship was of great use to Balzac; she was to him for a long time a sort of Egeria. Balzac had an exalted affection for her; he wrote: "I was very unhappy in my youth, but Mme. de Berny repaid all with her absolute devotion. . . . I was, indeed, spoiled by this admirable woman." In a letter of 1836, he calls her an angel. When Balzac's parents had sold their little property at Villeparisis, Mme. de Berny had also left the place; she lived in Paris in winter, in summer at St.-Rémy in the department of the Oise. Balzac made many visits to St.-Remy; he wrote there the 'Célibataires' and the 'Curé de Tours.'

Mme. de Berny died in 1836, while Balzac was in Italy. He wrote, on hearing of her death:

"The person I have lost was more than a mother, more than a friend, more than any human creature can be to another. She strengthened me by her words, her actions, her devotion during great trials. If I live it is through her—she was everything to me. Though, for the past two years, sickness and time kept us apart, we were visible to each other; she reacted on me, she was my moral sun. Mme. de Morsauf, of the 'Lys dans la Vallée,' is a pale expression of the least qualities of this person. It is a distant view, for I have a horror of prostituting my own emotions to the public, and of what happens to me nothing will ever be known."

It is somewhat strange that, after such a strong expression of Balzac's sentiments, M. Gabriel Ferry should write in this vein: "Between Balzac and Mme. de Berny did friendship always remain Platonic? This idealism of sentiment is doubtful; evidently, the affection between this young and ardent man and this agreeable woman became love." Such was the delicacy of Balzac on the subject of his affections that Théophile Gautier, alluding to Mme. de Berny, says: "In the course of our intimacy, which lasted from 1836 till his death, Balzac only once spoke to me, in the most tender terms, of an attachment of his early youth, and he even only gave the Christian name of the person, the recollection of whom still, after so many years, brought the tears to his eyes."

Very different from Mme. de Berny was Sophie Gay. She had a salon; she belonged to the society of the Directory and of the Empire, and received the Liberals under the Restoration—Béranger, Benjamin Constant. Her daughter, the beautiful Delphine, recited verses in favor of the Greeks; everybody at that time was Philhellenic. Mme. Gay never had much influence on Balzac; she merely treated him as one of her lions when he became famous.

Celebrity did not arrive in a day. Balzac's father still wished him to go into some business, and in order to please his parent he tried a speculation—he became a publisher, issuing the works of Molière and La Fontaine in compact volumes. He bought a printing-office, and afterwards a type foundry. All his calculations were wrong, and he was on the point of becoming a bankrupt. He sold his establishment, and found that he still had a debt of 120,000 francs. This debt was the great trouble of his life, for he undertook to pay it off by his writings. Pending liquidation he went to Fougères, in Brittany, and wrote the 'Chouans,' one of the most extraordinary of his novels, and the first of his works which he signed with his own name. His life became a struggle for money: he threw himself upon every subject. After 'Catherine de Médicis,' a poor historical study, he wrote his 'Physiology of Marriage,' and the first 'Scènes de la vie privée.' He contributed articles to a number of reviews. "What is life?" said he to a friend who begged him to take some repose; "life is courage."

In 1830 he was able to take a little house during the summer in Touraine, on the Loire, and there he composed the 'Peau de Chagrin,' the book which gave him entrance to the Olympus of literature—a marvellous book, full of the most profound philosophy, illustrating the vanity of all human desires, and describing the malady of our time—the malady of wealth, of money. "No novelist," justly says M. Gabriel Ferry, "had introduced money in fiction in a form so modern, so real, so acute. The novelists of the eighteenth century, and those of the first part of the nineteenth century, had not occupied themselves with the money question." We know that the "question d'argent" has taken, in all modern literature, as important a place as it has in real life. Balzac introduced it, and with what force, not only in the 'Peau de Chagrin,' but in 'Eugénie Grandet,' in the 'Parents Pauvres,' etc.; he well knew the power of Mammon.

Balzac became acquainted at Mme. Sophie Gay's with Junot's widow, the Duchesse d'Abrantès. He certainly borrowed from her salon many of the traits with which he paints the surviving members of the Imperial Army and of the Imperial Administration, the men whom fortune had carried across Europe, and glory intoxicated for a few years, and who had afterwards been plunged into poverty and obscurity. The Memoirs of Mme. d'Abrantès had an immense success in their time. She was a very extravagant person, and in the latter part of her life had no other resources than what she gained with her pen.

Mme. Sand has always been considered as the type of Camille Maupin, a literary woman who reappears from time to time in the "Comédie humaine." She figures in the novel 'Béatrix,' written in 1844, "with her impenetrable eyes, her Isis beauty, more serious than graceful, rather sad and constantly meditating, with long black hair descending in braids on her neck, like the double *bandelettes* of the statues of Memphis." A very different type was the "femme incomprise," a type which Balzac invented under the monarchy of July—the woman full of unsatisfied aspirations, of lofty thoughts not understood in her own narrow circle, a goddess among men, an angel on earth. A whole generation was enamoured of this "femme incomprise" revealed by Balzac. His living model, when he created this type, was a Mme. Carraud, a name which often recurs in his work. She had been educated in the same convent as Balzac's sister Laura. She married an officer of artillery, a good, honest man, without any ambition, who lived in retirement at Frapesle, near Issoudun.

"In the order of the feminine affections of Balzac," says M. Ferry, "Mme. Carraud occupies a very distinct place; she comes between his sister and Mme. de Berny." She was, it seems, a remarkable critic, and Balzac liked to consult her, paying great attention to her observations. He stayed with her for some time every year, either at Angoulême or at Frapesle. In 1832 he was so exhausted by work (he had just finished 'Louis Lambert') that he was afraid of becoming mad, as he had a most acute neuralgia of the head. Mme. Carraud reassured him, and told him that if such a misfortune should happen, she would never abandon him.

In 1831 Balzac had a correspondence with an anonymous person who made observations on his works. After a time the mask was thrown off, and the critic proved to be the Duchess of Castries (who was a Maillé), the sister-in-law of the witty Duke of Fitz-James. Under the Restoration she had been one of the most admired beauties of the court. An accident on the hunting field had made her an invalid; her spine had been hurt, aud she always lay upon a sofa. Balzac became one of her habitués. She was a great coquette, and Balzac interested and amused her. He became a dandy, showed himself at the opera, at the Bois. The Duchess, working on his innate conservative feelings, made of him a stanch Legitimist. He was beginning himself to confound living creatures and the creatures of his own imagination; he writes for instance to Mme. Carraud from Aix, where he was staying at Mme. de Castries's: "I have come here to get much and to get little; much, because I see a graceful, amiable person; little, for she will never love me. . . . She is the finest type of a woman, a better sort of Mme. de Beauseant; but are not all these prettv manners formed at the expense of the soul?" Mme. de Beauseant is one of the types of the "Human Comedy."

The Duchess was to make a journey to Italy with her brother-in-law, Fitz-James; they in-

vited Balzac to accompany them. He started with them and left them at Geneva—he never said for what reason. Mme. de Castries returned from Italy in 1833. Balzac's visits to her became rarer. He wrote his 'Duchesse de Langeais' in 1834; the Duchesse de Castries affected not to recognize herself in this type, and paid him compliments. Balzac afterwards wrote to a friend: "It took me five years to detach myself, with my tender nature, from a nature of iron, a graceful woman—the Duchess I have spoken of to you—who came to me under an incognito, which, to do her justice, she abandoned when I asked her to do so. . . . This liaison, which, be assured, remained, by the will of this woman, most irreproachable, proved one of the great troubles of my life. . . . I alone know all there was in the 'Duchesse de Langeais.'"

AURELIO SAFFI.

BOLOGNA, March, 1888.

JUST as we remember him thirty years ago, save that his hair is white, and the tall, slim form is more bent than then, is Aurelio Saffi to-day. The type of an Italian scholar, book-lover, and thinker by nature, revolutionist by force of circumstances, conspirator through necessity, after devoting his youth and manhood to helping Mazzini create a country, he has dedicated the last fifteen years to narrating the life, and to expounding the work and writings, of his master. It is a labor of love and patience, and will, when terminated, stand forth a noble monument to the noblest man that Italy has ever given birth to—as noble a one as any nation on earth can claim for her own. The sixteenth volume is out; on the seventeenth, Saffi is hard at work. The method of the workmanship seems to me most excellent. Each volume contains the most important writings of Mazzini in a year or series of years; the biographical and historical preface to each volume furnishing the reader with a complete sketch of the successive periods and phases of the Italian *risorgimento*. The first eight volumes of Writings published by Mazzini himself ended with the attempt of the 6th of February, 1853, to drive out the Austrians from Milan.

Saffi, in his first *proemio*, dwells affectionately on his personal relations with his fellow-triumvir after the fall of Rome.

"He had moments of darkest gloom, during which, silent and solitary, he avoided the company of the nearest and dearest. But these hours of passionate solitude yielded to the courageous, workful tenor of his nature, and when in domestic intercourse his bright humor was in full vein, his ways and gestures and epigrams, his mimicry—perfect while offending no one—made us all merry. How heartily I used to laugh at his anecdotes anent his student life at Genoa, the tricks of a certain *farçeur* familiar to the exiles of 1831 in Marseilles and Paris, or his own manœuvres in eluding and bewildering the not too wide-awake police in Switzerland. . . . 'Shut your books,' he would say to me—I had not yet got rid of my student habits, hedged round with classical fences and delighting in laborious erudition."

There is no laborious erudition in Saffi's writing now, but a painstaking earnestness in tracing the long, rough, uphill road trodden by Mazzini and his little band, who almost all fell without even his Pisgah's view of the Promised Land. This sixteenth, which must be read with the fifteenth and former volume, is intensely interesting, as it embraces the last three years of Mazzini's life, and closes on his death-bed, telling all, concealing nothing of his latest attempt to raise the republican flag in the spring of 1870, when, as he believed and as it is now proved, Victor Emanuel had pledged his royal word to assist the French Emperor in his attack on Germany, by sending a strong contingent of the Italian army across the Alps instead of seizing the opportunity to take possession of Rome.

"The victory of the Empire signified French hegemony over the minor States of western Europe and in the waters of the Mediterranean, and would have rendered the new Cæsar of the Gauls the supreme arbitrator of our destinies; nor would our contribution to his success, tendered as by vassals to their lord, have facilitated our entry into Rome, nor the completion of our national unity. Moreover, given the case of Prussian victory, this policy, base in every sense, and above all anti-Italian, exposed us, in virtue of our complicity, to serious and well-deserved reprisals. Rome, said Mazzini in those days, must be liberated from Milan, Genoa, Bologna, Naples, Palermo."

And here we have the hour-by-hour story of the conspiracy, unknown in many of its details to ourselves and even to Saffi until he secured from each individual conspirator the special narrative. Ernesto Pozzi thus tells of a midnight visit paid by Mazzini to the members of the revolutionary committee in the house of Vivaldi Pasqua (a Genoese duke) on the 24th of March, 1870:

"A revolution was prepared in Pavia and Piacenza: Genoa, Milan, Como, Brescia, Bologna, Naples, Catanzaro, and other important centres had agreed to second the movement. Mazzini, passing by Milan, reached Genoa by the last train. At Genoa the Revolutionary Committee awaited him in Via S. Lucca, N. 6, in the upper story of Giacomo Vivaldi Pasqua's house. All the members of the Committee were present; Stefano Canzio (husband of Garibaldi's daughter, Teresita), Antonio Mosto, commander of Garibaldi's crack corps of Genoese sharp-shooters, lamed by a Franco-Papal bullet at Monterotondo, Pasqua, Federico Gattomo, Giovanni Della Casa, Osvaldo Gnocchi-Viani, Giovanni Fontano, Enrico Razeto, Luigi Canessa, and myself.*

"The conspirators, here and there distributed in groups according to their respective destination, awaited the pass-word; sentinels with hidden arms lined the road Mazzini was to pass from the station. The night was dark, but as each solitary figure passed under the gaslights, Canzio and myself recognized them as we visited the posts on our way to Via Lucca. The guards of public security and carbineers in couples wended their way unsuspiciously, as though nothing unusual was occurring in Genoa. The members of the Committee, all armed, came in one by one, waiting in breathless silence for the advent of our chief. We expected to see him arrive in disguise to avoid recognition by the Argus-eyed police. . . . A tap at the door of Pasqua's apartment made our hearts beat; it must be Mazzini, we knew. It was he in body and in spirit, the great magician! Reverently we moved to welcome him. He, with the frankness of a boy, greeted us with his divine smile, and shook hands with all, addressing each of us by name. He wore no disguise, just his ordinary black dress and paletot and low felt hat over his brows. A spare, erect figure, he might have been a philosopher just come out of his study without a thought that could disturb the dreams of a world-wide police.

"We returned to our posts, Mazzini seated in front of me; and as he took off his hat and his head became visible, it was clear that the hat alone was sufficient disguise. Mazzini's head is a *chef 'dœuvre*, the vast forehead and luminous eyes a marvel. Calm as a general on the field, he asked for the latest details of our preparations, for the last news from the principal points of attack, the names of the appointed chiefs. Then he gave us his news, quoting from a tiny note-book in which places and names were written in cipher, and surprised us by his intimate knowledge of every spot in Italy, the conditions of the populace, the opinions of parties. A tempest burst over our heads, the rain rushed in torrents on the roof, flashes of lightning, followed by loud thunderclaps, lit up the room. 'The ancient Romans,' said Mazzini, with a sort of sad, proud revolt against Nature herself, 'would have augured ill for our enterprise, but,' he added in tones of authority, '*God will be with us.*' And in undertones to me, whom he knew to be an unbeliever in divinity—'if God exists, you would say.'

"If our plans had succeeded, the news from Piacenza and Pavia ought to have reached us on that night! [They had failed, owing to one of the common errors of conspirators, and the movement in Genoa itself was suspended.] 'To meet again,' said Mazzini; 'all is not yet ended.' He would not leave Genoa. He, the man of love and of tempests, could not accept the idea that Rome and Italian unity, abandoned by monarchy, were also to be abandoned by the Italian people."

From Genoa he went to Milan. The resurrectionary attempts in Calabria, in the mountains of Lucca and at Como, were suppressed one after the other. Mazzini, despairing of the Continent, went, despite the protests of his friends, to Naples, and thence to Sicily, where, betrayed by a German spy (who enjoyed his fullest confidence, and who, while still in the pay of Louis Napoleon, fought bravely under Garibaldi during the campaign of 1866), he was arrested and imprisoned in the fortress of Gaeta. But meanwhile the monarchy, understanding the alternative—the crown of towers in Rome, or a crownless, shameful eclipse—"went to Rome," and Italy was spared the disgrace and the disaster of fighting for the author of the chassepot miracles of Mentana.

In this volume, which appeared before Garibaldi's Autobiography, Saffi publishes letters which anticipate his reply to Garibaldi's erroneous yet naïve attacks on the Mazzinians. In the next volume, he writes, "I shall tell of Mazzini's latest thoughts and dying hours."

Intent as Saffi is on this his *own* work, he is still the centre and guide of the thinking youth of Italy, and his English wife, Georgina Crawford, is a fitting helpmeet for her noble husband. The Crawfords were among the earliest friends of Italy, and Georgina has been a faithful Mazzinian in every sense. If the infamous police regulations for fallen women are abolished, to the Saffis (after Bertani and the Nathans) will merit be due, and their four sons, all educated at the University, bid fair to follow the steps of their parents. Aurelio Saffi is "free" professor at the University, and his lessons are thronged. When, yesterday, he came to see me, a commission of students from the Democratic Club entered. The conversation turned on the topics of the day—the famous agitation for the statue to be (or not to be) erected to Giordano Bruno; the most unsatisfactory discussion on the liberty of the press which took place lately in the Chamber of Deputies. Saffi's suggestions were all wise, and listened to with reverent attention. "Demonstrations, agitations are useful when they have a fixed and justifiable object. Because the Government is not our ideal, we ought not to offer factious opposition. It will be well if we get Bertani's sanitary code, Zanardelli's penal code, the abolition of the regulations," etc. Foreign politics were of course discussed, and, far more than I expected, the German alliance is increasingly popular. I say unexpectedly, because republican France, has always been very dear to Italian democracy. But what with the commercial treaty and the scares, and the rumored attack on Spezia, a suspicion is growing into a settled belief that France, imperial, legitimist, or republican, is jealous of United Italy, regrets the contribution to its formation in 1859, and would, if unable to destroy the new kingdom, enfeeble it to such a point as to make it dependent on France itself. Saffi and the thoughtful portion of the old Mazzinian party, being unitarians before all things, perhaps ex-

* As I trace these names, it just occurs to me that, with the exception of Mosto, who remained in Genoa to organize the expedition, every one of these "Mazzinian conspirators," including Ernesto Pozzi, accompanied or followed Garibaldi at the end of that year (1870) "to help republican France invaded and crushed." Is not this a fresh proof that Mazzinians and Garibaldians were one and the same—that thought and action were inseparable?

aggerate the possible danger. On the other hand, they see no danger in an alliance with Germany, especially if poor "Fritz" (so really liked by Italians, who also are charmed with his wife for her interest in social questions) should live for some years; then, in case of a war, there is the chance of getting back the Tyrol and Trieste, the unredeemed provinces of Italy. In my humble opinion, Italy need not have entered into an offensive alliance with any nation. Her interests on the Mediterranean are identical with those of England, and there is no doubt that the unwritten Anglo-Italian alliance is really stronger at the present moment than any parchment bond between Bismarck and the Italian Minister. He will do well to remember that Italians are not Germans, and that, while they may worship a Cavour, they would not tolerate a Bismarck in duodecimo for a moment. But Crispi is still on his trial, and if ever a man had a fair field and all favor, it is he. Saffi applauded his Vatican policy, which is his strong point.

At the end of our long interview, the students asked him if there was any truth in the rumor that the University centenary was to be celebrated in a church, and inaugurated by a Te Deum? "Not if we are to have anything to do with it," answered Saffi. "It may be held in a church which is municipal property, if there be no other safe building large enough; but no religious color can be permitted." Then, on the students' saying they wished to invite Bovio (the celebrated Professor of Philosophy at the University of Naples and head of the Democrats in Parliament) to hold a Democratic conference, Saffi said: "That is good, and I will sign the invitation as I signed that to the King. Let us avoid any appearance of party spirit in this commemoration of our dear old University."

Long may cruel death, which has devastated the ranks of the "Old Guard," leave us this true heir of Mazzini's spirit, the true interpreter of his life and work. J. W. M.

Correspondence.

JOURNALISTIC PURIFICATION.

To the Editor of The Nation:

Sir: The question of how to obtain the news in a form fit to be delivered at home, has troubled me not a little, as it has troubled thousands who have families with children growing up to the reading age. I can see no solution unless some of the technical journals—noticeably those devoted to architecture—furnish the model. Some of them publish two and one as many as three editions, differing in the number and costliness of illustrations, in the "supplement" form. Why cannot our dailies publish a regular edition which shall be such as decent people may read and have delivered at their homes without offence; then another edition with a supplement containing the "sporting events," lottery "ads.," the illustrations, etc.?

A really enterprising journal would find opportunities for contracts to deliver the regular edition at the homes and the supplements at the down-town offices, at a profitable advance on the usual subscription rates. Able editors might vie with each other in getting up these supplements so that bound volumes of them would sell. The more costly edition might attract wide attention under some such name as the "Sport's Own" or the "Prize Ring" edition, or, perhaps, without entire inappropriateness, might adopt the names in use by some of the architectural journals referred to, as, the "Imperial" or the "Royal" edition.

Yours, etc., A Fogy.

April 8, 1888.

PENSIONING SUBSTITUTES.

To the Editor of The Nation:

Sir: In the discussion of the various pension bills, one feature has, I think, been overlooked, which allow me to present. Its consideration may perhaps serve to convince even those who honestly advocate indiscriminate pensioning, of the injustice of putting on the same plane those who went into the war from patriotic motives and those who went into it for gain.

In 1863 and 1864 I served for the Government as examining surgeon for drafted men and substitutes in one of the largest districts of the West, and thousands of that class came under my eye and personal observation. It was at a period when State, city, and county bounties were plentiful, when the bone and sinew of the country was already in the field, when the Government ordered drafts from among all able-bodied citizens up to the age of forty-five, and when it may be said that every man passed by the surgeon and recruited into the ranks was, paradoxical as it may seem, an involuntary volunteer—that is, he was either a man who was forced into the ranks because he was too poor to buy a substitute, or he was a substitute who sold himself into the army for big money. I kept a private record at the time of the percentage of these two classes, which is now lost, but I venture to say from recollection that not 10 per cent. of the accepted belonged to the former class, and that 90 per cent. were substitutes.

The scenes which presented themselves at the examining surgeons' offices at those times were sometimes ludicrous (because of the attempted simulations), sometimes pathetic, but in the main disgraceful and disgusting. Dealers in substitutes were on hand with their stock in trade ready for inspection. These dealers (brokers they called themselves) sprang up like mushrooms—a sharp, conscienceless, unscrupulous class, ready for cheat, bribe, or any kind of deceit to sell their man. They scoured the lowest dives of the cities and towns for material. They watched all the steamboat landings for contraband and plantation negroes, such as poured out into the North and West from the rear of our advancing armies. They rented large apartment houses whereto they took these men, boarded them, gave them clothing, got them drunk, and made them sign a printed blank agreeing, for the consideration therein mentioned, to serve as substitutes. The consideration generally was small; if the man was rejected, the dealer lost his advances; if accepted, his profit was immense. In these houses they held them as prisoners until they could sell them. The market price for substitutes changed with the supply and demand, varying from five hundred to two thousand dollars apiece, and the brokers all over the country had a regular system of exchange in this commodity.

The substitutes offered were nearly all either foreigners recently landed, bounty jumpers, or negroes recently freed. The scum and the dregs of Europe, attracted by the bounties, dumped themselves into this country for sale into the army. The devices resorted to for hiding physical defects that would cause rejection were sometimes ingenious. The lying, especially as to age, was tremendous. As fast as a substitute was rejected by one surgeon, he was taken or sent by the broker into another district to a more facile officer, and there, in many instances to my own knowledge, accepted. The bribery and corruption in this traffic were scandalous.

As a rule, the white men presented (at least in my district) were unfit—though many were accepted—while the negroes generally had a splendid physique, except that, strange to say, the larger portion had a loathsome complaint, which, however, under instructions from the General Army Surgeon, if of a mild character, did not disqualify them from being accepted.

It would be interesting for a war statistician to ascertain from the enlistment records the number of men who entered the army as substitutes. It seems to me that the ardor, as to pensions, of the most patriotic G. A. R. man would cool down when it is proposed to put men who were sold into the service like cattle on a level with the honest, sturdy, noble volunteer who entered the ranks for his country's sake and not for the sake of money. I have no doubt that there are many still living who served as examining surgeons at the time of drafts, and whose experiences in this particular were similar to mine. Statements and discussions on that point might perhaps bring the facts here set forth so strongly before the public and Congress that, if not resulting in a halt to indiscriminate pensioning, it may lead to an adoption of the principle that the man who sold himself into service is not entitled to the same consideration as the man who entered it from patriotic motives. J.

ENTRANCE REQUIREMENTS IN WOMEN'S COLLEGES.

To the Editor of The Nation:

Sir: In the *Nation* for March 20 appears a communication upon entrance requirements in women's colleges. May I be permitted to call attention to one or two suggestions of the writer which seem to me to be misleading?

The statement is made that "admission on certificate was followed by an eleven-fold increase of students at Smith." That certainly strikes one as worthy of remark, but sequences are not always consequences. Smith College began its work with one class of twelve students. In the fourth year, when three more classes had been added, it is true that there were 133 students in the institution. To give the credit of this increase, however, to the system of admission by certificates is entirely gratuitous, and would imply very small appreciation of the rapid growth of interest in woman's education. Each succeeding class has been larger as the public has learned to appreciate the value of higher education for women, and as the preparatory schools have become accustomed to send students to these colleges. The matter of certificates has probably had very little influence upon the numbers attending Smith, and we are confident that students have not on this account been admitted with any less thorough preparation. The standard of the College was never before as high as it is now, and the President and Faculty were certainly never more ambitious to keep it at the highest possible point, and fully on a level with the best institutions of the land.

The writer of the article referred to goes on further to say:

"An examination of the forms of certificates discloses how cumbrous the system is, how many exceptions to the rule prevail, how easily the instructor may shirk responsibility for a student's failure after she has entered college, and how numerous are the opportunities for abuses to creep in. Stated generally, certificates are now accepted from 'approved'

schools and individuals. This approval has been based upon actual experience in educating pupils prepared at the school, or a visit by one or more of the College Faculty, the recommendation of a trustee of the College, or a self-appointed committee of alumnæ, or even a mutual friend. These visits, it is said, have sometimes proved purely social in their nature."

These statements and implications are of considerable variety, and lead the writer to the conclusion (whatever may be the conviction of the reader) that it is a "baneful" system, fit only to be met by protests. Without proposing to discuss the question, it is fair to enter a reminder that the best educators of the older institutions are far from being all of one opinion, and that the system is not by any means confined to colleges for women. I am, furthermore, confident that it need not, and should not, result in any lowering of the standard for admission. I may add, inasmuch as Smith College has been especially alluded to, that, as a matter of fact, very rarely, under present usage, is a school added to the list of those from which we will accept certificates until sample examination papers, with the actual answers of the pupil, have been sent to the examiners, and in all cases valid evidence must be given that the full requirements have been met. I may add, further, that by no means have examinations been given up, and that we have every year opportunity to compare students who enter by the different plans, and have not been able to discover that students are more apt to come inadequately prepared under the one method than the other. Those who have to be warned or conditioned for poor scholarship after entering, come in quite as large a proportion from those who are examined as from the others.

There are many possible objections to any scheme which can be devised. All must depend in the end upon the members of the Faculty who have the responsibility of admitting the new students. It is, apparently, an opinion prevalent in some minds that the plan of accepting certificates is adopted with the simple aim of gathering students at the expense of the scholarship of the college, and that any such purpose would be thwarted by substituting examinations. It is manifest, however, that under either plan the college can degrade itself, if it will. Conscientious care can, on the other hand, with either system, protect and sustain the highest standard of scholarship. The students of all institutions are sure to come into comparison, and we are willing to accept the verdict of results.

HENRY M. TYLER,
Chairman of Board of Examiners.

SMITH COLLEGE, NORTHAMPTON, April 9, 1888.

TO THE EDITOR OF THE NATION:

SIR: It seems to me that a good deal of the discussion in your columns on admission to colleges by certificate has not shown a good grasp of the real question at issue. When there are three possible ways of accomplishing an object, it is not sufficient, in order to recommend a certain course, to show that it is superior to one of the others; it must be shown to be superior to both of them. This looks like a very simple rule of logic, but it has been very much sinned against in your columns.

The question is, in the first instance, not a question that concerns women more than men, since such important colleges as Michigan University and Cornell have adopted the plan of certificates. Hence I shall make use of the common pronoun *he* in what I have to say.

There are three ways, all in actual use, by which students may be admitted to colleges: (1) by an examination at the college, (2) by local examination, (3) by certificate. The first method, which has been the only one until recent years, is open to two plain objections. If the candidate comes from a distance, a considerable expense is incurred for the journey, which is money thrown away in case he proves unsuccessful; and the fatigue of the journey, the strangeness of his surroundings, and an incipient homesickness make the student more or less incapable of doing himself full justice. These are real objections to the first method. They are completely obviated by *both of the other methods*, and yet one at least of your correspondents seems to think that it is only necessary to insist upon these two objections with sufficient force in order to prove the desirability of admission by certificate. The only allusion he makes to admission by local examinations is to say that it "seemed undesirable." But the only interest in the discussion lies in the full and complete statement of the grounds for choosing either plan (2) or plan (3) in preference to the other; everybody is agreed—Harvard, Yale, and Princeton included—that plan (1) needs to be supplemented by at least one of the other plans.

The arguments in favor of the system of local examinations rather than that of certificates are these:

(*a.*) They relieve the teacher of a serious responsibility which there is no reason for his being required to assume. The distinction which his school acquires from having well-prepared pupils is even more marked if they pass good examinations than if they merely enter college on his recommendation.

(*b.*) They relieve the student of the anxiety of not knowing for a whole half-year whether he will be allowed to continue with his class or not, and they save him from the mortification of being, in a sense, expelled on account of insufficient preparation. There is far more publicity and disgrace attached to being sent home than to simply failing, in the first place, to pass an examination.

(*c.*) They furnish, from the nature of the case, a far more satisfactory test of the real acquirements of the pupil than can be had from the opinion of any teacher, however honest and capable he may be. It is impossible that the teacher in every school, taken at hazard, should have as exact an idea of what constitutes a sufficient preparation for entering upon a given study as the head of the department in the college in which that study is to be pursued.

(*d.*) They are not liable to abuse, as the other plan plainly is in the hands of dishonest and incapable teachers.

(*e.*) The most important reason in their favor is that they furnish a far more effective means of raising the standard of the preparatory school than the plan of admission by certificate. To pass the examination is a test that can only be met by a thoroughly good school; the privilege of getting students in by certificate is always open to the charge of favoritism. The local examinations might be taken by many members of the school besides those who are expecting to go to college, and they would thus furnish a general test for the school, and not simply for those students upon whom special pains have been expended. The Bryn Mawr circular expressly states that "the examination for matriculation will be open to those who wish to take it as a test of proficiency in elementary studies, but have no intention of entering the college."

Your correspondent, "M. A. W.," is of the opinion that the certificate system has been the cause of an improvement in the preparatory schools from the fact that the certificate system and the improvement have existed side by side. This sort of argument is one which it is very hazardous to make use of. There is every reason to suppose that the schools would have improved in any case, as they became more familiar with the requirements which the colleges made of them. The most that can possibly be shown by the facts is, that the *effect of the certificate system has not been so bad as to counterbalance whatever improvement would naturally have taken place in the schools in the same time.* It remains to be shown that a much greater improvement would not have taken place if the system of local examinations had been chosen instead. This is, again, a simple matter of logic, which, however the discussion may turn out, it is a pity not to see attended to.

Local examinations are not difficult to have well conducted. They are already held by Vassar at nine regular centres—Chicago, Cincinnati, Cleveland, St. Louis, Detroit, Louisville, Omaha, Denver, and San Francisco—and provision is readily made for special cases as they arise. The plan recommended by Mr. Beckwith of having a joint local examination-paper prepared which could be accepted by a large group of colleges (for both men and women) would seem to be an admirable one.

C. L. F.

TO THE EDITOR OF THE NATION:

SIR: The remarks of Mr. Beckwith in regard to the admission of students to college on certificate must have appealed to many teachers. If I can judge from my own experience, it is not agreeable to a teacher in a preparatory school to decide himself whether his pupil is fit to enter a particular college. Aside from the difficulty a teacher may find in keeping himself informed of the exact standard maintained at each college, many teachers feel that they are constantly liable to overrate the acquirements of their pupils. Furthermore, when a teacher comes to draw the line between those of his pupils who are prepared for college and those who, having studied an equal length of time, are, through lack of ability or of diligence, not yet fit to enter, he exposes himself to the suspicion of favoritism or prejudice. This is just what the Harvard examiners seek to avoid when they require the examination-papers to be signed with numbers instead of names, so that they do not know whose papers they are marking.

Mr. Beckwith's suggestion that a common entrance examination be given by a committee representing the New York and New England colleges seems worthy of attention. It would help to bring all the Eastern colleges up to the same level. As it is now, no one can tell how much a man's degree represents till he knows at what college he received it.

But even when the requirements for admission are nominally equal, we cannot tell whether two colleges are on the same footing unless we know how rigidly the requirements are enforced. The smaller colleges are constantly tempted to lower the standard of admission in order to let in more students. Some of the readers of the *Nation* may know what pressure is sometimes put upon instructors to pass men insufficiently prepared. This is done by the President or by trustees who want students, and do not realize the necessity of exacting a certain amount of technical attainments. Why do Americans always gauge the success of a college by the number of its students?

Let me say here a word about the results of admitting students inadequately trained to the Freshman Class. It must be remembered that a good teacher suits the pace to the average

ability of his class. If the class contains many poorly grounded members, he either has to go back and spend time in reviewing the elements, or, at any rate, he is forced to proceed with a slowness which needlessly keeps back the better prepared part of the class. These inequalities are particularly injurious where the class is too small to be divided into two sections.

As for the unfortunate youth himself who enters college with insufficient training, he goes through the first half of his course with, as it were, a millstone tied around his neck. In his case, how many of the professor's remarks fall on deaf ears, because he is not prepared to appreciate their force. I lost, I believe, half the benefit of the excellent instruction in Greek we received at the small college where I spent the first years of my student life. And why? It was because, although I had never been properly grounded in the elements of that language, I was yet suffered to enter college. It was no kindness to me, was it? Under such circumstances an ambitious student is likely to injure himself by overwork, while one of the ordinary sort becomes permanently discouraged, and goes through his tasks as a kind of drudgery in which he can never take any real interest.

C.

ANNANDALE, N. Y., April 15, 1888.

A QUESTION OF INDEBTEDNESS.

TO THE EDITOR OF THE NATION:

SIR: Mr. Seligman's answer in the *Nation*, No. 1187, to the notice of his book in No. 1185, only strengthens the impressions and conclusions of the reviewer. At the outset he admits his great obligations to Gross, and yet he devotes a later portion of his letter to a denial of this fact. "I should be sorry to underrate my obligations in chapter i. to Dr. Gross," does not square with "It was only when the chapter had been substantially written that Dr. Gross's essay appeared." This self-same contradiction appears in Mr. Seligman's Preface, and hence the reviewer called the acknowledgments of indebtedness to Gross equivocal.

Mr. Seligman evades the issue when he denies that he blindly copied references, without consulting the works referred to; he was not accused of doing this. The real question is this: Did not Gross furnish Seligman with the clue to more of those references than the latter acknowledges? The few authorities which Mr. Seligman in his letter says are not mentioned by Gross, are, in part, actually to be found in the latter's treatise (*e. g.*, 'Historic Documents of Ireland,' Gross, p. 56); the others are, in great part, local histories substituted in Mr. Seligman's book for other, mainly superior, works cited by Gross on the same subjects. The contention of the reviewer was, that Mr. Seligman added no *important* references—none that advanced our knowledge of the subject by giving materials not presented by Gross. A sprinkling of new but unimportant references can be added to almost any treatise; but the former will not transform a compilation into a book of original research.

Mr. Seligman contends that the references common to the two books "are the common property of all scholars, and are mentioned almost without an exception in the works of Brady, Madox, Thompson, Stubbs, Merewether, and Stephens." The latter part of this statement we emphatically deny. In which of these authors did he find the references to the very important Southampton Gild Ordinances, the 'Historic Documents of Ireland,' Barrett's 'Bristol,' and the valuable passages relating to the gild in the 'Abbreviatio Placitorum,' 'Placita de quo Warranto,' Blomefield's 'Norfolk (Lynn),' etc., etc.? Mr. Seligman talks as though he and Mr. Gross both exhausted the printed sources independently. But this is far from being the case. The striking sins of omission in both works are identical—another strong ground for our believing that the one was based mainly on the other. In the following printed books Mr. Seligman will find much very valuable "common property of all scholars" which both he and Mr. Gross failed to discover: 'Record of Caernarvon,' 158–198; Battely, 'Antiquitates Sancti Edmundi,' 159–160; 'Chartae, etc., Hiberniae,' *passim;* Gale, 'Inquiry into Corporate System of Ireland,' Appendix; 'History of Guildford,' *passim;* 'Rotuli Hundredorum,' i., 332–334, 461, etc.; Lascelles, 'Liber Munerum,' part i; Devon. Assoc. for Advancement of Science, etc., Trans., xi., 191–212; Wilts. Archæol. and Nat. Hist. Soc., Magaz., iv, 160–174; and, above all, the reports of the Municipal Corporations' Commission of 1835. If Mr. Seligman will digest these references, he will be able to add some new sections to his book; and it may dawn upon his mind that in historical research the sources are like rich beds of ore—valueless until discovered and exploited. In original investigation on such a subject as the gilds, to bring together passages from widely scattered sources is half the battle; and he who does it ought to get full credit for his labors from his successors who write on the same subject and make use of his work.

Mr. Seligman's enumeration of the new arguments contained in his book is a confession of weakness. Sifted down it amounts to this: he actually differs with Gross on a single point—one which the latter advances, with much diffidence, as a conjecture. As for the relation between the gild merchant and the crafts (Seligman, pp. 58–60), that, we admit, is not given by Gross, who postponed his treatment of this subject for a future time. But the substance of it is to be found in Stubbs. Had the work of Mr. Seligman been one of exhaustive original research, he would have treated this topic in a fuller and abler manner. We reiterate that the kernel and substance of Gross's book is contained in that of Seligman, with only unimportant additions. This the latter practically admits in his letter and in the preface of his essay.

Mr. Seligman has this to learn, that if he prints an essay containing substantially the same materials and results (including many peculiar turns and ramifications of thought) as are contained in a work of original research printed four years before his own, he must be prepared to acknowledge his obligations to his predecessor fully and unequivocally. If he does not do this, he must expect either that reviewers will berate him, in most cases, more severely than did the critic in No. 1185 of the *Nation*, or that psychological societies will discuss the wondrous similarity of cerebral movement and cerebral sinuosities displayed by him and his predecessor.

THE REVIEWER.

LONDON, April 6, 1888.

Notes.

WM. R. JENKINS will shortly publish the first part of Prof. M'Fadyean's 'Comparative Anatomy of the Domesticated Animals.' He has just issued Victor Hugo's 'Quatre-vingt-treize,' uniform with his handsome reprint of 'Les Misérables,' and announces his intention to continue the series till it includes all of Hugo's novels. To his "Théâtre Contemporain" he has added Erckmann-Chatrian's "L'Ami Fritz."

Mr. F. W. Taussig's 'Protection to Young Industries' and 'History of the Present Tariff,' enlarged with new matter, will be consolidated into one volume of present interest and value, 'The Tariff History of the United States (1789-1888),' and published by G. P. Putnam's Sons. The same firm announce further 'A Sketch of the Germanic Constitution' to 1806, by Samuel Epes Turner; and 'The Present Condition of Economic Science,' by Edward C. Lunt. Their issue of Franklin's Works, edited by Mr. John Bigelow, is now nearly completed, and will be followed by a uniform edition of the 'Correspondence and Diaries of Washington,' edited by Worthington C. Ford.

Paolo Mantegazza's 'Testa; a Book for Boys,' translated by Prof. L. D. Ventura, is in the press of D. C. Heath & Co.

The fourth volume of 'Appletons' Cyclopædia of American Biography' has made its appearance (Lodge-Pickens).

Ticknor & Co. send us a new edition, revised, of Laurence Hutton's 'Literary Landmarks of London.' The book, though reduced in quality of manufacture as in price, is still both presentable and readable. Its arrangement is by authors in alphabetical order. The supplementary notes show what havoc time is making with the monuments extant when the first edition was published.

Mr. T. W. Knox's 'Pocket-Guide to Europe' (Putnams) renews itself with a list of cures, baths, and springs, having their several medicinal properties indicated; and with tabulated "Travel Talk" in four languages—English, French, German, and Italian. This is rather a vocabulary than a phrase-book. There are very few complete sentences, and the editor's imagination is very meagre. Ten nouns, one adverbial phrase ("on board"), and one interrogation ("Does the train stop at intermediate stations?"), form the complete linguistic outfit for "travelling by railroad and steamboat."

The success attendant upon their large-paper edition of Dean Stanley's 'Memorials of Westminster Abbey' last autumn, has encouraged Messrs. A. D. F. Randolph & Co. to bring out the work from the same plates in a popular duodecimo form, handsomely printed and bound in green cloth. The price now asked for the three volumes is as low as would be thought possible for such excellent make. The etched frontispieces have given way to process cuts, but in the case of the Poets' Corner this will hardly be accounted a loss.

'Alden's Manifold Cyclopædia of Knowledge and Language' (New York: John B. Alden) is avowedly an abstract in the main of Chambers and of Stormonth. It includes men of the time. The form is handy, and a single column is employed. The sparse illustrations have been borrowed from Chambers and from other sources. Vol. 1 extends from A to America.

Dr. C. W. Larison of Ringoes, N. J., whose independent phonetic labors we have frequently remarked upon, has just published 'Solomon'z Song, with an Introducshun and Nots,' in a type which we cannot imitate here. He has cast the Song in a dramatic form, with stage directions, as, "The Brīd stats," "The corus ov attendant virjinz appruvingli ecsclam," "The Brīd relates a sircumstans ov inattenshun tu her Brīdgrum," etc. The commentary is copious. Having made the above innovations, Dr. Larison might properly have gone further, and adopted the text and the poetic arrangement of the Revised Version, instead of following the old.

Miss Nina Moore has, with no little dexter-

ity, told in an attractive way, easily intelligible by children, "the story of the planting of Plymouth and Boston" ('Pilgrims and Puritans.' Boston: Ginn & Co.) She has drawn textually more or less upon the original authorities, and, by means of plenty of maps, portraits, and views, has made the narrative impressive at every stage. Finally, the notes reserved for the end of the little volume serve for a glossary and for precise reference to the sources and to collateral reading. We have thus a very well-conceived and well-executed text-book, useful to young and old.

For aids to French instruction we can also recommend 'Florian's Fables,' selected and edited by the Rev. Charles Yeld, with illustrations; Molière's 'L'École des Femmes,' edited by Mr. G. Saintsbury; and the first three books of Thierry's 'Récits des Temps Mérovingiens,' edited by G. Masson and A. R. Ropes. The last two works bear the imprint of the Cambridge (Eng.) University Press, but all, like the first, come to us from Macmillan & Co.

An American *Notes and Queries* is to be launched in Philadelphia on May 5, under the editorship of Messrs. William S. and Henry C. Walsh. The place of publication is 619 Walnut Street.

The second number of the *Journal of Morphology* retains the high place taken by the first, and likewise fulfils the hope we expressed when speaking of the first number, that more vertebrate material would be forthcoming. Of the five pages, the illustrated three treat of the development of the lamprey, the lizard, and the opossum, respectively, and are by Professors Scott and Osborn and Mr. Orr of Princeton. The editor discusses, under the rather new term, "oökinesis," "The Kinetic Phenomena of the Egg during Maturation and Fecundation," and the number concludes with "Some Observations on the Mental Powers of Spiders," by George W. and Elizabeth G. Peckham, so interesting and instructive that it is almost ungracious to remark that the paper relates much more to the senses than to the "sense," and that Physiological-Psychology is very far from pure Morphology. The admirable "summary" of one of the papers accents the lack of that important feature with the others. Mechanically, the number is nearly perfect, but on p. 378 occurs "septæ for septa," and the contents of No. 1 has "philogenetic" for phylogenetic.

The second number of Dr. Stanley Hall's *American Journal of Psychology* has three leading articles—one "On the Relation of Neurology to Psychology," by Henry H. Donaldson; the second, "Insistent and Fixed Ideas," chiefly the story of a single case of insanity, by Prof. Edward Cowles, and "A Critique of Psycho-Physic Methods," by Joseph Jastrow. Book reviews and notes in abundance fill out the number.

Weeks have elapsed since we ought to have acknowledged receipt of the Proceedings of the American Society for Psychical Research for December (Boston: Damrell & Upham). A tilt between Mr. Edmund Gurney and Prof. C. S. Peirce occupies a large space in it. Miss Alice C. Fletcher treats at length of the supernatural among the Omaha tribe. There are the usual reports of committees. Perhaps the most curious paper is that by Dr. William James on the "Consciousness of Lost Limbs."

A second series of papers has begun to be issued by the Department of Philosophy of the University of Michigan, led off by Prof. John Dewey on the "Ethics of Democracy"; Prof. Alexander Winchell on "Evolution and its Speculative and Religious Consequences," etc. (Ann Arbor: Andrews & Co.).

The interesting observation is made by Dr. Underwood, Customs Medical Officer at Kiukiang, China, that the comparative immunity of the Chinese in that region from typhoid fever, notwithstanding most of the factors favoring it are present in abundance, may be attributed to the fact that "cold, unboiled water is rarely or never used when tea can be had." This piece of practical wisdom others than Chinese might bear in mind in dangerous localities. At Seoul, Corea, more than 6,000 deaths from cholera occurred in six weeks in 1886, in a population of 150,000, but none in the European community of 56 persons. Protection was attributed by Dr. Allen to general cleanliness and the use of only boiled and filtered water for drinking, cooking, and the toilet, and the non-purchase of food in the Corean market. The number of the foreigners is too small to carry great weight, and it is probable that other differences in life contributed to their exemption. But the water lesson, so far as it goes, is as applicable at home. These memoranda occur in the Thirty-third Medical Report, published by the British Inspector-General of Maritime Customs in China.

In a reprint from the *Medical News* of September 5, 1887, Professor Leeds of the Stevens Institute describes an investigation of an epidemic of typhoid fever at Mt. Holly, N. J., which is a fresh illustration that drinking water polluted with animal putrescence is the most common cause of such outbreaks. But much more important is the apparent discovery that minute quantities of alum (a half grain to the gallon) will sterilize the water by the precipitation of the bacteria with the organic matter when of peaty nature, or with alkalies previously added, the whole precipitate being removable by filtration. If this is confirmed, and the reputation of the reporter leaves no reason to doubt it, a very important agent has been added to the resources of preventive medicine.

Mr. Francis Parkman has lately apprised the Massachusetts Historical Society of the discovery in France, by the Abbé Casgrain of Quebec, of a mass of papers collected and arranged by Gen. Lévis, Montcalm's second in command, that relate to the American campaigns in which they participated. They fill eleven volumes, and have great historical importance.

The library of the late Baron S. de la Roche La Carelle, which is to be sold in Paris from April 30 to May 5, offers an especial attraction to collectors who affect fine bindings. Accompanying the large-paper catalogue sent us by Charles Porquet, 1 Quai Voltaire, are heliogravures, in black and white and in color, of the more beautiful specimens—Bibles and prayer-books, the Latin and Greek classics, histories, belles-lettres, science, and theology. These plates are themselves a valuable possession for the connoisseur. Some of the most famous private libraries in France have, in their breaking up, contributed to M. de La Carelle's, now in its turn to be dispersed. We must add mention of the Baron's etched portrait, the frontispiece of the catalogue. A sketch of his career as a bibliophile is furnished by M. Quentin-Bauchart.

In reviewing a novel by an American authoress, the Milan *Perseveranza* pays homage in dubious typography to "W. D. Flowel," "Mark Zwain," and "Francis Burnett." It is both just and natural to attribute these little slips to the printer, and not to the writer (except as a bad penman).

Those who, for the sake of the man or as a landmark in the history of American book-illustration, would be glad to own a likeness of the late Felix O. C. Darley, need seek no further than the gallery of Mr. F. Gutekunst, Philadelphia. The phototype portrait which he has just issued (in cabinet size) is both a very pleasing memorial of a genial man and artist of much individuality, and an admirable example of Mr. Gutekunst's permanent photographic process.

The Executive Committee of the Trustees of the American School of Classical Studies at Athens, with Prof. Lowell at their head, make an appeal for an endowment fund of one hundred thousand dollars. It appears that Dr. Charles Waldstein's acceptance of the permanent directorship in October next depends upon the raising of this endowment before August 1. Our readers are already aware of the principal facts in regard to the comfortable housing and the brilliant field work of the School. Subscriptions may be sent to the Treasurer, 67 Mt. Vernon St., Boston, or to Prof. Charles Eliot Norton, Cambridge, Mass.

—Messrs. Henry Holt & Co. write us that the statement in our recent review, 'Some New German Grammars,' that "Prof. Joynes . . . has once before worked over a grammar, viz., Otto's," is erroneous, "Prof. Joynes not having had to do with the revisions of 'Otto's German Grammar.'"

—To librarians desiring to extend or complete their collections of the publications of French societies we commend the 'Bibliographie des Sociétés savantes de la France,' by Eugène Lefèvre-Pontalis, recently issued in delightful typography from the Imprimerie Nationale at Paris, in a quarto volume of 142 pages. This work is published by the Department of Public Instruction, under the immediate superintendence of the Comité des travaux historiques et scientifiques. From the preface we learn that there are no less than 655 societies of various kinds, exclusive of the numerous associations for the encouragement of agriculture and horticulture, which are omitted, in 197 cities of France. Paris naturally takes the lead, 142 literary, artistic, or scientific associations holding their meetings in that city. There are 12 additional societies in the French colonies, 9 in Algiers and its provinces, 2 in Cochin China, and 1 in the island of Réunion. The publications of all these learned bodies, to the end of 1886, number about 15,000 volumes, and the present annual increase to this literature the author estimates as something like 500 volumes. An examination of the catalogue shows that the Paris societies alone have issued more than 4,700 volumes. The greater part of the institutions enumerated have come into existence in the fifty years between 1830 and 1880, but not a few of them are of considerable antiquity, no less than six dating from the seventeenth century. The Académie Française came into existence as early as 1635, but its first publication recorded, the widely known 'Dictionary,' did not appear until 1694; the seventh edition of it being published in 1878. The National Academy of Sciences, Arts, and Belles-Lettres of Caen is only seventeen years younger than the Paris Academy, having been founded in 1652. The Bordeaux Academy dates from 1662, the Paris Academy of Sciences from 1666, and the Academy of Nîmes was founded in 1682. The Académie des Jeux Floraux of Toulouse is stated to have existed in the fourteenth century under the name of "Collège du gai savoir et de la gaie science," and to have been reorganized in the fifteenth century by Clémence Isaure. In the month of September, 1694, letters patent were received from Louis XIV. under the present title, and two years

later there was published the first little volume of the series entitled, "Recueil de plusieurs pièces d'éloquence et de poésie," which extended almost without break to the year 1790, and was followed by the "Recueil de l'Académie," an unbroken series from 1806 to the present time, forming altogether a collection of 157 volumes. All six of these societies are still flourishing, but the Royal Academy of Painting and Sculpture of Bordeaux, which was founded in 1690, closed the first term of its existence in 1709. It was revived in 1769, but finally dissolved in 1793. Twenty-seven new societies are recorded as having been founded in 1881, twenty-one each in 1882 and 1883, twelve in 1884, four in 1885, and seven in 1886.

—This catalogue seems to be a most conscientious piece of work. Very few entries are to be discovered in which the facts aimed to be supplied are not fully and clearly set out. Care has been taken to indicate all indexes to series or parts of series of society publications, whether such indexes are separate volumes or are contained in certain volumes of the series. The peculiar arrangement of the work—primarily an alphabet of the departments of France, and under each name of a department a sub-alphabet of the towns in which societies are located—is not entirely the most convenient for a foreigner not thoroughly familiar with the geography of France, and it would have been an aid to the latter had there been added an alphabetical index of the names of the societies.

—'Auf Anlass des Volapüks' (Berlin: Robert Oppenheimer) is the title of an attractive brochure of forty-six pages, by Hugo Schuchardt, in which the author touches upon a number of linguistic questions. It was not so much Volapük itself, he tells us, that prompted him to write, as the hostility to it manifested by scientific linguists. He admits that many of the objections to Schleyer's language are reasonable, though he is not at all certain that it may not be best to let well enough alone (*das Bessere der Feind des Guten sein mag*). The root of this hostility he finds in one thing: Volapük is an artificial language. He instances as a sort of Volapük the "corrupt" Portuguese in which, 300 years ago, Chinese, Malays, Tamuls, and Hindus did business with each other, and which has maintained its existence to a considerable extent down to the present day, and that, too, in a tolerably uniform condition. This language was not gradually developed from the original Portuguese. "The Portuguese who landed on the shores of India came as Volapükists," and broke up their language for the natives, with the sole object of making themselves readily understood. From such a language Volapük is distinguished only by its broader basis and its well-laid plan. The author emphasizes the pressing need of a world-language, which he considers "the crown of all our international arrangements." Not only so, but he looks upon such a language as a scientific desideratum. Disagreeing entirely with Whitney, "who characterizes the thought of such a language as utopian, its realization as undesirable," he holds with Sayce that a world-language is "the dream of linguistic science," and holds with Sayce and Max Müller that such a language is a perfectly practicable thing. In the author's opinion, the Aryan type of language has been unduly exalted. It has come to be looked upon as "the rose among languages," but, like Milton, Schuchardt evidently feels the thorns more than he sees the rose. "Anomaly is not an accident in the Aryan languages, it is much rather a part of their very nature"; and in the discussion of these points he touches upon many an interesting linguistic problem. The classics come in for a word; and we find a pupil of Kallimachus-Schneider, Rost, Marquardt, Ritschl, and Jahn, throwing his influence against Latin and Greek. Systematic grammars he dislikes, and longs for an Ollendorf in the Cymric, Irish, Magyar, and Basque languages, which last, by the by, is looked upon by K. Hannemann as the most perfect of languages, and as suitable to become the world-language.

—In the Preface to the second volume of 'Deutschlands Geschichtsquellen im Mittelalter' (3d ed., Berlin, 1887), Professor Ottokar Lorenz of Vienna has declared war against the whole army of learned German historians—against all who have adopted the critical canons elaborated and expounded by such leaders as Ranke and Waitz. The great focus of German historical erudition, the 'Monumenta Germaniae Historica,' is ridiculed. The choice of sources printed in that collection, their arrangement, and the critical principles employed in editing them, are vehemently assailed. Here are a few of his utterances: "In the case of many of the Italian sources, one carries away the impression, that, to be consistent, they ought to print the whole of Muratori in the 'Monumenta.'" "It is simply incredible in what haphazard sequence the sources [in the 'Monumenta'] are arranged. Neither a geographical nor a chronological clue guides us through the labyrinth. . . . North and South, Italian and Slavonic, spiritual and temporal territories are mingled, as in a kaleidoscope, in these great unwieldy folios." "I am convinced that, if the method employed [in editing these sources] were placed, for examination, before a commission of exact philologians of the present day, they would there find in great part the very reverse of what the philology of to-day requires." Professor Lorenz thinks that they would condemn most of the "useless stuff" printed in the 'Monumenta' to be thrust into a great waste-paper basket. "As regards the critical value of any information, too much stress must not be laid upon the proof of the time of its origin. . . . In reality it makes no difference, as regards the fact, whether contemporary information concerning it exists, or not." "Looking at the matter as a whole, we must regard it as settled that the more recent informant knows a fact better [than an earlier one], or, at least, can know it better." Professor Lorenz's fire has been returned from at least three quarters: W. Wattenbach in the *Neues Archiv der Gesellschaft für ältere Deutsche Geschichte*, vol. xiii. (Heft 2); L. Weiland in Sybel's *Historische Zeitschrift*, vol. lviii, pp. 310–335 (a very caustic and logical rejoinder); and, most recently, O. Holder-Egger, 'Die Monumenta Germaniae und ihr neuester Kritiker' (Hanover: Hahn'sche Buchhandlung, 1887). Every rational historian must agree with them in their conclusions, that the words of Lorenz contain very little truth, that he is fighting with windmills, that, in fact, the adoption of his views would undermine the foundations of historical learning. Some may go even further and conclude that the eminent Vienna professor is *non compos mentis*.

THE ORDNANCE SURVEY.

The Ordnance Survey of the United Kingdom. By Lieut-Col. T. Pilkington White, R.E., Executive Officer of the Survey. London: Wm. Blackwood & Sons. 1886.

THERE are few objects produced by what may be considered scientific labors that are more universally used and presumably appreciated than maps, and yet the number of untechnical persons, even among the most educated, who can determine the relative value of the various maps that are published, is small indeed, especially in this country. This arises partly from an ignorance of the delicacy and minute exactitude required in surveys of large areas, and partly from the want of familiar use of the finer kinds of maps that are found in older countries. There are, roughly considered, two methods of making maps. The one which is generally employed in a new country, and is the result of individual enterprises or needs, consists in making surveys of individual parcels of land, and, when they have become sufficiently numerous, combining them together to form a map of a larger area, township, county, State, or Territory, as the case may be. The other method, which must necessarily be carried on by the general Government of the State or country involved, pursues the opposite course of first determining the larger outlines of the area to be mapped, the exact position of characteristic and evenly distributed points, and of afterwards filling in the intermediate spaces, with a detail and exactitude only limited by the amount of labor and money it may be found advisable to expend thereon.

The former method is the one generally employed in a country where land is plenty and money scarce, such as ours was a hundred years ago, and is one which for a time answers the required purposes; but it is also one which in the very nature of things involves an accumulation of errors; hence, the greater the area involved the greater these errors become. As the country becomes more thickly populated and richer, and lands consequently more valuable, the loss which accrues to the community at large from the absence of an exact definition of boundaries, both natural and artificial, increases in two-fold ratio, and it is only a question of time, and of the relative intelligence of the people as represented by its lawgivers, when the second method shall be employed, and it be legally declared the duty of the general Government to provide the very best and most exact basis of maps by a general triangulation of the whole country conducted on a uniform system.

It is in some such condition as this that the United States finds itself at the present day, and it might be well for those of our legislators who have cavilled at the time and expense involved in the general and local surveys undertaken at various times and places in this country, to study the experience of our mother country, as set forth in this little volume of Col. White's, which gives a brief and, so far as may be, a popular account of the Ordnance Survey of Great Britain—a survey which has served as a model for those which have been undertaken since its inception by the various governments of Europe. Its name is in one sense a misnomer, since it has no longer even a nominal connection with the Ordnance, having always been carried on by the Royal Engineers, and having received this name because up to 1855 it was under the direction of the Board of Ordnance, a sort of quartermaster's department of the British Government, which was done away with, owing to the inefficiency it displayed during the Crimean war. Its inception is ascribed by Col. White to two engineer officers of the army, who, after the battle of Culloden, became convinced of the need, as a war measure, of a topographical map of the Scottish Highlands. It was not, however, till towards the close of the eighteenth century that the primary triangulation, the necessary substructure of any systematic survey, was ac-

tually commenced, and this great work was finally completed in 1852, some sixty or seventy years after.

The cadastral maps based upon this triangulation have followed in due course, but with increasing scale and minuteness of delineation as their value became more generally known by actual use of those already finished, until now the whole kingdom is mapped on a scale of six inches to the mile, and the more thickly settled counties and towns on a larger scale, the principal being the so-called twenty-five-inch scale, on which an acre covers a square inch of map surface, and the still larger 127-inch scale used for cities. It were impossible to enumerate all the many practical uses which these maps subserve. A cadastral map is one made for governmental purposes of land valuation and assessment, and Col. White states that 450,000 of these maps have been furnished to the Boundary Commission alone, to say nothing of those supplied to the many other Government boards and commissions, including the Geological Survey, of whose work it constitutes the indispensable basis. Moreover, under the admirable system adopted, by which certain reputable private firms are appointed Government agents for their sale, any private person can procure whatever map he wishes at a fixed price sufficient to cover cost, generally a few shillings. They are bought in enormous quantities by the general public, and their value as an educational factor alone is worth many times the cost of the survey. The number of employees of the Survey in 1885 Col. White gives as 3,240 persons, exclusive of temporary aids, such as taping boys, etc.

It may be well to consider, in this connection, what progress we have made in this country towards procuring such a map, since it is not, as some seem to think, a scientific luxury, but a practical necessity, the want of which involves to the community at large an actual annual loss far greater than its cost, enormous though this may seem when the area to be mapped is compared with that of Great Britain. The probability of our being involved in another great war seems so remote that many might question its necessity for strategic purposes, but the same argument might have been used only a short time before the late civil war; and yet how much blood and treasure might have been saved to the nation had our armies been provided with correct topographical maps of the Southern States, only those actually engaged in the conduct of their operations can realize.

There is no want of scientific ability for carrying on such a work, and of individual push and energy we have more than sufficient. A large amount of money has been spent both by State and general Governments for surveys of various kinds, and yet the results, as far as maps go, have been most inadequate and disappointing, consisting of various detached and mostly incomplete pieces of work, wanting in correlation and uniformity of system, and, such as they are, often unobtainable by the general public except through political favoritism.

The greatest work of scientific mensuration that has been undertaken in this country has been the Coast Survey, which has reflected great credit on the scientific corps that has carried it on. Within a comparatively few years its scope was widened by act of Congress, and it was authorized to extend its triangulation into the interior of the country through such States as should have a geological survey, and it became thenceforward the Coast and Geodetic Survey. The triangulation done under this authorization has been necessarily very irregular and unsystematic in its development.

Soon after the war, Clarence King, then only about twenty-six years of age, conceived the bold project of carrying a topographical and geological survey across the Rocky Mountains, taking in the belt of country to be opened up by the recently authorized Pacific Railroads. In spite of the discouraging prognostications of older scientific men, who said that Congress would never vote the funds for such a gigantic project, and that it was impracticable to carry on such a work in the arid regions of the Great Basin, his youthful enthusiasm and personal influence succeeded in obtaining a generous appropriation from Congress, which was continued year after year, and towards the end without any personal effort on his part. With the aid of a corps of scientific assistants, he so successfully accomplished the laborious task that in less than ten years the form of these mountain regions, hitherto standing on the maps as a great blank, marked "the American Desert," was mapped with an accuracy of detail entirely unknown in the thickly settled regions of the East. After two seasons' experience had proved the practicability of such work, the emulation of the officers of the Engineer Corps, under whose able chief Mr. King had been directed to work, prompted them to start a systematic topographical survey of the entire Western United States on the same general system as that outlined by Mr. King, but giving greater prominence to the topographical aspect of the work as one of military necessity. This was called the Wheeler Survey, from the Engineer officer in charge.

When Mr. King's field work was completed, his topographers were joined to the so-called Hayden Survey, which had hitherto carried on geological reconnaissances in that country without maps, and under their direction the beautiful topographical map of Colorado was produced. Two organizations were now occupied in preparing a general topographical map of the Western United States, supported by annual appropriations. Unfortunately, in spite of the great area, their work frequently overlapped; the zeal of either to outstrip the other overcame discretion, and each accused the other to Congress of doing bad work. Congress, unable to decide on the technical merits of either case, referred to the National Academy of Sciences the question whether it would not be to the advantage of the public that the geological and topographical work of these surveys should be consolidated each under one head. The recommendations of the Academy in regard to the geological work were adopted by Congress, these various surveys were discontinued, and in their place the United States Geological Survey was organized on a permanent basis, as a bureau of the Interior Department, in March, 1879.

That portion of the recommendations, however, which related to the topographical work, and which involved the consolidation of all Government organizations for mensuration of the country, the Coast, Lake, and Land Office Surveys, as well as those above mentioned, ran counter to too many personal interests in the existing Government organizations, and was stricken out from the bill before it was passed. Thus the bill in its mutilated condition provided for a geological survey, but neglected to provide for the indispensable basis of such a survey, the making of a correct topographical map of the country, while discontinuing those already in progress. The first director of the Survey, Mr. Clarence King, construed this action of Congress as an intimation that the immediate preparation of a general geological map of the United States was not desired, and directed his investigations to regions of which maps already existed or could readily be prepared. A few years after, however, the statement was distinctly made by Congress, in the annual appropriation bill, that the making of a geological map of the whole United States was one of the duties of the Geological Survey. The present director, Prof. J. W. Powell, construing this statement as an authorization to provide the necessary basis for such a map, immediately instituted a topographical survey of the whole country, compiling on a uniform scale the material already prepared by previous surveys. He also secured in some cases the coöperation of State authorities in the preparation of maps of individual States, and pushed this branch of his work so vigorously that at the present time the topographers attached to the Geological Survey outnumber its geologists.

The propriety or advisability of having two such gigantic undertakings as the topographical and geological surveys of the whole of the United States (an area, excluding Alaska, of over three million square miles), conducted by a single organization, might be questioned. It might be said that one and the same man could hardly conduct impartially, and to the best advantage, two kinds of scientific work, each requiring the very highest degree of technical ability and experience in its particular department as a guarantee of the accuracy of its results. It might be further objected that the magnitude of the undertaking is in itself a danger to a Government scientific work, since the very numerous salaried positions involved offer great temptations to bring these positions under political influence; and no good and honest scientific work can be done which is not perfectly and entirely free from any suspicion of political influence or favoritism. The best answer to any such criticisms will be the success of the work itself, and if Director Powell is permitted to carry out this great undertaking on the plan set forth by his chief topographer in a recent number of *Science* (July 29, 1887), he will have made one of the most important contributions of the century to the industrial and educational development of the country as well as to its geological study.

It may be reserved for another generation of geologists to reap the full benefits of his labors, but, were these maps accessible to the public as soon as completed, immediate practical benefit could be derived by those inhabiting the areas already surveyed, and the reproach that the school maps of this country are inferior to those of the rest of the world, might be rapidly removed. According to Mr. Gannett, 120 sheets of the map, covering an area of 250,000 square miles, or 1-12 of the United States exclusive of Alaska, have now been engraved at an average cost of $3 per square mile. Unfortunately, under the existing laws, these maps are destined exclusively to serve as the basis of a geological map, and no provision is made for their publication except as illustrating geological memoirs. Many years may elapse ere the geological mapping of these regions, necessarily a much slower work, is completed and the maps are issued. Even then they will be available only for geologists.

A leading member of Congress, when urged some fifteen years since to introduce a measure providing for the sale of Government scientific publications on the plan so long and successfully in operation in Great Britain, declined to do so, on the ground that the feeling of members of Congress, that it was beneath the dignity of our Government to enter into commercial trading, would render its passage impossible. Since that time it has not seemed to the majority of

Congress undignified for our Government to buy silver at 85 to 90 cents per 412½ grains and sell it for $1.00. Moreover, provision has actually been made in the law creating the Geological Survey for the sale of a limited number of its memoirs at cost of publication. This provision, so much desired by that large class of scientific men who, through want of political influence, had been unable to obtain such publications, works a certain injustice to the members of the Survey itself, since, no provision being made for the cost necessarily attending the sale and distribution of such memoirs, it has to be taken from the amount appropriated for scientific work, and no corresponding pecuniary advantage can inure to the Survey, as all sums received from such sales must be covered into the Treasury of the United States.

It seems, therefore, that a great benefit would be conferred upon the community at large by the passage of a bill providing for the sale not only of these maps, but of all Government publications which may be of interest to the public at large, at cost of printing and material used; and, further, that a given number of responsible booksellers at the principal centres of population should be designated as Government agents to conduct the details of such sale, and authorized to add a reasonable percentage to the cost sufficient to remunerate themselves for the labor and expense involved. This increase of cost to the public would be more than offset by the increased facility in obtaining such works, and the members of the various Government departments from which they proceed would be relieved of an irksome and often ungrateful task.

SAINTSBURY'S ELIZABETHAN LITERATURE.—II.

A History of Elizabethan Literature. By George Saintsbury. Macmillan & Co. 1887.

MR. SAINTSBURY'S remarks upon Shakspere will seem to some extreme in their praise; yet on the whole they strike us as containing many of the best observations in the book. Even here, however, he seems not to comprehend a position he is attacking. We are not arguing for the correctness of the German claim, that it was they who taught the English to understand Shakspere; but it is surely just to have it fairly stated. They—at least those of them entitled to speak with authority—have never taken the ground which is here vehemently assailed. What they maintain is, not that Germany taught England to admire her greatest author, but that it was Lessing and his school who were the first to point out that Shakspere was not an inspired barbarian, and that the qualities in him which his countrymen were wont to apologize for were the very ones of which they ought to be proud. It is no reply to this to say that Ben Jonson and Dryden admired him and that Pope and Dr. Johnson edited him. Ben Jonson said, also, that "Shakspere lacked art." In that brief sentence he compressed the criticism about the poet which was dominant in England for nearly two centuries. It can be found more or less plainly manifested in the writings of all the authors who have just been mentioned. From that idea the German school has always been free; and it early set out to show that art was the quality by which Shakspere was supremely characterized. Its claim to have originated this view of the poet may or may not have foundation in fact; but, before being denied, it deserves at least to be comprehended.

We have no space to comment upon several other points which betray errors of conception if not errors of fact. It remains to say a few words about the treatment of the period as a whole. It is a period of preëminent interest in English literature, and the difficulty of discussing it satisfactorily is necessarily increased by the limited scale on which the work is planned. Mr. Saintsbury has still further increased this inevitable difficulty by adopting the theory that, in order to understand the literary history of a period, "it is necessary to study the minor as well as the major illustrations of it"—which of course can only mean studying a small portion of the minor illustrations of it. He has therefore given much space to the inferior men whom the literary resurrectionists of later days have from time to time dug up, but have never succeeded in reviving. Yet, with all this, he has failed to indicate the grand central characteristics which mark the period he describes. Perhaps it would not be unjust to say that he has failed to see them. In that period the literary aspirations of men found their expression in the drama, just as in the age of Anne and the first Georges they did in the essay, just as they now do in the novel. The drama was the national literature. Its weakness and its strength were alike due to that fact. Everybody tried to write for the stage who could write at all, just as everybody now tries to write a novel. The result was, at times, as distressing in the one case as it is in the other. But the drama had this advantage as a national literature over both the essay and the novel, that it could make use of the double vehicle of prose and poetry, but especially of the latter. In the hands of a man of genius it could reach the highest elevation, for it could embody itself in the highest form of literary expression. But from poetry the novel of this century and the essay of the last have been practically divorced.

Because the Elizabethan drama, as the national literature, voiced the feelings and aspirations of the time, the result inevitably followed that everything which sought to interest or to influence men was apt to take upon itself that form. Politics, religion, personalities, atrocious crimes—every event that was talked about or thought about—was brought upon the stage. The period cannot be understood without having this fact clearly in mind; but there is nothing in this volume to show that Mr. Saintsbury has ever heard of it. He has devoted three pages, for instance, to "Gorboduc," and yet has not observed that this so-called first English tragedy is nothing but a pamphlet in disguise, that its aim is primarily political, and only in a limited sense literary. Its object was to persuade the Queen to marry, and to settle, by the results of marriage, the succession to the throne. It was a matter of supremest consequence to English Protestants at that time to have an heir apparent of the right faith while such an heir presumptive as Mary Stuart was in existence. If other proof were needed of the fact, the speech of the Counsellor *Arostus*, with which the tragedy closes, would settle the question decisively. The character of the piece was naturally decided to a great extent by the political motives that prompted its composition, and not by any conscious attempt to introduce into our tongue tragedies modelled after Seneca.

The fecundity of the Elizabethan drama, with all that results from it, was likewise due to the fact that it was the national literature. Of this Mr. Saintsbury has scarcely taken note. Yet it was something inevitable in a period when everybody wrote for the stage, when plays had no run whatever in the modern sense, and when (originally, at least) they were never even acted on successive nights. Most of the literature of this sort has perished, but there is plenty of proof that its production was enormous. This is something that implies much more than it says. Mr. Saintsbury looks down in a superior way upon the harmless drudges who delve in what "some moderns call the 'Bio-Bibliographical' side of the matter"; but if he had taken the pains to consult so common a work as Henslowe's 'Diary,' he would have seen clearly many things which he now sees dimly or does not see at all.

Take the case of Decker, a dramatist he admires. By collating the references in the work just mentioned, he would find that between the beginning of 1598 and the end of 1602, that author produced ten entire plays of his own, wrote in conjunction with others twenty-nine, and made additions to and alterations in half-a-dozen more. Thus, during the space of four years, he was concerned to a greater or less extent in the production of about forty plays; yet of these forty, if we can judge from the titles, only four appear to have survived. This is far from being a singular instance. The faults of the Elizabethan drama are largely due to the fact that it was almost always written hurriedly, written against time. To that is due much of the crudeness and imperfection that mark it—not anything peculiar in the character of the men or of the period. But the subject is too vast to be much more than indicated in this place.

Of Mr. Saintsbury's critical estimates we purpose to speak only in general terms. These touch matters upon which no two persons will ever agree, and each has a right to his preferences. There is much, however, found here that will exact respect even when it does not command assent. The author's views are those of a man who not only has a firm faith in his opinions, but has generally good reasons to show for his faith. There are paragraphs and even long passages which strike us as of the highest merit, and that, too, when with the views set forth we should have no sympathy. But here, as elsewhere throughout the work, there is another side to the shield. Against the places mentioned are to be set Mr. Saintsbury's occasional mighty admirations for petty men and petty productions, his capacity as a professional critic of finding inimitable what the rest of the world looks on as being simply endurable; and, worse than all, that bias of judgment which is the result of importing politics into literature. The death of King Charles secretly troubles Mr. Saintsbury's head as much as it avowedly did Mr. Dick's. It leads, perhaps unconsciously, to extravagant statements, and gives to some of his remarks a tone unsuited to literary history. The current critical jargon which does so much valiant duty for ideas, reaches perhaps its highest possible climax of absurdity in speaking, as is done in this volume, of Milton's "middle-class Philistinism" (p. 389). Such a phrase recalls the wish expressed in Wordsworth's famous sonnet that Milton were living at this hour, and leads one to feel the truth of his words, "England hath need of thee"—for she has become a fen of stagnant literary waters indeed.

It is necessary to talk plainly in this matter, because it is evident that Mr. Saintsbury has little idea of the toleration of which no one stands more in need than himself. There is sometimes a sad, and sometimes a scornful, pity expressed for those who do not share his sentiments. Of course, you are ignorant, or, if not ignorant, you are dense, or some other one of those epithets in the use of which the bumptiousness of literary criticism finds supreme delight. For Mr. Saintsbury takes himself

very seriously. He possesses plainly the fullest conviction that when he has spoken, the last word has been uttered. Very rarely does he admit the existence of any lingering doubt in his mind that he has penetrated to the inmost citadel of truth. Once, indeed, he does seem to hesitate—but it is for a moment only. This is in his remarks upon the question whether the primacy in English poetry is to be accorded to Spenser, or Milton, or Shelley. Shakspere is, of course, excluded from consideration, or, in Saintsburian speech, he is put aside as "*hors concours*" (p. 93). In regard to the comparative merits of these three he confesses that the reader has a right to demand his opinion. He recognizes the momentous consequences of his decision. But while he feels the gravity of the situation, he meets it manfully. He has, as he assures us, "no intention of shirking the difficulty." Therefore, after balancing the merits of the three poets, he determines upon the whole to give the palm to Spenser. To most of our frivolous race, all this will seem supremely comical. There are those, possibly including Mr. Saintsbury, who will look upon it as an act of "derring-do," worthy of the Red-Cross Knight himself. Shelley is too great a genius to be made permanently ridiculous by the antics of his unskilful admirers, whose performances have already largely contributed, and are likely long to contribute, to the gayety of nations. This, serious as it purports to be, is perhaps the most entertaining of any yet produced. We frankly confess to a suspicion that nobody would have noted the absence of Mr. Saintsbury's opinion on the matter if he had left it out, and that nobody will be much impressed by it now that he has put it in—unless it be some outraged fellow-devotee of the Shelley cult.

JAMES'S MANCHURIA.

The Long White Mountain; a Journey in Manchuria. By H. E. M. James. Longmans, Green & Co.

MANCHURIA, a name unknown to the natives, and coined by the French geographers from the vague term Manchau, was that part of the Chinese empire lying north of Corea and China proper, and between Mongolia and the Pacific Ocean. The Russians have helped mightily to make the term definite, and to rectify the frontiers with a science of which they are masters. First securing Siberia, they succeeded, during the Crimean war, in planting outposts on Chinese soil, and then, in 1860, claimed the occupied territory, which was in area as large as France. Ignatieff, seizing his supreme opportunity when China was helpless and the British napping, added this vast domain to the Czar's empire. China lost her outlet in the north Pacific, while Russia gained new seaports, and Corea a dreaded frontager. Manchuria now means that portion of the Chinese empire between Mongolia and the Russian maritime province of Primorsk; or, in Chinese view, the three provinces of Shing-King, Kirin, and He-Lung Kiang; that is, about one-half of the old region.

For ages Manchuria has been the breeding-ground of nations. In this land of mountains, rivers, glens, and grassy plains, fertile, healthful, and well-watered, have originated those various peoples called Ta-tars, or tributary tribes. Here have dwelt the ancestors of the Coreans and Japanese, the Huns, Turks, and Manchius. Once vassals of the Middle Kingdom, they have turned successful rebels or victorious conquerors. With almost the regularity of a law of nature, the roving and scattered tribes, acting under some obscure impulse, would consolidate and move southward into China, westward into Europe, or eastward into Corea or Japan. In different ages, and speaking varying dialects, these emigrants from the north Asian highlands would take or receive different names; though each wave of humanity was but another overflow of the same geyser-like spring whose rhythm forms the ethnic history of the oldest continent. Despite the Great Wall, first built to keep back these hordes, China has been again and again invaded, conquered, and governed by foreigners. In every case, however, the pen and letter have been in the long run mightier than the sword and spear. China has been able to tame, civilize, and educate her oppressors, and more than once overthrow the alien and reinstate a native dynasty. The last outburst from the north was that of the fierce Manchius who in 1644 conquered the whole empire and people, and imposed on every head that mark of subjugation, the queue. The Chinese, in turn, educating and civilizing their conquerors, have imposed their language on their rulers, and are now about to absorb all Ta-tar land. In this way, Manchuria has been alternately filled and depleted. Unlike previous movements, the emigration is now from the south. The new north-land is, to the crowded Chinese empire, what Manitoba and Australia are to Great Britain. So great is the pressure of population and so valuable the farms, that "the neutral strip" of fifty miles bordering Corea, unoccupied and palisaded off for 200 years, is now blooming with gardens and grain fields, while Chinese towns of brick and wood on the Yalu enjoy a good river trade. As the Chinese farmer rises at two A. M., works till dark, and goes to bed after supper in order to be in the field at the first croak of the raven, the waste "no-man's land" of a century ago is now a granary. Under the plea of abolishing the increasing brigandage, China was in 1874 just to Corea and generous to herself, and, in imitation of Russia, added this strip to her territory.

Of the three Manchurian provinces, Shing-King and Kirin are the most fertile, and abundantly stocked with horses, cattle, swine, and grain. The latter condensed into pork is transportable on the hoof, and the droves of pigs going southward are a noticeable feature of the roads. About one-third of the grain is further reduced in the still, and, as whiskey, serves to keep society from becoming too quiet. Evidently, from what one gathers from Mr. James's account, a railroad, when built, will pay dividends. The area of Manchuria is about 260,000 square miles, equal to Austria-Hungary, and larger than Texas. Its population is reckoned at from 20,000,000 to 30,000,000. Partly because of the immediate pressure and even menace of Russia, and partly from the sentimental necessity of holding inviolate the ancestral home of the imperial dynasty, the Pekin Government keeps this frontier most carefully guarded. The forts are armed with Krupp's cannon, and the rifles are of the latest and costliest pattern. Yet along with breech-loading repeaters, often rusty, the soldiery still cling to the bow and arrow; and the extravagant use of banners—survivals of the old lines of beaters and archers in the royal tiger hunts on the mountains—impedes soldierly movements, and furnishes jest to the Cossacks. Outside the towns and cities, despite the generally settled life and safe condition of the roads, the brigands are still able to earn a fair living and occasionally death by cangue and mutilation. Better roads, coinage, and government are still needed.

This information, with a clear, compact, and informing résumé of recent Chinese history, domestic and foreign, is furnished in the first six chapters of the work before us, which really comprises two books in one. The author, H. E. M. James, of the British Civil Service in India, is evidently accustomed to obtain and handle statistics and present them in readable form. His style is pleasing and straightforward, and combines qualities which make his book the best on the subject. A thorough-going "Britisher," he is very apt to build morality on revenue, and heartily believes in and defends the opium trade. He is fond, too, of flings at Americans, of whom he has the usual knowledge gained in *Punch*, in English novels, and possibly in the hotels and on railway cars.

At chapter vii he begins the story of his journeyings, and we enjoy the flavor of personal adventure. After years of desk-work in Bombay, he was fortunate in securing a fellow-traveller in Lieut. Younghusband, and the two resolved on exploring a land which they suspected the map-makers dreamed of rather than surveyed. Further, the Long White Mountain, the centre of Chinese and Corean myth and poetry, had never been ascended by a European. Their journey, in 1886, was made on pony and mule. Concerning the latter beast, Mr. James has much to say. One familiar with men and mules on the Raritan and Lehigh tow-paths will declare that between these and the Manchiu variety there is surprisingly little difference. Geographically at antipodes, they possess those original and peculiar touches of nature that make the whole world kin. Of course there is a difference in the Englishman's and Yankee's way of telling a funny thing, but the mule in Mr. James's pages amply corrects any tendency to dulness. Despite midges and gadflies outdoors, and mosquitoes and cockroaches inside, the travellers, in full physical health, and well fortified with insect-powder, enjoyed every hour. Like ships that in strange seas sail over islands, cities, and land which the unrevised map declares ought to be just there, but which are not, the travellers easily and unconsciously passed over the "chains of snowy peaks, from 8,000 to 10,000 feet high," which even the maps of the Royal Geographical Society still preserve on paper. They found, instead, chains of volcanic hills from 3,000 to 8,000 feet high. This highest figure was reached only by the lordly peak called by the Manchius Shan Alin, by the Coreans Pék-tu (White Head), and by the Chinese Chang-peh Shan, or Long White Mountain. In addition to its interest in physical geography, legend locates here the miraculous origin of the founder of the imperial Manchiu dynasty. A pure virgin, bathing in the Dragon-Prince's pool in the crater-top of the mountain—of which a beautiful colored picture is given as the frontispiece of the book—conceived from eating the red fruit dropped by a magpie, the bird now held sacred by the Manchius. To the child born of this virgin, the sons of Heaven trace their line. From this pool also, according to tradition, issue the rills which form not only the Sungari, but also the Tumen and the Yalu, which, if true, makes Corea an island. Despite having lived on Manchurian pork and beans, and thus economized, the travellers' provisions failed, and for their stomachs' sake they were obliged to take the back track without fully solving this problem. The adjective "long" in the mountain's name refers either to time or distance, and that of "white" most probably to the general color of the rocks and gravel rather than to the snow which covers the ever-white peak only a portion of the year.

The author's journeys into the other provinces, and into Russian territory bordering the Pacific Ocean, allowed him to study the Cossacks, and especially the Coreans, who in late years have so numerously emigrated across the Tumen. His narrative, besides great interest to the student, the would-be traveller, and the missionary, has value to military men. His powers of observation are excellent, and his very interesting paragraphs on religion, superstitions, archæology, natural resources, household equipment, inn and caravansary life, mule behavior, and many other subjects, tempt us sorely to quotation. Meeting most of the Scotch and French missionaries, he gives his sympathetic judgments of them and their work, and in crisp sentences the results of his conversations with them. As a popular and accurate description of Manchuria, we heartily commend this book, which, in mechanical outfit, has a dress worthy of its sterling contents. Print, paper, binding, map, illustrations, index, and furnishings are of the best.

THE DICTIONARY OF NATIONAL BIOGRAPHY.

Dictionary of National Biography. Edited by Leslie Stephen. Vols. XII–XIV. Conder–D'Eyncourt. Macmillan & Co.

THE reviewer has often to contrast his own slowness in reading, pondering, and expressing judgment, with the rate at which a work like this Dictionary is put through the press. Certainly we should have been prompter with these volumes if we had had anything further to say in praise of one of the best edited, as it is one of the most useful and important, enterprises of the kind known to our day and generation. We have, we believe, turned every leaf of the series thus far, stopping to read and to enjoy, and we have grounds for saying that the editor and his staff have maintained a remarkable evenness of execution and justness of proportion, and above all a spirit of simple truthfulness which becomes the more impressive the more one makes himself acquainted with the contents. Doubtless we owe a great deal of this excellence to Mr. Stephen himself, in whom these literary and moral qualities are conspicuous, and whose articles (collectively, the best in the Dictionary) are models for all his colaborers. He has known, we may be sure, how to exclude what was irrelevant or inflated, and to insist on the compactest rendering of essential facts, without barring out characteristic and enlivening anecdote such as abounds in these volumes, and makes them companionable for the idle as for the serious hour.

We have heretofore called our readers' attention to the fact that this Dictionary not only supplies for the great British worthies biographical sketches unsurpassed in length, or in authority, or in literary grace, by those in the best cyclopædias; it also most properly and helpfully records the lives of a vast middle class whose names either never get into the dictionaries at all, or are inadequately and briefly dismissed. One cannot exaggerate the help thus afforded the student of every branch of human activity, and particularly of English literature. Nowhere else, for example (annotations apart), exists such a convenient and satisfactory biographical complement to Pepys's and Evelyn's Diaries, to Boswell's Johnson. We have also pointed out the interest which Americans have in this Dictionary, especially in the case of the founders of the several colonies, but also all along the line down to the present time. Not only are we concerned with the Rev. John Davenport, the head of the New Haven settlement; with Stephen Day, the first New England printer; with Thomas Danforth, Deputy Governor of Massachusetts and first treasurer of Harvard College; with Copley, the artist, and his more renowned son, Lord Lyndhurst (both native Bostonians). Dampier, too, "that bold sea-rover," who took a breathing spell between his piracies in Virginia; Captain Cook, who skirted our Pacific coast; General and Admiral Cornwallis, our foes in the Revolution; the Royalist De Lanceys; the Earl of Stair, who opposed in the Lords the making war on the colonies; Dr. Thomas Cooper, friend and follower to America of Priestley, and defendant in one of our famous state trials as the libeller of President John Adams; Sir John Compton, who got into diplomatic hot water for recruiting soldiers for the Crimean war in a land lately bent on buying "Hungarian bonds"; "Fanny" Wright (Mme. Darusmont), an original experimenter in slave emancipation, and forerunner of woman's rights; George Frederick Cooke, the actor, whose body lies buried in this city; Sir Samuel Cunard, son of a Philadelphia merchant—these and many others touch our history in various memorable ways. Shall we not add Darwin to the list, through his American friendships, and notably with Asa Gray?

The first volume of this Dictionary was published in 1885, but a wise discretion has permitted the introduction of persons whose death occurred after that date. Thus, Samuel Cousins, the engraver, died in 1887. It is curious to observe that Edward Dutton Cook, here commemorated as having contributed the dramatic and theatrical lives in A to the first two volumes, died in 1883, before they appeared. The greatest names in the three volumes before us are Anthony Ashley Cooper (first Earl of Shaftesbury), the poet Cowper, Cranmer, Cromwell, George Eliot, Cruikshank, Curran, Dalton, Darwin, Sir Humphrey Davy, Defoe, and De Quincey. Of minor importance, if not all less known, are John Douglas Cook, founder of the *Saturday Review*; Sir Wm. Fothergill Cooke, joint inventor of the telegraph with Wheatstone; George Crabbe; John Wilson Croker; Crompton, inventor of the spinning mule; Cruden, of the Bible Concordance, whose career was a very singular one; William Cumming, the pioneer in modern ophthalmology; Dallmeyer, the optician; Grace Darling; Thomas Day, author of 'Sanford and Merton,' and perhaps the most amusing character not devoid of nobility to be met with in these pages; John T. Delane, editor of the *Times*; and the Chevalier D'Éon. Mr. Stephen has reserved for himself Cowper, whose name he remarks that the poet himself pronounced Cooper, whose letters he regards as the best in the language, and whose poetry, he thinks, has been best judged by Sainte-Beuve; Crabbe, in whose favor, intellectually considered, he cites some eminent and weighty admirers, including the late Edward Fitzgerald, yet seems to approve his "system (less common than might be wished) of periodical 'incremations'" of his voluminous MSS.; George Eliot, who is rather briefly treated, but with marked discrimination; Defoe; and De Quincey, on whose best work and his English style Mr. Stephen bestows the highest praise. All these articles can be read with the greatest profit, and should be accessible in every library in the land—to say nothing of "every gentleman's library," whither this Dictionary should find its way, even if merely in recognition of so laudable and costly an enterprise.

We have not examined these latest issues for errors, but we will instance one in the sketch of the eminent philanthropist, James Cropper, whose death occurred in 1840, not, as stated, in 1841.

What I Remember. By Thomas Adolphus Trollope. Harper & Bros. 1888.

MR. TROLLOPE is not quite an octogenarian; but, as he says, he has "lived a long time," and his memory has stored up a great deal of interesting information gleaned from many lands and in contact with many distinguished persons. He has had no adventures and shared in no great events; his life has been essentially a private one, with considerable literary work in it and a large portion of social enjoyment; he owes more to his circumstances than to himself for what makes his recollections worth publishing, and hence the subject of this volume is not so much his own autobiography as the people and the things he has observed. The controlling influences of his own career were his parents. His father made the earlier years gloomy with his misfortunes and his bad temper, though the son speaks of him always with respect for his strong qualities and with affectionate condonement of his weaknesses; and his mother made his literary future possible for him, and gave it direction. We already know the family from his brother Anthony's account; and, while he endeavors to soften the harder lines of that narrative, and particularly to mitigate the passages descriptive of his mother's last years, he leaves us with substantially the same impression of the character of the family. Mrs. Trollope was the capable head of it, and after her journey to America had proved profitable in the unexpected way of making her famous, she was its real support. The sketch of her, however, writing novels on a diet of green tea and laudanum, attending meanwhile to her dying son and her impracticable husband, is one that excites commiseration; and, after the worst of her ills were gone by, her journeys in search of material for volumes of travel, and, finally, for a place to settle in for the remainder of her life, are far from being cheerful to contemplate. The life of her son was happier. Probably, even in what seems to us his dreary school days at Harrow and Winchester, and his hardly more fortunate sojourn at Oxford, he had more pleasure than the reader would think possible; and after he had failed to find his calling in pedagogy, and had settled on the career of a literary hack in Florence, he thought himself very well off. He was twice married, and in the retrospect regards his lot as a felicitous one; and this contentment with what he has been and has enjoyed, diffuses through the pages a cordial and optimistic spirit which is the chief ingredient in the pleasure his story affords.

The narrative is principally made up of unexciting anecdotes, and the best of these are about eccentric persons, notable in their little communities, but not known beyond them. Trollope was a traveller, in a sense, for most of his life, since he spent it mainly in Italy, and naturally saw many people in whom only his eyes took interest. From America he brought back little or nothing except a hospitality for things American, but in Paris he saw Chateaubriand and in Vienna Metternich, and in Italy he formed acquaintance with Dickens, the Brownings, George Eliot, Lewes, and Garibaldi. He brings to mind the curious state of literary Paris at that time when his mother wrote of Victor Hugo, "I might say that of him France seems to be ashamed," and he testifies to "the absolute truth of the above representation of the prevalent Parisian feeling at that day respecting Victor Hugo." He repeats the remark of Metternich that "the most unpleasant part of the circumstance connected with dealing with Napoleon arose from the fact that he was not a gentleman in any sense

of the word, or anything like one," and adds that of course Metternich was not thinking of the matter of birth. He prints several letters of the English nobilities mentioned above, but they have no interest, intellectually or personally. A jaunt with George Eliot into the mountains north of Florence, and some glimpses of Mrs. Browning, are the best he has to relate, and the singular fact that Landor, of impeccable English, dropped his aspirates, is the only striking reminiscence of that great literary name. Garibaldi he saw once alone, when the General made an early morning call on him before he was up, and he describes the appearance of the hero in his red shirt, gray trousers, and foraging cap, with great particularity, even to the fine lines round his eyes and the steady far-away gaze of their clear blue orbs. They talked of Italy, "of course": "'As for the priests,' said he, 'they ought all to be put to death, without exception and without delay.' 'Rather a strong measure,' I ventured to say. 'Not a bit too strong, not a bit,' he rejoined warmly. 'Do we not put assassins to death? And is not the man who murders your soul worse than the man who only kills your body?'" Afterwards he saw Garibaldi at the end of his career in Palermo, when he was borne through the crowded streets on a litter, and all the people stood silent for fear of exciting him with their shouts. But of the Italian Revolution he has really very little to say.

The reader of these pages, however, as has been indicated, must not look for anything very novel, exceptional, or striking. It is a book of gossip, of conversation made public, memories of the ways and the look of old London, and the unreformed schools, of Paris and Brittany, Vienna in the days when the city wall protected aristocratic society, of Florence and Lucca and Modena in the times of the Grand Dukes, with their queer little courts and receptions at which the guests, even the English, filled their pockets with fowls and hams and jelly with busy and open hands, the Americans alone refraining; and all this world is far enough away now to have the attraction of manners gone by. One bit that is of literary interest here we find in connection with Sir George Musgrave, whose character is admirably drawn. He is the owner of the Luck of Edenhall, and, though a careful man, insists on his guests handling freely the magic goblet, in order that the "Luck" may have some meaning. A footnote informs us that he once "picked a crow" with Longfellow for representing "the 'Luck' to have been broken, which Sir George considered a flight of imagination quite transcending all permissible poetical license." Other similar trifles there are which we might readily select, but we have given a taste of the plums, and the reader can better suit his own palate for himself. He will not weary in Mr. Trollope's company if he makes modest demands, and has an interest in human nature in its eccentric and grotesque forms—especially if he is a judicious skipper.

Addresses (Educational).—Uppingham School Songs and Borth Lyrics.—Poems and Translations. By Edward Thring, (late) Headmaster of Uppingham School. London: T. Fisher Unwin.

By the death of Rev. Edward Thring, the distinguished Headmaster of Uppingham School, England has lately lost the most conspicuous figure which has appeared in her school world since the time of Arnold. He is the only English schoolmaster of the present generation who can be said to have exercised a distinct influence on educational thought outside of England. His 'Theory and Practice of Education,' reviewed in these columns five years ago, has had a wide circulation in America. Though based on English experience, its vigorous dealing with the fundamental problems of education appealed to earnest thinkers everywhere, and many an American teacher would acknowledge a deep debt of gratitude to Mr. Thring's pages for stimulus and inspiration. What he preached about school work and organization in his books, Thring tried to realize in actual fact in the great school which he created, and over which he ruled for more than thirty years. Of the scope and direction of his work at Uppingham not much has hitherto been known in America, but an article on the subject is, we understand, soon to be published by one of our foremost popular magazines, and doubtless in due time some record of his strenuous life, with its aims and accomplishments, will be given to the public.

From the preface written by his daughter, we learn that the manuscripts for the three new volumes of his writings which are the subject of this notice, were placed in the hands of his publishers only a few days before he was seized with the illness which proved so suddenly fatal in October last. We are also told that the two volumes of verse were more particularly intended for the boys, past and present, of Uppingham School. Part of this verse has something more than a local significance, to which reference will be made hereafter, but a wider interest will be felt in the seven addresses on educational subjects which make up the larger volume. One of these, written by request for the Teachers' Association of Minnesota, and read before that body, will have a special interest for American readers. Two deal chiefly with the question of women's education, and the other four with general aspects of the great teaching problem. In all these addresses, teachers will find much strong and stimulating food for thought. They are not calculated to induce complacency with accepted methods and popular ideals of education. Thring's whole life was a fight against cramping tradition on the one hand, and, on the other, the tinkering interference of State-appointed amateurs with the skilled teacher and his original power. None was more ready than he to cast aside the deadness and narrowness of old systems, but to have the dead hand of official routine applied to the schools of a country seemed to him a greater danger still. To him, all true education is life acting on life; and throughout these addresses we find a steady protest against influences which in school work hinder the freedom of this action. Too much external control, too much inspection, with its fixed patterns and standards, excessive competition, the idolatry of prize winning, the stuffing of the mind with mere masses of knowledge—all these interfere with the healthy development of life power.

"Like all other high arts, life must have free play or there can be no teaching." "Teaching and examinations are deadly enemies as soon as examinations cramp the liberty necessary for teaching." "A few fragments of knowledge, acquired at the cost of blunted hope, and loss of power, and false ideas of life, and no skill, and no eye for skill, are not worth the cost."

Mr. Thring points out that in a busy, democratic century, which will be satisfied with nothing short of universal education—a century, too, which has seen a greater expansion of the facts which make up the sum of human knowledge than all previous ones put together—the educational problem takes new forms, and that we cannot rightly deal with it unless we have regard to its actual data. This is the pregnant way in which he summarizes them for the teachers of Minnesota:

> "All are to be taught,
> And knowledge is infinite.
> And life is short,
> And average brains are weak,
> And few have time to spare,
> And time is short even to them."

To grapple with this problem, he urges that we must first "smash up the idolatry of knowledge," and let the aim of our education be primarily to call out thought and strengthen mind—in his opinion a higher and entirely different process from putting in knowledge and heaping up facts. We cannot make every mind a comprehensive receptacle of knowledge, but we can and ought to give to the average mind intelligent skill in the use of its own powers. Mr. Thring lays great stress upon the necessity that honor to lessons should be shown by the rooms in which they are given. "Life and death," he says, "can depend on a room. Christianity itself cannot lodge large families in one room in a civilized country and remain Christian. The Christianity either breaks up the one room into many, or the one room breaks up the Christianity." So, after describing the ordinary schoolroom with its shabbiness, its "walls bare, unsightly, and grimy, or grimly austere with maps and blackboards," he adds that "it is hard to escape something of the pig if lodged in a sty. The schoolboy has not escaped, and never will, till 'Honor to Lessons' is the first article in the nation's secular creed. Everything that meets the eye ought to be as perfect, according to the work and workers, as human skill can make it." In this connection a strong plea is made for more attention to pictorial teaching, with its power of leaving vivid impressions, and suggestions are given for making the decoration of schoolrooms serve high educational purposes.

Perhaps we could not better illustrate the prevailing spirit of these vigorous addresses, which we trust will find many American readers, than by quoting one final passage: "The true definition of a teacher is, 'one who sows seeds of life and fosters them.'" It was in trying to realize this definition in his own life work that Thring became the greatest English schoolmaster of the present generation.

We have only space left to refer very briefly to the volume of verse entitled 'Uppingham School Songs and Borth Lyrics.' Matthew Arnold, in one of his critical essays, remarks that "the future of poetry is immense." The volume before us certainly suggests one vast field of influence which our poets have left as yet almost untouched. The man or woman who could cast the occupations, trials, temptations, and dreams of the schoolboy's life into the furnace of poetic thought, and give us songs glowing with true poetic fire, and strong to stimulate and inspire the young, has before him a whole world which even genius might well feel proud to conquer. Mr. Thring's efforts in this direction are an interesting study. The high and pure sentiment which marks all his verse is seen not to be incongruous with hearty sympathy for the boisterous energy of youth.

Wedded to the music which he cultivated so assiduously as a part of his school system, these songs must have had a healthy and inspiring influence on the boys for whom they were written. As we have said before, most of his verse in these two small volumes is of local interest, but in the attempt to idealize the round of school life, as in many other things, he was a pioneer, and one whose example is worthy of study and emulation.

Impressions de Théâtre. Première Série. Par Jules Lemaitre. Paris: Lecène & Oudin.

M. LEMAITRE has here collected some of the dramatic feuilletons which he contributes every Monday to the *Journal des Débats.* A second series of the same papers is to be published about this time, and even then the two volumes will be only a selection from the *Lundis* which have been appearing without interruption since the latter part of 1885. A few of those in the present volume belong to that year, two-thirds of the remainder to the next, and the other third to 1887. The feuilletons are grouped according to subjects and without regard to dates; they are seldom reprinted entire, but the portions given seem to be republished as they at first appeared, without alterations or additions. Even in their original form, many of these papers were not so much dramatic criticism as fine and delicate literary appreciation of the authors and the works under consideration, and a few lines at the end were all that M. Lemaitre gave to the theatrical performance which was the occasion for his remarks. Frequently the greater part of the feuilleton was occupied by a criticism of some newly issued volume or article, which, whatever its subject might be, became dramatic under his treatment.

When M. Taine published his two famous chapters on Napoleon in the *Revue des Deux Mondes,* and later when Prince Napoleon replied to them by his volume, 'Napoléon et ses détracteurs,' M. Lemaitre made one of his most amusing and most dramatic *Lundis* about each publication. These were as sparkling and lively as if some comedy had given rise to them, and at the same time they were full of profound literary penetration and judgment. He not only presented the two writers under the most unexpected and varied aspects, but lightly and without pretension made some of the most sensible and brilliant criticisms upon them that have been brought out by M. Taine's daring portrait of the great Emperor. M. Lemaitre always writes from a literary and philosophical point of view. He compares a play of George Sand with one of Alfred de Musset acted upon the same stage in September, 1887, and the theme of his argument is in the differences between the romantic and the poetic drama. He writes concerning the ballet—there is a group of half-a dozen articles with this heading at the end of the volume—and behind the dramatic critic there appears at every turn the artist, the poet, the scholar, and the philosophical thinker. The wealth and variety of M. Lemaitre's critical faculty is nowhere better shown than in these last papers. The one on the Ashantees at the Jardin d'Acclimatation, dated September, 1887, is perhaps the most brilliant, and excited the most comment at the time; but all, with their half-paradoxical method of presenting new views or old ones under new and fresh aspects, are full of matter for reflection.

This many-sided critic has his limitations and incapacities which are not the least interesting revelations of his personality. Some of the feuilletons in which he treats of Shakspere show this in a very marked degree. The one on the adaptation in French verse of "Much Ado about Nothing," which has recently been represented for some months at the Odéon, is an instance. In these, however, he confesses that he is judging from an entirely French point of view, and it is at least doubtful whether he really feels as incapable as he represents himself to be of appreciating what seems to escape him.

The Voyage of the Fleetwing. By C. M. Newell. 12mo, pp. 443. Boston: De Wolf, Fiske & Co. 1888.

IT is an old remark that the matter of a good book is more important than its style, but Captain Newell would have done well to remember that without an effective style the best matter is thrown away. Here is abundant material—the adventures of an old-fashioned whaling cruise; but the author has told his story in a manner which does it great injustice. Similar scenes are described with wonderful power and felicity in Herman Melville's 'Moby Dick,' the classic story of whaling adventure; and it is with work like this that Captain Newell's present story (as well as an earlier one covering similar ground, and called 'Pehe Nui') must challenge comparison. As a story of exciting adventure based upon large experience of whaling life, Captain Newell's 'Fleetwing' has great reality; but its effect is sadly marred, not to say destroyed, by faults of obscurity or excess in the telling. Least of all can a story-teller afford to dispense with the literary element in his work. 'Peter Parley's Universal History,' after fifty years of use in American schools, remains in great demand; it is now a popular text-book in Japan, and is one of the most profitable of school-books, and why? For a reason not very generally known, namely, that 'Peter Parley's History' was written in chief part by Nathaniel Hawthorne. And if style tells in the school-book, much more does it tell in a story. Captain Newell's recital of perils and adventures is full of life and go, but it lacks the one thing needful; boys will read it, but the crudity of its style will close its pages to maturer readers. It is only those who already have knowledge and interest in the subject that he describes who will take an interest in the book.

BOOKS OF THE WEEK.

Abbot, Gen. H. L. Defence of the Sea-Coast of the United States. D. Van Nostrand.
Allen, W. Governor Chamberlain's Administration in South Carolina: A Chapter of Reconstruction in the Southern States. G. P. Putnam's Sons. $3.
Ballard, H. H. Three Kingdoms. Handbook of the Agassiz Association. Writers' Publishing Co.
Bankside Shakespeare. Edited by Appleton Morgan. New York: Shakespeare Society.
Beecher, W. C., and Scoville, Rev. S. Biography of Henry Ward Beecher. Chas. L. Webster & Co.
Bigelow, J. The Complete Works of Benjamin Franklin. Vol. VII. G. P. Putnam's Sons. $5.
Blackwell, Prof. J. S. Manual of German Prefixes and Suffixes. Henry Holt & Co.
Boggett, Wm. Key to the Mysteries of Water, Electricity, and Heat. London: Trübner & Co.
Booth, Rev. H. M. The Sunrise, Noonday, and Sunset of the Day of Grace. A. D. F. Randolph & Co. $1.
Buck, J. H. Old Plate, Ecclesiastical, Decorative, and Domestic. Gorham Manufacturing Co.
Cameron, Mrs. H. L. A Life's Mistake: A Novel. Philadelphia: J. B. Lippincott Co. 25 cents.
Chaucer, G. The Knightes Tale. Clark & Maynard. 12 cents.
Cook, Rev. J. Sermons Preached in St. Andrew's Church, Quebec. Montreal: Dawson Bros.
Custer, Mrs. E. B. Tenting on the Plains. Chas. L. Webster & Co.
Dabney, Prof. R. H. Causes of the French Revolution. Henry Holt & Co. $1.25.
Deighton, K. Shakspere's Much Ado about Nothing. Macmillan & Co. 60 cents.
Dimsdale, M. S. Livy. Book XXI. Cambridge, Eng.: University Press; New York: Macmillan.
Dods, Rev. M. The Book of Genesis. A. C. Armstrong & Son. $1.50.

Fine Arts.

THE ACADEMY EXHIBITION.

THE sixty-third annual exhibition at the Academy of Design contains 598 works in all. Only seventeen or eighteen of these are sculptures. The current exhibitions of American art are all alike in this respect, consisting almost entirely of pictures, and what few examples of the sculptor's art they may include are placed at random in the picture galleries, and are not even thought important enough to have a separate department in the catalogue. The present Academy exhibition, however, though the display of sculpture is comparatively meagre, shows a marked advance on its predecessors, in the superior quality of at least three of the pieces of sculpture which it contains. We refer, of course, to Mr. St. Gaudens's two works, and Mr. Warner's excellent bust of Mr. Alden Weir. The latter, which is here shown in bronze, was exhibited in plaster some years ago, if we mistake not, at one of the exhibitions of the Society of American Artists. It is well worth seeing again in its present form, in which its simplicity in the treatment of details and its fine ensemble are admirably expressed in the severer material. Mr. St. Gaudens's appearance as an exhibitor at the Academy is the most promising sign of the long-looked-for improvement in this the oldest and best-known of American exhibitions; and the presence of his two works, "Bust of General Sherman," No. 597, and "Portrait of a Lady—Medallion," No. 598, is of itself enough to make the sculpture exhibition a notable one. The distinguishing characteristic of the bust of Gen. Sherman is virility. It is, above all else, manly, firm, and vigorous. Granting that the sculptor was fortunate in his model, the treatment of this head calls for particular notice as to the way in which the characteristic is expressed. Here, as in the Lincoln, the sculptor has had to deal with a head which in no way suggests the classic ideal, and which has yet such a strong personality, such an individual style, that it produces very much the same impression of grandeur in looking at it as one receives from some of the antiques. In this treatment of an American type Mr. St. Gaudens was eminently successful in the Lincoln, which differs, however, from the bust of Gen. Sherman in having the whole figure with its fine, large lines to give it a reposeful feeling—one of the best things about it—while the head of Gen. Sherman is all moving energy. The firm-featured visage of the soldier, even in such details as the wrinkles in the brow and the creases in the weather-beaten cheeks, and the stiff beard and hair, is reproduced with fidelity; yet details are so well subordinated to the ensemble that a breadth of mass is obtained which is rare enough in portrait busts to be especially mentioned here. The simple handling of the collar, and the excellent effect given by the half-raised lapels of the military coat, set the head off well, and the pedestal, with its laurel bordering cleverly incorporated in the design, is fitly proportioned.

In the "Portrait of a Lady" Mr. St. Gaudens has made a delicate relief in marble of a lady with a bridal veil. The figure is about one-third life size and three-quarter length, and is tastefully framed in a wooden plaque of creamy white, which accords with the colder tones of the marble. In these days of mere prettiness and over-elaboration of stuffs, which are such prevalent vices in what sculpture comes to the United States from Italy, it is worth noting that in this work of Mr. St.

Gaudens, in which he has to deal with just such a subject as nine out of ten Italian sculptors of our time would be sure to make a botch of, he has treated his subject with a simplicity that forms its greatest charm. It is conceived and carried out in harmony with the tenets of the modern French school, with a certain delicate grace of his own which always makes itself felt in Mr. St. Gaudens's work of this class.

"Portrait of a Lady," No. 260, "Venetian Street," No. 213, and "Venetian Interior," No. 219, are three works by John S. Sargent. It is Mr. Sargent's first exhibition at the Academy, and it is a most brilliant début. Those who remember the portrait of a young lady in black with a rose in her hand, exhibited by Mr. Sargent at the Society of American Artists in 1883, or the two portraits of an elderly gentleman and lady in the Society's exhibition at the Metropolitan Museum in 1886, and retain the impression of quiet dignity made by contemplation of them, will perhaps receive something very like a shock at the first glance at the "Portrait of a Lady" at the Academy. The other portraits were reserved; this one is aggressive. In the former works, ease and grace were united with the most skilful painting; in this later one we find restlessness and a sort of brilliant dash, with painting quite as skilful as before, but with less of absolute truth to nature. The head, which is the principal thing of course, is quite the best part of this portrait, for the arms are none too well drawn and none too well modelled, and, like the chest, have more of the false brilliancy of chalk or powder than the clear luminosity of a white skin covering palpitating flesh. But the head is fresh in color and thoroughly alive. One may not like over-well the treatment of the whites of the eyes, which are startlingly white, nor the cherry-red *tache* of the under lip, and one may object that simplicity is in these parts of the painting of the head pushed too far; but it is well to remember that the artist must have determined to sacrifice something of subtlety in order to obtain such brilliancy of effect. Brilliancy is the quality which best describes this portrait, and it is a brilliancy most becoming in this intensely modern piece of work. It has the air of modernness which pervades the drawing-room without a trace of the studied ceremony of the court; it is an attractive head that grows more and more real and living as you look. Considered purely from the point of view of the technician, it is one of the very cleverest things of the year's art.

Of the two Venetian pictures, though there is much delicacy of observation and subtile painting in the picture of the street, with its graceful figures, of the girl, whose pink dress is partly covered by her clinging black shawl, and the men at the doorway, we find more solid merits than these in the "Venetian Interior," No. 219. This picture of a sombre room, with its group of girls stringing beads in the foreground, is the work of a veritable artist. It is so essentially a work that appeals to those who are capable of appreciating art purely for its own sake, that it seems out of place on the Academy walls, where there is so much that is disturbing by comparison. Admirable in its quiet color scheme, full of atmosphere, and delightfully painted throughout, it is one of those pictures whose charm never fades and of which one can never grow weary.

Mr. Chase, whose absence has been remarked for a decade at the Academy, makes a strong and representative exhibition this year. One portrait, a charming head of a young lady, in a dress of pink, which is notable for sympathetic drawing and delicate contrasts of color, is "Portrait of Miss B.," No. 214, and another, a seated figure of an elderly lady seen in profile. Dignified, of excellent style, and showing the artist's appreciation of quiet tones and his ability in harmonizing the figure and the costume, with the accessories, in a complete ensemble at its best, is the "Portrait of Mrs. G.," No. 337. Besides these are three small out-of-door works of scenes in the neighborhood of Brooklyn, excellent in the rendering of things as they are and the picturesqueness of the suburbs of the city: "Rotten Row—Brooklyn Navy-yard," No. 112; "Summertime," No. 298; and "Peace Scene—Fort Hamilton," No. 350.

"Portrait of Mr. John Gilbert," No. 381, by J. Alden Weir, is an excellent canvas, and one of the best portraits Mr. Weir has exhibited of late. And "Portrait," No. 12, seems to possess fine qualities of color, and to be a complete and artistic picture of a lady in a costume in which a dusky yellow is the principal color note; but it is placed in the most garish light in the galleries, and suffers from juxtaposition with some of the canvases which, of all those that might be found in the exhibition, are least suited to the subtle tonality of Mr. Weir's work. There are numerous portraits in this exhibition, more than fifty in all, and, as is usually the case, some of the best work on the walls, as well as some of the worst, are to be found in them. There is good drawing and painting in the small portrait of a gentleman, No. 540, by Montague Flagg, and much solidity of modelling and unity of effect in "Portrait of Prof. Barker of the University of Pennsylvania," No. 405, by Thomas Eakins. "Portrait of Miss Dora Wheeler," No. 286, by Amanda Brewster, is the only out-of-doors effect in portraiture worthy of mention in the exhibition, and it is placed so high that its sterling merit can be but half appreciated. It is simply painted and agreeable in color, and of excellent style. "Portrait of Alexander Hamilton," No. 156, and "Portrait of a Lady," No. 456, are characteristic works by Eastman Johnson, and "Portrait of Mr. David Dudley Field," No. 114, by Robert Gordon Hardie, is an excellent full length in the "official" style in which the painter has successfully followed the somewhat conventional methods of some of Bonnat's work. A three-quarter length of a lady in black, "Portrait," No. 310, by Frank Fowler; a three-quarter length of a lady in a gown of dull orange hue, "Portrait," No. 582, by W. M. J. Rice; and a portrait of a lady with a fur robe and long gloves on her hands, "Portrait of Mrs. E. M. H.," No. 362, by Wyatt Eaton, may be fitly mentioned together with these in closing a somewhat long but excellent list. It is one of the best features of the present exhibition that room has been found for so many good portraits, and a convincing sign of progress in Academy traditions.

Quite the most remarkable picture in the exhibition, and the one which is most impressive as the work of a strongly individual talent, is "Eight Bells," No. 370, by Winslow Homer. This picture of two seamen on the deck of a coasting vessel, quadrant in hand, taking the noon-day observation, the figures painted in sunlight with a heavy blackish sky of breaking clouds, and the rolling waves green and white-capped, forming the background, is painted in Mr. Homer's usual robust manner. The effect of the glinting sunshine as it flashes on the wet timbers of the ship and the wet oilskins of the sailor men is realistic to a degree, and has a rare look of truth. Compared with his "Undertow" of last year, it possesses all the qualities that made that picture so remarkable, yet in both composition and the purely technical side of painting it is a distinct advance on it. Mr. Homer now stands in a place by himself as the most original and one of the strongest of American painters.

In marked contrast to the rugged and at times heavy technique of Mr. Homer's work is the delicate and elegant composition by Mr. H. Siddons Mowbray of a receding group of fairy figures floating gently and with rhythmic movement over a grassy meadow that stretches away to distant hills gilded by the rays of the setting sun, "Evening Breeze," No. 433. To the task of thus depicting ideal figures and investing them with the look of motion in the air, Mr. Mowbray has brought his well-known talent as a draughtsman, and has painted these dainty sprites in the most charming arrangement of harmonious tints. It is a bit of dreamy fancy "materialized" on canvas with a technical precision that is delightful to behold, and it is safe to say that nothing more charming in imaginative art has been seen at the Academy.

Mr. T. W. Dewing, whose work is nothing if not refined, contributes a small picture of a lady in a yellow dress. The figure is seated in a chair, and is seen in profile. "Lady in Yellow" (No. 417) is the title, and the picture contains nothing further than what is indicated in the name. Even the chair is almost hidden from view by the ample skirt of the flowing yellow robe. With so simple a subject, however, Mr. Dewing has made one of the best pictures of the exhibition. Its charm lies in its very simplicity, and the artist has brought all his skill to bear in the expression of the charming head. It is drawn with admirable delicacy, and is tender and full in color. It is impossible to describe the charm of the well-poised little head and the sweetness of the gentle face.

Mr. Robert Blum brings from Venice a striking picture of "Venetian Bead Stringers," No. 355, which represents a half-dozen girls in many colored dresses sitting at work in a court-yard, a white wall with green shutters on the windows behind them. The picture has many excellent qualities, and is notably good in drawing. It is brilliant and gay in effect without being gaudy, a fault it might easily have if the subject were painted by a less cultivated colorist than Mr. Blum. The picture abounds in good *morceaux*. "Their Pride," No. 364, by Thomas Hovenden, is quite the best of recent pictures, with subjects taken from negro life, painted by this well-known artist. It is an interior with a number of figures, and these, as well as the room and its furniture, are broadly and solidly painted. The effect of atmosphere is well felt, and the canvas is a complete one as regards composition and arrangement of light and shadow. Other prominent figure painters worthily represented in the various galleries are J. Carroll Beckwith, who contributes an excellent "Head," No. 142, which is well constructed and luminous in painting; Edwin H. Blashfield, whose picture called "Improvisatrice," No. 442, shows a three-quarter-length figure of a girl with an antique stringed instrument in her hands; Francis D. Millet, whose single figure of a young woman in Greek costume of white standing on a marble terrace, with her delicately outlined head in relief against dark-foliaged trees in the background, makes a charming picture, and is called "On the Terrace," No. 297; George De F. Brush, who exhibits a well-conceived composition depicting a scene of Aztec life and customs, called "The Sculptor and the King," No. 222, which is remarkable for accuracy of drawing and careful execution; Francis C. Jones, whose picture, "The Favorite Grandchild," No. 261, is a well-painted interior with three figures,

in which the light is cleverly disposed; Irving R. Wiles, whose "Shady Lawn," No. 205, is a study of out-of-doors effect on landscape and figure marked by much truth of observation; Will H. Low, who contributes in "By the Fountain," No. 488, one of the few nudes in the exhibition, and one which is both refined in sentiment and soundly painted; Herbert Denman, whose small picture of a single figure of a young girl, "The Window Seat," No. 211, is a fresh and delicate bit of color; and William T. Dannat, who exhibits a strongly painted study of a Spanish girl in black, "Castanet Player," No. 277.

In landscapes there is a large and on the whole excellent showing. Mr. Inness is represented by one of the best of his recent works, "A September Afternoon," No. 449, a handsome canvas, powerful and subdued in color, and of the finest decorative quality with its rich tones of browns and pinks, and its puissant notes of deep blue in the sky. Mr. Gifford is seen at his best in a winter landscape of a frozen river, snow-covered hills, and dull gray sky, "On the Harlem." No. 311, and Mr. Tryon shows some of his most subtle qualities of painting in "A Pasture, October," No. 152, and a fine effect of sky and water in "Clearing after a Storm—New Bedford Harbor," No. 204. "A Rhode Island River," No. 138, by R. W. Van Boskerck, a large canvas with a river whose tree-covered banks are reflected on its surface, and a summer sky with warm tinted clouds, is strong in color and effective in its ensemble. "The Late Moon," No. 223, by Kenyon Cox, is an effect of moonrise on the shore of a lake, in which the peculiar orange light of the moon when it comes above the horizon only when the night is half gone, is excellently rendered, and in which the midnight sky of blue, tinted by the reddish golden light of the moon, is truthfully painted. "November Woods," No. 538, by Ruger Donoho, a wood interior with dead leaves thickly scattered among lichen-covered rocks—a realistic and straightforward piece of painting; "On the Moors," No. 410, by Robert A. Eichelberger, a simply composed and soundly painted picture; "A Winter Morning in the Catskills," No. 504, by Dubois F. Hasbrouck, a realistic transcript of morning sunshine on the snow in a pine wood; and "White Frost," No. 23, by H. G. Dearth, a well-painted effect of early winter, are other landscapes which should be mentioned among the good things in the exhibition. Mr. Shurtleff exhibits a picture called "In October Woods," No. 148, which has superior qualities of color, and is of his best work. Mr. Murphy, with "The Yellow Hour," in which we find the harmonious color scheme and the enveloping atmosphere which characterize his landscape work; Mr. Crane, with "Morning in June," No. 525, a bright and freshly painted picture, full of sunlight, and with a luminous and atmospheric sky; and Mr. Dewey, with an excellent work, "A Pasture Lot," No. 365, are well represented, and Mr. Edward Gay is seen at his best in a large picture of "Waving Grain," No. 526, in which the effect of light inundating the rolling fields, and the sunshine glittering on the billowy expanse of standing wheat blown by the wind, is realistically given. "On the Bozen Kill," No. 529, by Walter L. Palmer, is one of those effects of sunlight on snow which Mr. Palmer has been painting lately, and is one of his best; and "Westchester Hills," No. 400, by Homer D. Martin, is a large landscape in which the painter has been notably successful in the treatment of his subject by simple means and breadth of handling. "Evening," No. 141, and "Morning," No. 191, by Horatio Walker, are two pictures of landscape and cattle which deserve special notice, and "Fox Hounds," No. 434, by H. R. Poore, is a group of dogs which are excellent in character and remarkable for frank and direct methods of painting.

The pictures are much better hung than is usual at Academy exhibitions, and the general effect of the galleries is as complete and harmonious as it is possible to attain when the incongruous elements which necessarily compose the exhibition is taken into consideration. Both the Committee on Selection and the Hanging Committee are to be congratulated on their success in making the present exhibition the best the Academy has ever held.

HISTORICAL FICTION.

The "Quarterly Bulletin of the Mercantile Library of Philadelphia" contains a chronological list of Historical Novels arranged by countries. In the numbers issued America, England, Scotland, Ireland, France, Spain, and Italy have been covered. The "Bulletin" is mailed, postpaid, for 20 cents a year.

SCHOOL BOOKS IN FOREIGN LANguages. Miscellaneous Books in Foreign Languages. Catalogues on application. Foreign Periodicals.
Carl Schoenhof, Importer, 144 Tremont St., Boston.

Houghton, Mifflin & Co.'s
NEW BOOKS.

Before the Curfew,

And Other Poems, Chiefly Occasional. By Oliver Wendell Holmes. 1 vol., 16mo, beautifully printed and bound, gilt top, $1.00; a limited number of the first edition, cloth, uncut edges, paper title, $1.50.

This tasteful volume contains the poems written by Dr. Holmes during the past eight years, since 'The Iron Gate' was published. They have the same freshness, wit, pathos, fitness to the occasion, felicity of phrase, and all the other charming qualities which have made his previous books an unfailing delight.

Metrical Translations and Poems.

By F. H. Hedge, D. D., and Mrs. A. L. Wister. 1 vol., 16mo, parchment paper cover, $1.00.

Dr. Hedge and Mrs. Wister have brought together in a tasteful little book the best German poems they have both translated into English verse, to which Dr. Hedge has added some excellent original poems.

The Puritan Age and Rule

In the Colony of the Massachusetts Bay, 1629–1685. By George E. Ellis, D. D., President of the Massachusetts Historical Society, author of 'The Red Man and the White Man in North America,' etc. 1 vol., 8vo, $3.50.

Dr. Ellis is distinguished as one of the most competent and diligent students of American history, especially of the Colonial era. In this volume he gives the results of his researches and studies concerning the motives which prompted the self-exile of the Puritans and the grounds on which they exercised their arbitrary rule in Massachusetts. Directly or indirectly the book challenges statements and criticisms which have appeared in some recent volumes dealing with the Puritans.

R. A. WALLES,
164 La Salle St., Chicago, Ill.

The Nation.

NEW YORK, THURSDAY, APRIL 26, 1888.

The Week.

THE opening speech of Mr. Mills, Chairman of the Committee of Ways and Means, on the Tariff Bill, on April 17, was a clear and incisive statement of the leading issue now before the country. Mr. Mills opened his argument with a sledge-hammer blow at the fiscal policy which the Republican party, by successive steps, has fastened upon the country, whereby the whole burden of the national Government has been thrown on consumption as distinguished from property and income. The internal-revenue taxes that have been successively repealed were taxes on property. Thus have been thrown off from time to time—first the tax on manufactures, then the tax on income, then the stamp duty, then the taxes on corporations, on patent medicines, on perfumery, on bank deposits and bank checks. "In 1883 they finished this magnificent shaft, which they have been for years erecting, and crowned it with the last stone, by repealing the internal tax on playing cards and putting a 20 per cent. tax on the Bible." This is epigrammatic, but it is also true to the letter, and is illustrative of the whole course of Republican tax and tariff legislation, the whole aim and drift of which has been to put the burden on the backs of the people as consumers, and not as property-owners. This is the issue that the Republicans have to meet in the coming campaign. The "pauper labor" argument with which they seek to meet these facts was likewise handled by Mr. Mills in a masterly manner, by showing that the rate of wages has very slight relation to the tariff, but is governed by the law of supply and demand.

Judge Kelley, who was promptly put forward by the high-tariff men to answer Mr. Mills, made the fatal mistake of descending to particulars. The Judge's strong point is mouth-filling oratory of the "hi-falutin" order, like his famous appeal a dozen years ago for the silver dollar as the money of Abraham, Isaac, and Jacob—the money with which the cave of Machpelah was purchased. Such an orator is almost sure to make a fatal slip the moment he comes down to the level of facts and figures, and Judge Kelley's latest speech is no exception to the rule. To take a single illustration: he cites Kentucky as a State which suffers from the slavery of the whiskey trust, and to establish his point says: "In 1880 the number of her people above ten years of age who were reported by the census as unable to read and write, was more than one-half her total population. That number was 606,578." Any person who has ever given any attention to the statistics of illiteracy will recognize at a glance that there is some frightful blunder here, and become curious to learn how it was made. The census gives the number of persons above ten years of age in each State "returned as unable to read," and the number "returned as unable to write." The latter class, of course, always includes and exceeds the former, since a good many people can read who cannot write. For Kentucky the totals are: "Unable to read," 258,186; "unable to write," 348,392. It is obvious that the number unable to read *and* write is also 348,392; but Judge Kelley, applying a peculiar high-tariff method of computation, says: There are 258,186 persons unable to read and 348,392 unable to write; to find out how many cannot read *and* write, add the two classes, and you have 606,578.

The division on the Fishery Treaty in the Senate Committee on Foreign Relations, and the refusal of the majority to discuss it in open session, serve to relegate that question decisively to the domain of party politics, along with the general tariff question. This is the place where all competent observers were sure that it would fall, sooner or later. Rejection of the treaty is now part of the Republican creed and platform, while ratification is equally part of the Democratic creed and platform. This we cannot fail to regard as a misfortune to the nation, but it was inevitable from the moment that the fishing interest was consolidated with the other interests protected by the tariff. As a two-thirds vote of the Senate is required to ratify any treaty, it is almost certain that the Fishery Treaty will be rejected. But a majority vote can put fish on the free list, and this is what is sure to follow in the course of a very few years if tariff reform gets a fair start in the present Congress. Meanwhile, the irritation that has existed during the past two years respecting the fishery dispute has been much quieted by the negotiation, and it will consequently be much easier to keep the peace than it has been heretofore. For so much we ought to be thankful.

The Democratic majority in Louisiana proves to be so overwhelming that there is not the slightest doubt as to the result, and consequently there is no chance for another controversy such as raged in 1876 and would have followed a close contest now. It is agreed on all hands that a fair election was had in New Orleans. "The election in this city was absolutely free and fair," says the *Tribune's* correspondent. The same correspondent says that the majority for the Democratic State ticket in New Orleans is about 16,000, which is almost exactly the same as at the corresponding election four years ago. At that time the Democratic State ticket had 45,000 majority in the whole State, and it is said that this time the figures will reach 65,000. It is claimed by the Republicans that in many parishes outside of New Orleans the Democratic managers at the polls swelled the majorities for their party by fraudulent counts, and there is every reason to credit the charge, for such cheating has long been the habit of both parties in Louisiana; but there is not the slightest reason to doubt that the Democrats carried the State by a substantial majority on an honest count.

The best feature of the election is the defeat of the notorious ring which has long controlled and disgraced New Orleans. The victory was due primarily to the Young Men's Democratic Association, which organized the fight, and secondarily to the Republicans, who expected partisan advantage as well as the public benefit in fomenting the division among their opponents by refraining from nominating a ticket of their own and by supporting the bolters. The result shows that the most downtrodden and ring-ridden community can throw off the yoke of the bosses if it really tries, and that the worst evils finally work their own cure. If the charges of ballot-box stuffing in the country parishes are true, that evil also must be left to run its course until it becomes so bad that local sentiment insists upon a reform. This will never be brought about by Northern demagogues legislating at Washington.

The Ohio Republican Convention on Thursday went through the motions of adopting a resolution "presenting" John Sherman for the Presidency, and directing the four delegates-at-large elected to the National Convention to use all honorable means to secure his nomination. By skilful management, any open outbreak of the strong opposition to Sherman's nomination, which lay just below the surface, was suppressed, and the Senator must have drawn a long breath of relief when he found that a controversy over his candidacy had been avoided, even if he does not feel very enthusiastic over the sort of support which he received. The Convention also made nominations for the State offices to be filled next fall, and adopted a platform which must, of course, be accepted as Mr. Sherman's idea of the appeal which the party should make to the country in the national campaign. It consists of three important planks—a demand for legislation regarding Southern elections of the "Force Bill" sort; an appeal for the maintenance of the present war tariff, with denunciation of any suggestion of tariff revision as "free trade"; and a call for extravagant pension legislation. That a candidate for President should suppose that the country can be carried on such a platform, shows most amazing blindness to the signs of the times.

We suppose it will amaze our diverting but over-serious friend, Mr. G. W. Smalley, the London correspondent of the *Tribune*, to hear that his florid account on Sunday of the regret which Englishmen would feel in parting with Minister Phelps, is likely to injure Mr. Phelps, but it is nevertheless true. If Mr. Smalley could get away a little oftener from his Norfolk

estates and his duties as a county magistrate, and visit this country more frequently, and mix with the inhabitants in a familiar way, he would discover that nothing damages an American Minister in London so much with a certain class of our politicians as the news that English society likes and respects him; that he is a welcome guest and orator at public dinners, and that his opinions have weight with cultivated Englishmen and women. The kind of American representative they would like to see in London is a brutal fellow who knows nothing worth mention, reads no books, and takes no part in conversation except to boast of American products, or to remind the company of the Revolutionary War and the cruise of the *Alabama*, and spends his leisure roving round London in search of pumpkin pie, pork and beans, and buckwheat cakes. Consequently, whenever any testimony comes over the sea that the man who represents the American people in London is considered by the best judges in that capital a gentleman and a scholar, their eyes roll in patriotic frenzy, and they begin to clamor for his dismissal as a disgrace to the nation. For the truth must be told —Mr. Lowell alluded to it sorrowfully in his recent address—one of the consequences of the appearance of "Labor" in our politics is the notion that "the true American" must be removed as short a degree as possible from the aboriginal inhabitants of the country, in dress, manners, and mental outlook.

There are to-day 2,500 men, formerly in the employment of the Chicago, Burlington and Quincy Railroad at large wages, living in idleness, with families to support and on the borders of destitution. The company has filled their places, and the business of the road is going on as usual, and the community is rapidly forgetting them, while they are trying to console themselves by the childish delusion that they are out "on strike," or, in other words, that they are exerting some kind of pressure on the company. In a week or two more they will probably wholly disappear from the public gaze, break up their little homes, and scatter all over the country in search of "a job," leaving their wives and children to bear the heartache of hope deferred, and to see their savings vanish in procuring a scanty subsistence. Now, these men are not the victims of their own folly solely. Their sufferings are due in large part to the encouragement given by the press, by philanthropists, and social philosophers of various persuasions, to the extraordinary doctrine that when once you get into another man's service, you have a right to stay in it as long as you please, on terms fixed by yourself, and to worry him into acceding to these terms by damaging his business in any way that will not expose you to criminal prosecution. There is only one claim in the history of mankind equal to this in absurdity, and that is the claim that, having got a man into your service, you have a right to keep him in it as long as suits you, on terms fixed by yourself, and to flog him whenever he tries to leave it. The latter was known as slavery of the laborer, but the other is slavery, too. It is just as much slavery to have to hire a man against your will as to be hired against your will. Everybody who resists compulsory employment is really defending human rights just as much as the man who resists compulsory service.

A very amusing correspondence between the Rev. Dr. MacArthur of the Baptist Church and Father Young of the Paulist Fathers has just been printed. It appears that Dr. MacArthur wrote an article in a religious magazine—the Chicago *Standard*—in which he said he had been told, "in a prolonged conversation with a prominent priest connected with the Paulist Fathers," that one difficulty in introducing congregational singing (into the Catholic Church) was that "the great majority of their people could not read the hymn if it were printed and placed under their eyes." Father Young "called his attention" to this, and asked him if he wrote it. Dr. MacArthur would not say till he saw the magazine. Being shown a copy of the passage taken from the magazine, he said he could not tell whether the copy was correct, but if Father Young "had any correction to make," the editor would doubtless insert it, and he, Dr. MacArthur, had "the highest respect" for all Paulist Fathers. Being shown the magazine itself, he admitted that he wrote the article, and said his assertion about the story told him by the "prominent priest" was true, and that he had once said the same thing himself about the colored Baptists of the South, and was ready to publish Father Young's denial next week. Being asked to name the Paulist Father who told him the story, he omitted to do so, but "modified his statement" in the Chicago *Standard* by "saying that an official of the Church by implication contradicts the truth of the statement," and at the same time "thanked God that the days of the Inquisition were over." Father Young must see by this time that he had to deal with a practised "journalist." No professor of the art in any seat of learning could have met the attack more dexterously. Nothing, for instance, could surpass the attempt to distract the enemy's attention by throwing him "the colored Baptists of the South" to be gored, or the final introduction of the Inquisition, with its attendant horrors, so as to associate Father Young in the minds of the audience with that detestable institution and occupy them therewith, while Dr. MacArthur was making his escape.

With the death of Dr. Agnew, there passes from the scene the last survivor, except Prof. Wolcott Gibbs, of the once famous U. S. Sanitary Commission to which army and nation were so much indebted during the war. Mr. George T. Strong was the first to go; he was followed by Dr. Bellows, then by Dr. Van Buren, and now by Dr. Agnew. The only other active worker of the organization on the Atlantic Coast now surviving is, we believe, Frederick Law Olmsted, the Secretary, at present resident in Boston. Prof. Newberry of Columbia College was prominent in it, but in the West, and Miss Louisa Lee Schuyler of this city conducted an auxiliary organization formed by women. All but the members of the parent body have vanished, and, strangely enough, they have all died of somewhat similar diseases. Dr. Agnew was, we think it may be safely said, the most active and energetic of them, and, though the youngest, his counsels were certainly not the least valuable. A better citizen New York has not had for many a day—one more public-spirited, more willing to pay with his person in all attempts to promote the general welfare, wiser in conception, more vigorous in action, or more sympathetic with everything which makes for purity, order, and progress. The pity of it is that he has been cut off when his experience was ripest, his influence greatest, and when men whose patriotism was elevated and stimulated by the war are becoming very scarce.

However well Mr. Chamberlain may be getting on with the Tories, his success with his own old party seems to be very moderate. He is known in England as the inventor of the caucus, which he was the first to introduce into Birmingham under the name of the "Liberal Association," or the Two Thousand, the members of which are elected from the various wards of the city. At the recent election his Unionist candidates were beaten out of sight, and the Gladstonians now hold the Association by a large majority. This was more than Mr. Chamberlain could bear, and he announced that he would withdraw from the Association altogether, and set up another of his own, which would be more select and contain only really nice men.

Mr. Chamberlain has, since he got home, disposed of American opinion on Gladstone's plan for Home Rule in amusing but characteristic fashion. He says, in very odd English:

> "I mixed with representative men of all parties, of all classes, and of the different nationalities of which the people of the United States is composed; and with very few exceptions I could find hardly one who approved the policy of Mr. Gladstone or the bills which he introduced."

He added that the small minority, the "hardly one with very few exceptions," did not understand it. A better way than this of disposing of people who do not agree with you does not exist. But we venture to assert that this was also true of those who agreed with Mr. Chamberlain. We are very certain that "hardly one of them, with very few exceptions," understood the Gladstone bill or the Irish question either. The story, let us say, would be more credible if Mr. Chamberlain could get the majority of the Liberals of his own town to agree with him about the Gladstone plan. A majority of these, too, whose opinions on the Irish question are to him vastly more important than those of Americans, do not concur with Mr. Chamberlain. Can it be that they also do not understand the Gladstone plan?

Bradlaugh, the English Radical, has made a good reputation within a very short time as a man who "knew what he was talking about," by his carriage of his Oaths Bill in the House of Commons, and by his maintenance of charges of corruption which he brought against the Corporation of the city of London. But in accusing Lord Salisbury of giving a check to promote Radical meetings in Trafalgar Square when the Liberals were in power, he has overshot his mark, and has been mulcted in $1,500 of damages, besides costs. He was already heavily burdened with debt on account of the costs in the litigation arising out of his attempt to keep his seat in the House without taking the oath, and has no means of livelihood except lecturing, and, had not some of his colleagues immediately come to his relief, he would have been in a bad way.

M. Leroy-Beaulieu has a trenchant article in the last number of his paper—the *Économiste Français*—in which he enumerates the several causes that have brought about the pending crisis in France. Some of them are very ludicrous, but some in a startling way remind us of things we have seen in this country. Speaking of the duration of the various Cabinets since 1880, he says they used to last eighteen months, then a year, then six months, then a quarter; and they have now got down to thirty and fourteen days. While they are in office, "the little men," as he calls them, of course cut all sorts of capers. There was one wag (*jovial garçon*), he says, who used to amuse the Chamber a good deal by his drolleries; so he very soon was made Minister of a little Department of Agriculture, which was constructed especially to please the farmers, who were complaining bitterly of low prices. As soon as the wag got into office, he found that the Administration of Forests, which has existed in France for 200 years, and is charged with the protection of the forests, was prosecuting vigorously a large number of depredators on the public domain. Of course, they complained bitterly, and as they had votes like other people, the wag accommodated them by abolishing at one stroke of his pen the whole forest service. How vividly this recalls the savage attack made in the Senate by James G. Blaine in 1877 on Secretary Schurz under exactly similar circumstances. Mr. Schurz was engaged in saving the Government timber lands in Montana from wholesale devastation by private plunderers. Instead of supporting or encouraging him, Mr. Blaine came to the rescue of the thieves, and abused Mr. Schurz roundly, reminding him that he was of foreign birth, and that the country he was born in was smaller than Montana. Now, if our Constitution had been like the French one, Schurz and the Cabinet to which he belonged would in all probability have been driven from office in order to gratify the criminals.

M. Leroy-Beaulieu's remedy for all this tomfoolery is that the French voters should do what is done in England, and America, and Belgium when the party in power mis behaves—turn it out and put the other party in. As the Radicals have made a dreadful failure, the proper thing to do now, he says, is to turn the Government over to the Conservatives and let them try their hand. The trouble is, however, that the Republicans are afraid that if the Conservatives got into power they would restore the monarchy; so, for want of anything better, they are thinking of trying Boulanger and a "revision of the Constitution." Many of them fancy that if they can only get rid of the Senate, they can never be unhappy again. This, too, bears a striking resemblance to the state of mind of the Republicans in this country before 1884. They were prepared to put up with everything from the Republican jobbers sooner than try the other party, because, they said, as sure as the Democrats got into power they would repudiate the national debt, pay the rebel debt, compensate the slaveholders for their slaves, abolish the tariff, and establish "British free trade." As long as this delusion lasted, all healthy political progress was impossible. The election of Cleveland broke the spell, and restored the old Anglo-Saxon remedy for the abuses of power to its former place in the popular mind.

The ministerial crisis in Holland, which has found its solution in the formation of a Mackay Cabinet, was a natural consequence of the recent elections, the first held under the revised Constitution and the new electoral law. The principal changes made in the existing law were, first, a considerable reduction in the property qualification and the admission of large classes as electors, independent of any property qualification; second, the abandonment of the system of large electoral districts. Except in a few cities, no district now elects more than one member. The result of these changes might have been easily foreseen. In the south the Catholic clergy is supreme, and a solid phalanx of Ultramontane members was returned. In the north the small farmers, who constitute a large proportion of the new electors, are almost to a man adherents of the "anti-revolutionary" or strict Protestant party. In order to oust the Liberals from power, the leaders of that party, sacrificing all their traditions, formed a close alliance with the Catholics, who in many districts form a strong minority. Their lack of political principle did not stop even with this. They did not hesitate to make common cause with the Socialists, as was shown by the publication of a circular of the Central Committee which was intended to remain secret. The demoralizing spectacle was given of a party whose fundamental principle is devotion and loyalty to the House of Orange, voting solidly for a man, Mr. Domelu Nieuwenhuis, who had been recently sentenced to a term of imprisonment for seditious speeches and treason, in order to secure the support of the Socialists in other districts.

The combined Clericals were successful in the rural districts, and had it not been for the fact that the Liberal party, waiving all dissensions, made a stubborn and organized fight, they might have made great gains even in the large cities, because among the lower middle class, which for the first time exercised the electoral franchise, they have a large number of adherents. As it is, the Liberals were victorious in Amsterdam, Rotterdam, Utrecht, Arnhem, Dordrecht, and Leyden, and the majority of the combined but antagonistic Clericals over the united Liberals is a narrow one—54 to 46. Moreover, as the elections for the Senate (the members of which are elected by the States of the different provinces) have resulted in a victory for the Liberals, so that in that body they now have thirty-four seats out of fifty, the tenure of office of the new Clerical Cabinet may not perhaps be a long one.

The message of President Diaz at the opening of the April session of the Mexican Congress is, in the main, as dull reading as the proverbial annals of a fortunate nation. Its most important items bearing upon American relations to Mexico are the announcement of a great success of the parcels-post system, instituted last July, and the statement that a convention has been signed between the two Governments for the submission to their respective Congresses of a project to admit, mutually, natural products free of duty. Two matters of great public interest in Mexico, to which allusion might have been most properly made in the message, are conspicuous by their absence. One is the absorbing political question of Presidential reelection, and Gen. Diaz's personal attitude upon it. He passes it all by in absolute silence. This might be interpreted, in view of the seven distinct and solemn declarations against reëlection which he has publicly made in the past eleven years—the last one no longer ago than his message to Congress of April, 1885—as but the dignified silence of a man whose position had been made known with sufficient clearness. More probably, however, it is a natural reluctance to eat his own words unnecessarily; that action can be much more gracefully performed after the "spontaneous demand of the country" has made itself heard, as it is expected to do next fall. The other important matter of public concern about which the President omitted to speak, except in the vaguest terms, is the new national loan. He simply said that the Treasury would lay a copy of the contract executed in Berlin before Congress at an early day. This is in keeping with the obstinate silence of the *Diario Oficial* on the same subject, and does not exactly foretoken the great triumph of finance which we have heard so much about. Meanwhile it appears that the national bank is pressing the Government for payment of its many loans, or, possibly, only of defaulted interest on them, and has secured an executive order that, beginning with the 1st of May, 20 per cent. of all duties is to be paid for in certificates to be bought of the bank.

SENATOR SHERMAN AND THE FOUR PER CENT. BONDS.

In his recent speech in the Senate replying to Senator Beck's attack upon his positions on the silver question—a reply which we consider perfectly successful at all points—Senator Sherman made a digression in order to show that he was not responsible for the outstanding 4 per cent. thirty-year bonds. His argument was, that the Refunding Bill (the Act of July 14, 1870), as reported by him in the Senate and as passed by that body, provided for the issue of $400,000,000 of 5 per cent. bonds to run ten years, the same amount of 4½s to run fifteen years, and the same amount of 4s to run twenty years; but that the House substituted for this a bill of their own, reported by the Committee of Ways and Means, providing for $200,000,000 5s to run ten years, $300,000,000 4½s to run fifteen years, and $1,000,000,000 4s to run thirty years, and that the Senate was obliged to accept this amendment or lose the bill altogether.

A careful examination of the proceedings and speeches in Congress while the bill was pending will show that there was no real controversy between the two houses respecting the time that the bonds were to run, although what Mr. Sherman says about the measure as it originally passed the Senate, and as it was amended by the House, is true. The point in controversy was as to the rate of interest, the House insisting upon 4 per cent. as the rate of the greater part of the issue, while the Senate favored higher rates. Senator Sherman, in presenting the report of the Conference Committee to the Senate (*Cong. Globe*, 2 sess. 41st Cong., p. 5531) did not lay any stress upon the duration of the bonds as a point of disagreement between the two houses, nor did Chairman Schenck when he presented the report to the House.

What is more to the purpose is the fact that when Mr. Sherman became Secretary of the Treasury in the year 1877, he found a contract in force entered into by his predecessor, Secretary Morrill, with August Belmont & Co. and their associates, known as the "bond syndicate," for the sale to said syndicate of $300,000,000 of 4½ per cent. bonds having fifteen years to run and maturing in 1891. The contract contained a clause authorizing the Secretary of the Treasury to terminate it at any time after March 4, 1877, by giving ten days' notice to the syndicate.

It is sufficiently indicative of the ideas held by Mr. Sherman, both while the bill was pending in Congress and afterwards, that the first step taken by him as Secretary was to stop the issue of 4½ per cent. fifteen-year bonds, and to substitute 4 per cent. thirty-year bonds in their place. All the facts are set forth in the document entitled "Specie Resumption and Refunding of National Debt" (House Ex. Doc. No. 9, 46th Cong., 2d sess.). Mr. Sherman first communicated his views on this point in a letter dated April 6, 1877, addressed to N. M. Rothschild & Sons, London, stating in a general way that he desired to sell only 4 per cent. bonds for resumption purposes (p. 15).

April 27, Mr. Sherman wrote to L. P. Morton, New York, a member of the syndicate: "After all, the 4 per cent. loan is the loan which we ought to seek to place upon the market, and which I hope the syndicate will be able to do by the 1st of July" (p. 27).

May 14, Mr. Sherman wrote to August Belmont, New York, proposing the withdrawal of $100,000,000 of the 4½ per cents and the substitution of 4 per cents in place thereof (p. 39). This does not appear to have been a formal notification of withdrawal as provided for in the contract. Hence some confusion, which arose later on.

May 17, Mr. Sherman wrote to L. Von Hoffman & Co., New York: "My purpose is to place upon the market as soon as practicable the 4 per cent. thirty-year bonds authorized by the Refunding Act, *which I regard as the most desirable security ever offered, both for investors and the Government*" (p. 41).

May 23, Mr. Sherman wrote to August Belmont & Co., New York, that it was his understanding that $100,000,000 of the 4½ per cent. bonds which the syndicate were entitled to take under the Morrill contract had been withdrawn, and asking whether Belmont & Co. so understood it (p. 44). Belmont & Co. replied under date May 26 that they presumed that the proposition would be agreeable to their London associates, but that the Secretary would see the propriety of awaiting their answer, which had already been requested (p. 46).

June 20, Morton, Bliss & Co., New York, as members of the syndicate, wrote to Mr. Sherman asking when and in what manner the notice of termination of the Morrill contract, including the right to take the remaining $100,000,000 4½ per cents, had been given. Mr. Sherman replied, June 21, that he had stated to the syndicate orally, at an interview held on May 11, his intention to withdraw the $100,000,000, and that if any serious opposition had been expressed, he should then and there have given the ten days' notice required, but as the suggestion seemed to be acquiesced in he did not do so. Finding subsequently that there was nothing in writing on the subject, he had written his letter of May 23 to August Belmont & Co. to remove any grounds for future misunderstanding (pp. 85-86).

The point of all this is, that Mr. Sherman stopped the sale of $100,000,000 of 4½ per cents having fifteen years to run, which had been contracted for before he came into office, and substituted a like amount of 4 per cents having thirty years to run. That his motives were patriotic and right in every way is fully conceded, but the argument made at this time to show that he exercised superior discernment in 1870, when the Refunding Bill was passing through Congress, and that his own wise purposes were overruled by the House Committee of Ways and Means, while technically true, is really an afterthought. Both Mr. Sherman and Mr. Schenck desired to save ½ per cent. per annum interest on the bonds, and both underestimated the element of time which, as matters have turned out, made the 4½ per cents the more desirable of the two classes of bonds for the Government. The total amount of interest to be paid on a 4½ per cent. 15-year bond is 67½ per cent., on a 4 per cent. 30-year bond 120 per cent. The syndicate people and the investing public made the same error of judgment. They were all as greedy for the 4½ per cents as the Secretary was reluctant to issue them.

THE BRITISH-AMERICANS.

In the meagre report which is all that we have seen of Mr. Goldwin Smith's address to the Canadian Club on Wednesday week, he appears to have given the British-Americans resident in this country some very good advice in the matter of getting themselves naturalized and taking an active part in American politics. If the stories be true which the British-American Association told him about the numbers which such naturalization would add to the electorate—90,000 votes in this State, and 40,000 in Massachusetts—its importance, both to Americans proper and British-Americans, can hardly be overrated. The latter would, if they acted together, control every election both in New York and in Massachusetts. If, for instance, they voted with the Republicans, they would overcome the majority with which our Democrats always "leave the city," and destroy that constant Democratic leaning which makes New York an uncertain State.

That British-Americans—that is, the Englishmen, Scotchmen, and Canadians resident here—would, as far as temperament and character go, be very valuable additions to the voting body in the United States, there is no question. They are for the most part sober-minded, industrious, and law-abiding men, who mind their own business carefully and let that of other people alone. They have, too, in a very high degree, as Mr. Goldwin Smith pointed out in his lecture, the political sense which has made England the political model for so many successful and unsuccessful "nationalities." That they have a fair readiness for political jobbery, the history of British politics reveals clearly enough, but it has always been held in check by their eminent capacity for, and eminent success in, lawful and honorable modes of making money. Consequently, an Englishman or Scotchman will hardly ever take to "politics" as a livelihood as a matter of choice, or until he has tried and failed in everything else. He is by nature, too, a very indifferent intriguer or "manager." He loves open-handed methods, and, in spite of considerable natural pigheadedness, is probably more amenable to argument than any other politician in our day. Votes are still sometimes changed in the British House of Commons by speeches, and we do not know of any other legislative body of which that can be said.

But there is apparently some danger that if the British-Americans follow Mr. Goldwin Smith's advice, and "take out their papers," they will do it under a misleading and somewhat mischievous influence. We do not know, of course, whether he inserted in his address to them the whack at Gladstone and the Irish with which he enlivens nearly all his utterances, and which we verily believe finds a place of honor in his morning and evening prayers. But

that hostility to Gladstone and the Irish colored his advice in some way or other we have little doubt; and that it is having an unfortunate effect on the minds of those British-Americans who are promoting this naturalization movement, we think is equally true.

We have reached this conclusion in part from a perusal of a few numbers of the *British-American*, a weekly journal started and published in Boston as the organ of the movement. We find it almost wholly given up to abuse of the Irish and the English home-rulers. Hardly a rational word does it contain about the politics of the country with which the British-Americans are invited to throw in their lot. Indeed, no one would suppose from reading it that there was any good reason why Englishmen living in America should become American citizens, except a desire to "get even" with the Irish, and punish American politicians for paying any attention to them. Now, we feel sure this characteristic of the movement will, if not got rid of, make most native Americans feel that the British-American voter would be anything but a useful element in American politics. The hostility between the two Irish factions, the Orangemen and the Catholics, has already disgusted them a good deal, and has inflicted on this city one bloody riot. The addition of another faction—an English anti-Irish faction, charged with the special function of following up the Irish and making things hot for them on the stump and at the polls—would certainly not be a cheering phenomenon for the thoughtful American patriot. What he seeks of all things is the deliverance of the American soil from adjourned European rows and scrimmages. What makes him most dislike the Irish is their importation into American politics of Anglo-Irish issues, with their accompanying hates, and jeers, and denunciations, and curses. He will therefore not welcome a British-American contingent which proposes to itself as its chief political duty, the justification to the American of the Cromwellian policy in Ireland in the seventeenth century. The American public is very weary of the Irish question, and, if it cannot have rest about it, at least craves that the shindy may not be aggravated by the appearance on the scene of 130,000 fresh combatants.

We think the very best advice that Mr. Goldwin Smith could give the British-Americans—and it may be that he has given it to them already—would be to prepare for American citizenship by cultivating their interest in the really important questions of American politics, such as the tariff and taxation, the civil service, municipal government, and electoral reform, and popular education and temperance, and let the Irish and Gladstone alone. In such questions we fear they now have very little interest, and know very little of them. The best thing they can do with their Boston organ is, to make it discuss them intelligently, both for their own enlightenment and to give Americans a taste of their quality. If they show the American public that on these questions they will powerfully reinforce the friends of economy, order, and progress, they will as citizens be very welcome indeed. As English "Unionists" or "Imperialists" they will not be worth to the United States the cost of naturalization, small as that is.

THE STATE BOARD OF ARBITRATION.

The Legislature in 1886 passed a law providing rules for the arbitration of disputes between employers and employees, on the familiar principle of the voluntary submission of the matter in controversy to arbitrators chosen by the parties. The same law provided for the appointment of a State Board of Arbitration, to whom appeals might be taken from the decisions of the local boards, such State Board to consist of three persons at a salary of $3,000 per year each, with a secretary at a salary of $2,000. A year passed by without any result except the payment of the salaries of the Commissioners and their secretary. The Board began to wear the look of superfluity, and even of drollery, for want of occupation. So the Legislature the following year added to their duties by passing a new law, providing that "whenever a lockout or strike shall occur, or is seriously threatened in any part of the State, and shall come to the knowledge of the Board, it shall be its duty, and it is hereby directed, to proceed as soon as practicable to the locality of such strike or lockout, and put themselves in communication with the parties to the controversy, and endeavor by mediation to effect an amicable settlement of such controversy." If their services are not wanted, however, they are authorized in their discretion to "inquire into the cause or causes of the controversy." It is not stated what they are to do after they have made their inquiry, but the presumption is that they are to say something about it in their next annual report. The last report of the State Comptroller shows that the cost of the Board of Arbitration for one year was $14,552.83. The gains appear to have been nothing, either in dollars and cents or in any other sense.

It appears to be the practice of the Board to search the horizon for strikes and lockouts very much as astronomers search the heavens for new comets. When they "pick up" one, they jump on the cars, and put themselves as speedily as possible in the vicinage of the controversy, and hang out a sign, "Arbitrating done here." If nobody brings in a job, they set to work to investigate the matter in controversy, and then disappear from sight until they pick up a new one. The presumption is that this series of manœuvres is helpful to Labor, but evidently it cannot be so unless Labor is helped by the payment of $14,000 per annum out of the State Treasury. One of the members of the Board of Arbitration must be a Democrat, and one a Republican, and the third must be selected "from a bona-fide labor organization of this State." If Labor derives any benefit from the Board, it must be from the payment of the salary of the third member. This is hardly sufficient compensation for the share paid by Labor, in its character as occupants of houses subject to taxation, for the expenses of the Board.

The antics of the Board, of which we are having a fresh example at this time in connection with the boycott and lockout in the brewing trade, are in pursuance of law, and very strictly so. If they are ridiculous, they are so because the law under which they were appointed is ridiculous. There does not appear to be any occasion whatever for any such board. The principles of arbitration are well settled in the nature of things. Arbitration, as the term applies, is the voluntary submission of a controverted matter to the decision of an impartial umpire. That the umpire may be impartial, and that his decision may have binding force, it is necessary that he be chosen by the parties. The State cannot compel brewers, for example, to hire men whom they do not want, or to hire anybody on terms that are not satisfactory, nor can it compel men to work on terms not satisfactory to themselves. The State may properly provide the rules under which arbitration shall be conducted, and may also rightfully enforce the decision so reached, as in any other case of contract. This was the scope and intent of the law of 1886. The addition of a State board having appellate jurisdiction was a superfluity, and even worse, because it entailed delay. After a dispute has been submitted to arbitration upon fair agreement as to the subject-matter and the persons who shall decide, an appeal to somebody else is manifestly superfluous, a mere dilatory proceeding, and must tend to lessen the number of cases submitted to arbitration. Probably this feature of the law accounts in part for the fact that it has been a dead letter. When the further provision was added that the State Board should make excursions here and there like travelling tinkers looking for jobs, and offering their services to parties who do not want them, and then prying into people's private affairs, the law became a mere conduit for the distribution of a certain sum of public money to politicians.

THE CONSTITUTIONAL POSITION OF PRUSSIA IN THE GERMAN EMPIRE.

The many serious questions of home and foreign policy which were raised in Germany immediately preceding and following the death of the late Emperor have again turned general attention to that unique creation of Bismarck's—the New German Empire. It is safe to say that no one can understand German politics or comprehend Bismarck's system of government who does not study them in close connection with this remarkable confederation.

German publicists and jurists have spent much time and ink in discussing the question whether the new Government is a *Bundesstaat* or a *Staatenbund*, *i. e.*, a Federal State or a Federation or League of States. Much bad blood has been stirred up, and more than the usual number of exclamation marks placed after quotations from writers of opposite views—with the satisfactory result, however, that there is now a pretty general agreement that it is a *Bundesstaat*. That there was this difference of opinion is not strange. Our own Federal Government was at first generally accepted as the type of a *Bundesstaat*, and it is no wonder that, with it before them as a model Federal State, many were inclined to put the German Empire in a different category; for many as are the similarities between the two

systems, the differences are almost, if not quite, as many, and are certainly more striking.

The difference of origin was noteworthy and significant for the character of the new States. Our own Government arose from the initiative of a body of delegates who took it upon themselves to act for the country as a whole, and, as a matter of fact, assumed the functions of a national Government, and did not, either in the form of treaties or of a constitution, have any legal authority for their acts until long after they had committed the country to a step from which there could be no retreat. When, later, a constitution was formed, its preamble began with "We, the people of the United States, . . . do ordain and establish."

The German Government sprang from a formal treaty between (nominally at least) free and independent States. According to this treaty a convention was to be called, consisting of representatives of the people, to which a constitution before agreed upon by the diplomatic representatives of the State governments should be submitted. If this should be accepted, it was to become the constitution of the confederation. As a fact it was accepted after numerous modifications to which the governments agreed, and it thus became law. But in its preamble it was expressly stated that the rulers of the different States (kings, dukes, senates of the free cities, etc.), concluded an eternal alliance, and the title of the President of this confederation was changed to German Emperor in the Constitution of 1871. Both Constitutions, then, that of 1871 as well as that of 1867, were based upon formal treaties. Thus Germany is a league or confederation in a different sense from that in which our own Federal Union may be said to be one.

But in the Constitution itself there is a recognition of a very different relation from that which exists in our own system. The upper house, corresponding in some respects to our Senate—the Bundesrath or Federal Council—is composed of diplomatic representatives of the various State governments. The members are appointed by the governments, are subject to their instructions, may at any time be recalled, and are accorded in Berlin by the King of Prussia the usual diplomatic protection and privilege granted to foreign ministers. Speaking generally, with some important exceptions, noted later, this Council is the executive authority of the German Empire. It is intrusted with the oversight of the administration of all laws. In this work the Emperor and the Chancellor, with his departments, are its agents. While it cannot pass any law without the consent of the Diet (Reichstag), it may make all regulations necessary for carrying out the laws, and is in general regarded by German jurists as the seat of sovereignty of the Imperial Government.

In this confederation, moreover, many of the States possess peculiar privileges which practically give them a veto power on legislation in certain cases—a circumstance which heightens very much the general impression of its being a League of States instead of a Federal State. The financial system, is in its chief outline, rather that of a society or group of States in which the expenses are paid as far as possible from the income of common property, and the deficit then made up by assessments. The administration of the imperial laws is largely in the hands of the separate States. Some of the States are allowed to have diplomatic representatives at foreign courts and to make treaties with foreign States on certain topics. Some are not subject to the Federal excise on beer and brandy, and have their own postal and telegraph system. All may make agreements with other States of the empire, and may levy customs duties, equivalent to their own excise taxes, on goods imported from other States where the excise does not exist. There are numerous other provisions of the same sort, making altogether quite a different form of federal government from our own.

In general it may be said that in the German system the State Government, as such, plays a much more important rôle in its relations to the Federal Government than in our system. In many more cases the central authority works through the States and addresses itself to their governments. If Alexander Hamilton was correct, then, in his implied definition of a federal government as one which acts immediately on the individual citizens, and not mediately through the State governments, and thus distinguishes it from a league or confederacy, which acts only on the States as its subjects, then the new German empire is a *Staatenbund*, and not a *Bundesstaat*. On the other hand, if the definition of a Federal State which Woolsey hints at in his 'Political Science,' and which German jurists have fully developed, be correct—viz., a union of States with a will of its own distinct from the mere sum of the wills of its constituent States, and with the power to enforce this will against a recalcitrant member, whether it acts on States or individuals—then the German Empire should be included in this category.

Now, how has it come that a government for which Alexander Hamilton—no mean judge—would, on general principles, have predicted a complete failure, has proved itself on the whole such a success? It will be remembered that Hamilton in the *Federalist* tried to make out that no federal government could hope to succeed which attempted to lay its commands on States as such and to enforce them against the will of the latter.

The answer to the question is to be found in the overwhelming power of Prussia in the present German Empire—a power which is not only practically recognized, but constitutionally guaranteed in the most solemn manner. A recent German writer on constitutional law has emphasized this fact very happily—though it must be said much to the disgust of some of his contemporaries—as follows: "The German Empire (or Constitution) is the legal form according to which Prussia rules in non-Prussian territory. The share of the other States is really merely a limitation of Prussian initiative" (Otto Mejer, 'Deutsches Staatsrecht,' 1885).

How true this is will be understood after a glance at the constitutional position of Prussia in the empire. In the first place, the Prussian King is *ipso facto* or *ex-officio* German Emperor. It is true that this circumstance is perhaps not so important as it may seem at first glance, since the Emperor, as such, has only a very limited veto power, unless Laband's interpretation of the Constitution noted below is correct, according to which it is his duty to pass on the constitutionality of a law. Even then, if in his judgment the law is constitutional, he must promulgate it, however much he may be opposed to it. He may, however, veto absolutely as Emperor any law altering existing laws relating to the army and navy, and although he cannot prevent legislation on other subjects, still, as the chief executive of the empire, he practically possesses great power.

There were in 1871 twenty-five States in the German Empire represented in the Federal Council. In order to recognize, to some extent at least, difference in importance among the States, some of them have more votes than others. Each State has at least one vote, but Saxony and Würtemberg, for example, have 4 each, Bavaria 6, and Prussia 17, the total number being 58. All questions are decided by majority vote (with exceptions noted later), and each State must cast its votes as a unit. This follows naturally from the diplomatic character of the representation.

Prussia has the Presidency of the Council. It has also the chairmanship of all the important committees, and the functions of these committees are more important by far than those of similar committees in our Senate. Prussia has a solid seventeen votes on every question—thirty constituting a majority—and it must be a rare occasion when it should not be able to get thirteen more from some quarter or other. But with these seventeen it can prevent all amendments to the Constitution, since they are rejected if there are fourteen votes against them in the Federal Council. Moreover, in certain important matters of legislation Prussia has a veto, and in all cases of a tie vote that side wins on which the votes of Prussia are to be found.

As if all this were not enough, Prof. Laband has put an interpretation on the Constitution which places in the hands of Prussia still another advantage. By the Constitution it is made the duty of the Emperor to prepare and publish the laws which have been passed by the Council and Diet. But, says Laband, if he thinks the law is unconstitutional, he should not publish it, and without publication by the Emperor it is not binding. This gives Prussia—for we must not forget that the Emperor of Germany is first of all King of Prussia—a practical veto on all laws which could in any way threaten its supremacy in the empire. Whoever rules Prussia and Prussia's King, therefore, will rule Germany, and there is no more danger of a dissolution of the German Empire, except by the interference of a foreign Power, than there is of the dissolution of the State of New York.

EAST END MISSIONS.

LONDON, March, 1888.

MR. BESANT is less a prophet abroad than in his own country. Here, it is true, his claim to the original idea of a palace for the people has been disputed. But the Philadelphia *Press* (Feb. 26, 1888) would take from him even the credit of having written his most famous and successful story:

"The many people," it says, "who have read James Payn's novel, 'All Sorts and Conditions of Men,' remember the People's Palace which the heroine reared for the poor of London. The novel made such an impression in London that the novelist's palace in the air became a reality in Toynbee Hall, which was opened in the jubilee year for the poor of the Five Points in East London."

It would be scarcely possible for so short a paragraph to contain a greater number of mistakes. If Americans are interested in the work of philanthropists in the East End of London, it would be as well if it were reported to them accurately.

Public attention is just now attracted to this work. It is all but a year since the People's Palace was opened, so that there has been time to test its value and influence. At this season the annual exhibition of pictures is held at St. Jude's Schoolhouse, which is under the direction of Mr. Barnett, the Warden of Toynbee Hall. These two institutions are looked upon as the principal factors for good in East London. Though they differ in many ways, both have for aim to elevate and refine the workingman. The People's Palace nominally proposes to do this by amusing him; Toynbee Hall also provides for his amusement, but relies above

all upon the good effect of his association with the educated and rich who make it their home. The latter is, in fact, a nineteenth-century monastery. It was established, it will be remembered, as a memorial to Arnold Toynbee, one of the first workers, according to modern methods, in the East End. To it came Oxford and Cambridge men, not on any special mission, "but simply to share the life of the surrounding population, to become good citizens of East London, giving freely and naturally to those around them of whatever is best in them, whether in mind or character, and learning in their turn, as they undoubtedly will learn, to help their new neighbors and the new conditions of life in which they find themselves."

Much has been said of their self-sacrifice. People speak of Toynbee Hall, lost in the wilds of Whitechapel, as if it were a Grande Chartreuse or a Monte Oliveto. The fact is, that it is in a far more convenient and central neighborhood than many fashionable West End suburbs. It is in East London, it is true, but on the very borderland of the city. Within a five minutes' walk are two underground railway stations from which Charing Cross can be reached in fifteen minutes. On Whitechapel Road are to be had omnibuses to almost all parts of West London. To the visitor to Toynbee Hall it is evident that its residents do not by any means live the life of the people among whom their days are spent. The house is comfortable, if not luxurious. However, as has been explained, "the idea is that the poor should see something of the life of the cultured and wealthy classes, of the rest and refinement and art and ornamentation of good homes." Whether this insight into pleasures beyond his reach will do the workingman any positive good is more than doubtful. After drinking tea in the pretty drawing-room of Toynbee Hall, he will hardly be more reconciled to his own conditions of life. That he may be benefited negatively, and in a manner somewhat different from that intended, is probable. Discontent in his case would be an advantage. All who have really worked among the people of the East End agree that their own apathy is their greatest enemy. They are too contented, a clergyman, who spent six years of his life as rector of a church in Stepney, has explained. A Socialist, who often holds open-air meetings in the East End, has told me that the indifference of the people—more pronounced in the younger generation—is the stumbling-block to all who would better their condition.

It is difficult to believe that the Toynbee Hall men, whose position and habits and occupations are so radically different from those of the workingmen, will ever be received by them on terms of friendly intimacy. Common work or common idleness is the bond that holds men together in all walks of life. But that this would-be friendship is theoretical; that caste distinctions are not shaken off when the threshold of Toynbee Hall is crossed, is but too plainly shown on occasions such as that of the formal opening of the picture exhibition in St. Jude's Schoolhouse. The show is supposed to be primarily for the people of Whitechapel, or rather of the East End. They had not even a single representative at this year's opening ceremonies. These, indeed, were held at an early hour in the afternoon, which made it quite impossible for workingmen or women to be present. The lower room of the schoolhouse was filled, but with the people who flock to West End private views. Through the large windows, beyond the platform, I could see workingwomen, busy about their daily duties, and ragged children coming and going on the balconies and stairways of the opposite row of tenement-houses. The contrast I thought significant. Mr. Holman Hunt, who opened the exhibition, delivered an address which would have been unintelligible to a genuine Whitechapel audience. It was principally taken up in showing that all modern art—except, presumably, his own—is bad, and that of all this bad art, that of the Continental schools is the worst. It was funny afterwards to find in places of honor in the rooms up stairs pictures by Carolus Duran, Munkácsy, Favretto, Tito, Van Hannen, which brought out in painful relief the crude color and labored technique of two of Mr. Hunt's pictures, lent by him to the exhibition. In concluding his address, he complimented Mr. Barnett and the Toynbee Hall men on the good work they were doing in bringing art to the people, from whom, in its greatest days, it has always sprung. Whether, however, they are going about it in the right way was made questionable by the speech that followed. It is better, we were assured, to show the people pictures which can contribute to their instruction, no matter how badly painted they may be, than pictures technically good but without a subject. In other words, the art education of the people upon whom all hopes for art rest, is begun on a false basis. Assuredly the result of such training will be to make their second state worse than their first. They are having prepared for them the difficult task, not only of learning, but of unlearning.

But in East London even amusement must serve a moral or intellectual purpose. People are to look at pictures, not merely for pleasure in them or to be taught something about art, but to be intellectually or morally regenerated. The catalogue of the St. Jude exhibition is a model of ingenuity in discovering rare thoughts, intentions, and aspirations in the simplest picture. The same desire to consider everything from a moral and sentimental standpoint was manifested that same afternoon in the treatment of decorative art. We were taken into the dining-room of Toynbee Hall and shown its decorations. They have been executed by workingmen and boys under the guidance of Mr. Ashbee. The latter is an architect, and was a pupil of Messrs. Bodley and Garner, who have just erected the abomination, called a reredos, with which Dean Church, to his lasting discredit, has allowed them to ruin the interior of St. Paul's Cathedral. What I saw of the work, done under Mr. Ashbee's guidance, proved that, unfortunately for the British workman, he is a worthy pupil of his masters—architects who will be remembered by after generations because of their vandalism. The walls were painted in dark red, apparently in imitation of a Morris wall paper. The frieze consisted of a row of gaudily painted shields set on a staring white ground. Mr. Ashbee said nothing of the merit of the work or the methods of his system of teaching. He dwelt instead on the fact that it was all "love-work," the men and boys having devoted to it their leisure hours and presented it as a gift to Toynbee Hall. The only other point upon which he insisted was that the painting on the walls was freehand—hardly a virtue when the work could have been better done and time economized by stencilling, as even Mr. Morris would admit.

However, the good accomplished by the picture exhibition as a means of recreation cannot be overestimated. It is kept open on days and at hours when workingmen are at leisure—exactly the days and hours when the British Museum and National Gallery, Bethnal Green, and South Kensington Museums are closed. Admission is free. No one is hurried or interfered with. The season for it is well chosen. Later the people enjoy their Sunday holiday out of doors in the open green spaces of which there are so many in London. But just at present, though the days grow longer, they are no less gray and gloomy and wet.

The directors of the People's Palace have had the same good sense. The Queen's Hall, the only part of the building finished as yet, is also opened on Sunday, though even in the East End there is much opposition to this sensible measure. The Palace but partially realizes Mr. Besant's ideal. In his story the Palace of Delight was given to the people; they were to be its managers and guardians; they were to do with it as they chose, to originate its amusements and organize its classes—if classes were wanted. The real Palace, while it has no monastery attached to it, is in the hands of trustees who do not consult the workingman even when his interests are most vitally concerned. A veto has been passed against beer, but his opinion on the subject has not been asked. The workingman, in Mr. Besant's book, could drink his glass comfortably as he smoked his evening pipe. Still, much calling for praise has been accomplished since (less than a year ago) Whitechapel hung out the flags of the Metropolitan Board of Works and welcomed the Queen to the hall named in her honor.

The Palace is much further east than Toynbee Hall. The road to it from the city is wide and airy, lined with shops, with here and there a quaint old almshouse or substantial eighteenth-century residence. You see little or nothing to suggest the utter misery now associated with the name of East London. Indeed, not anywhere in the East End have I seen squalor and degradation greater than that of Drury Lane or Westminster slums. It is depressing because of its vast extent. Nowhere else are you so conscious of the large majority of those who live to toil and toil to live. At the Palace gates, as at Toynbee Hall, there is nothing to pay. This being the case, it is to be regretted that the walls are placarded with notices of classes and lectures and concerts for which a fee is asked. The fee is usually small, but its conspicuous advertisement doubtless frightens away many a workingman. The Hall within is large, light, and pleasant, but decorated most vilely. I believe classes for the minor arts have already been started in connection with it. Instructors should at once impress upon students the vileness of these decorations. To give the people bad models, to surround them with what is artistically worse than worthless, is a poor way to cultivate their feeling for art and beauty. Recreation at the Palace has not yet assumed the importance Mr. Besant meant to give it. Those who wish to be instructed have a better chance than those who wish to be amused. The principal means of recreation are the library and music; and fortunately both are available on Sundays. An organ recital is given at 12:30, an hour when morning service is over and public houses are about to open. Every time I have been to the Palace at noon on Sunday, I have found the Hall well filled, the people listening to the music quietly and with apparent enjoyment, the greater number staying until the very end of the performance. Almost as many return in the afternoon to read. Near the door are newspaper stands with almost all the London and many of the provincial daily papers. At the tables, in the body of the Hall, are to be had the illustrated and comic weeklies and the monthly magazines. On either side, against the wall, are bookcases which already contain many standard works. Even Crowe and Cavalcaselle have penetrated to the East End. In more than one American city the opening

of a reading-room on Sunday would be accepted as a matter of course. But in London, where it is something new, the step taken by the directors of the People's Palace must be welcomed as one in the right direction.

One has only to see on Sunday this great Hall and St. Jude's Schoolhouse during the exhibition, to know that they are appreciated; but whether by the class for which they are intended is another question. As a rule, the genuine workman is conspicuous by his absence. The crowd at each place is made up of people fairly well dressed—apparently small shopkeepers and clerks and the higher class of artisans. The man in corduroys with the handkerchief around his neck, and the woman of that peculiar type unknown out of London, are slow to come and quick to go. One Sunday afternoon, at the picture show, a clergyman of the East End assured me that everybody in the room with us belonged to the working class which I thought unrepresented. Clothes are cheap in the East End, he said, and they all buy black coats for Sunday. But the fact remained that the near streets were filled with workingmen in working clothes. In groups around the costermonger's cart, or lingering at the door of the public house, were the corduroys for which I was looking. Music and pictures and books add much to the lives, only too dull and colorless, of those who are taking advantage of them. But so far they have not appealed to the typical British workman, who is being besieged by politicians, social reformers, and philanthropists, and continues calmly indifferent to them all. N. N.

Correspondence.

MR. FOULKE'S INQUIRY.

TO THE EDITOR OF THE NATION:

SIR: Between the 1st and 20th of August, 1885, noticing that "suspensions" of postmasters before the expiration of their terms were becoming very frequent, I addressed 193 letters, indiscriminately, to postmasters suspended in this State, and 102 letters to Presidential postmasters elsewhere. I inquired of each the cause of the suspension, whether any charges had been made, whether there was any investigation or any opportunity for an investigation or defence. To these letters I received 158 replies; some of these showed that the officer had resigned or that his term had expired, a few failed to answer the questions, but 136 gave me the desired information—101 from Indiana and 35 from elsewhere. *In only two instances, one in Indiana and one in New York,* had there been any investigation; *in every other case* no notice of any charges had been given, no cause assigned, no opportunity afforded for defence, denial, or explanation; in a large number of cases the first information on the subject received by the postmaster suspended was by newspaper report or upon presentation of the order of suspension by the new appointee. In fifteen cases in Indiana the change was attributed to the Congressman in the district, the successor having been promised the office in some instances. Sometimes the parties learned by hearsay and street rumor that charges of offensive partisanship had been preferred. In ten cases in Indiana (and eleven cases elsewhere), a request was made for information respecting the charges and an opportunity for investigation, but no such opportunity was given, nor were the charges disclosed.

Knowing that this information was ex parte, and not believing it possible that these removals were thus made with the approval of the author of the letter to Mr. Curtis, I communicated to the President personally the results of my inquiries, together with the names of the postmasters in question. I found, however, that the President approved this course. He stated that he considered it impracticable to inform the postmasters of charges against them, that this would be to turn the question of their removal into a judicial investigation, that they were continually protesting, objecting, and asking for copies of the charges, but that these could not be furnished them. I suggested that there was little use of requiring that charges should be preferred, if the postmaster was not permitted to see them and there was to be no investigation; that charges were frequently made by persons utterly irresponsible, and often by those who did not pretend to know the facts; that such charges were frequently false, and that it was not possible to procure accurate information until both sides had at least a chance to be heard. He said he regretted that I had made these inquiries, that the Department had to get its information as best it could, that he had great difficulty in bringing many of his party friends up to his ideas of this reform, and that Indiana was a particularly bad State in that respect. I left in his hands a summary of the results of my inquiries.

Frequently the accuser was rewarded for his secret charge by appointment to the office. I could name many instances:

LOUISA C. CANINE states that she was removed without notice upon the false charge, preferred by A. J. Kitt, her successor, that she was a non-resident.

A. H. SYMPSON.—The affidavits against A. H. Sympson of Winchester, Ky., were prepared by William M. Bickner, a relative of his successor. Among the parties swearing to them was Dory Hazzard, a worthless negro of no character.

W. L. SEATON of Jackson, Mich., was assured that his successor (an editor of a Democratic paper) filed charges of offensive partisanship against him.

CHARLES G. MICHAELS of Hope, Ind., writes that the charges were preferred by E. A. Monnanth, a brother-in-law of his successor, L. O. Miller.

E. R. KIRK of Sioux City, Ia., was removed through the agency of one Chase, an office-broker, upon affidavits of partisanship made by an ex-policeman and the son-in-law of his successor, Crawford.

S. A. MARINE of Vinton, Ia., heard that the specification against him was the delivery of a partisan address on Decoration Day, which was, in fact, delivered by his brother.

In many instances, such as Philip Kendall, Portland Mills, the charge, alleged to be false, is attributed to a personal enemy, for the purpose of working out an old grudge

MRS. ISABELLA DE LA HUNT of Cannelton was removed without notice, upon the charge of thrusting offensive campaign matter into the boxes of patrons, which, as it appears by her affidavit, was false.

R. M. BARTLEY of Owen, Ind., heard that the charge against him was that he had received corruption funds, bought votes, and spent days electioneering, all of which he pronounces utterly false.

J. H. STEWART.—The charge against J. H. Stewart of Chariton, Iowa, as he understood it, was exhibiting an obnoxious campaign banner in the Post-office building. He shows, by affidavits, that it was not exhibited by him, nor in any room under his control, and that he requested its removal. His successor was Chairman of the Democratic Central Committee.

IDA CARPENTER of Butler, Ind., writes that she understands the principal charge was that she sent money to the Republican State Central Committee, which was false.

No doubt some of these denials by the suspended postmasters may themselves be untrue. They are ex-parte statements, and necessarily so from the fact that neither the charge nor the accuser was in most instances definitely known. Among so many removals there were no doubt a good number which were properly made. My objection was not to any particular case, but to a system which made it impossible for the Department to know whether the charge was true—a system by which many acts of flagrant injustice must of necessity be committed. Such a system would naturally be used by spoilsmen to get places. Indeed, the appointees appear to be largely from that class.

W. M. HANCOCK, Postmaster at Meridian, Miss., states that he was succeeded by Col. J. J. Shannen, who was convicted January 2, 1872, in the United States District Court at Jackson, Miss., of criminally conspiring with others for the purpose of depriving persons of African descent of equal privileges under the Constitution of the United States.

M. M. HURLEY of New Albany, Ind., understands that he was suspended without written charges, but upon verbal charges made by Congressman Howard and O. O. Stealey of the Louisville *Courier-Journal.* His successor was Chairman of the Democratic County Committee, and one of the proprietors of the *Ledger*, a Democratic paper and a Southern sympathizer during the war.

CRAWFORD, successor of Kirk of Sioux City, Ia., had been sentenced to the penitentiary at Yankton, Dak.

The successor of A. S. Orr of Wilkesbarre, Pa., was Chairman of the Democratic State Committee, editor of a Democratic newspaper, and friend of Randall, by whom the appointment was made.

A. W. AMICK of Lexington, Ind., writes on August 3 that ever since his successor was appointed he (Amick) has had to make out the reports to the Department.

You are no doubt familiar with the case of James Dowling, appointed by the influence of Mr. Bynum, Democratic Congressman from Indianapolis, to a position in the railway mail service. Dowling boasted that he had bribed certain members of the Common Council of Indianapolis. For this he was tried by Council and found guilty by a two-thirds vote. A majority voted to expel him, but the requisite two-thirds was lacking for that purpose. Before the Grand Jury Dowling refused to testify, because his answer might criminate him. These facts are notorious to every man in this State. Mr. Vilas, Postmaster-General, was notified of them by Lucius B. Swift on September 12, but wrote to Mr. Swift that it would be fair for Mr. Dowling "to have notice of the accusation, because inquiry might put a different complexion on the case."

The importance of investigation, and of the old maxim "Audi alteram partem," was thus recognized by the very man who refused to grant it in many cases above. Mr. Dowling remained in the service until he finally suffered a mail train to go to Peoria and back without any attendant, and the mail remained undistributed. Then he was finally discharged. This happened not long ago.

I would call your attention to the fact that these are not cases of mere mistaken appointments which may be attributed to erroneous information; but they show the deliberate adoption of an utterly vicious principle. It is to say in effect that no one but the man who will consent to prefer charges against his neighbor, which he knows are neither to be seen nor answered, is to be rewarded by the coveted place. It is to hold out, by a uniform system, a direct premium to libel and false testimony, which are to be protected by perpetual secrecy. The files of the Department are the lion's mouth for the reception of charges against the guilty and innocent alike. To adopt such a course is to establish that law of most unnatural selection which leads inevitably to the survival of the most unfit.

It is the man who will descend to secret calumny who is rewarded by the spoils of office. The first that is known of the charge is from the reading of the sentence. And this is done under the direction of a President who has told us that "the voters of the land have learned that mystery and concealment in the management of their affairs cover tricks and betrayals." There can be little question of the aptness of his own words in the description of his subsequent conduct. Such methods are decidedly worse than the spoils system itself.

Yours, WM. D. FOULKE.

RICHMOND, IND., April 11.

THE PREOCCUPATION OF THE SOLID SOUTH.

TO THE EDITOR OF THE NATION:

SIR: People who expect the "Solid South" to break up on such questions as the tariff, internal revenue, or any other issue of practical politics, are ignorant of Southern history. When did the South divide on the negro question? Did not our wise (?) men demand protection to slavery, yea, rather, "extension" of slavery, at the sacrifice of all else? Did not they allow the free North to dig its canals, deepen its harbors, make magnificent its cities, perfect its school system, and enrich its farms while the South languished in the shackles of slavery? What cared our forefathers for a new State if it was not to be a slave State? What made a Breckinridge possible, and drove a Douglas from the ranks of Southern Democracy? The immortal Henry cried aloud for "liberty," but his own Southland ever demanded slavery or disunion, which meant death.

From my standpoint, I am amazed that a section of the Union should have clamored for the continued life of an institution whose death sentence had been agreed upon by the nations of earth. Bold? Yea, but infinitely bad judgment. The negro as a chattel was no more absorbing of Southern thought than is the negro as citizen. As in the past, so now, the negro is, and, it looks to me, ever will be, the one controlling and consuming issue with the South. Talk of every other economic, practical, desirable subject that should engage the thought of our people and the time and talent of our law-makers, and the Southern man may listen and may agree with you or dissent, but he is sure to conclude with a question after this order, "What about the nigger?" This is the ghost in the way, the horrid "nightmare," the ghostly skeleton. Ask him of what the "cavalier" is afraid, and he will answer, "Of Cuffee." Ask for a reason, and he can give none, but will repeat, "Cuffee." Remind him that the negro men of the South had charge of the farms of the South during the war, and that from them they furnished the food with which to feed the army fighting to forge but the stronger the chains of slavery, and he will, yea, must, admit it. Say to him that during all those dreary days of death and destruction the strong arm of the negro defended the peace and purity of his home, and he cannot deny it. Recall to him the fact that though our fathers asserted with confidence that the negro without a master would become such a monster that no society could tolerate his presence, when the history is that he is as docile as when he wore a chain, and a more useful inhabitant of the earth than when he was driven to his work, and this he will admit under protest. Tell him that our social circles in this year of our Lord 1888 are as safe from invasion as they were before the emancipation proclamation had been issued or written, and he feels the truth of what you say. Say to him that the negro does not "strike for higher wages" or fewer hours of work, that he is a stranger to the faith and follies of the anarchists, that he is content with an humble home and coarse fare, and to all this he must give an unwilling assent; and yet he will remain stolidly indifferent to every other public demand and patriotic obligation for fear of the "nigger."

Our ancestors wasted their strength and exhausted their energies fighting *for* the negro, their children are consuming theirs fighting *against* the negro. Madness before 1860, madness since, and all because of Cuffee and what so many are pleased to term *consistency*. Those who are not always dodging behind the negro as a pretext for not doing plain public duty, are harping on *consistency*. "My daddy lived and died a Democrat, and by the gods so will I"; "he carried the stone in the sack along with the grist to the mill, and so will I." Tell him that Gladstone was originally a Tory, but that his good sense made him a Radical, and that Radicalism made him great, and he will listen to you and then laugh at you. What hope for such a people? God in his wisdom alone knows.

What is the duty of the North, these things being so? Simply to take care of the Government, and continue to watch its growth, and see that it *does* grow. When the Chicago Convention meets, let the representatives be busy to know who can carry New York, the Pacific States, the *always free* portion of this grand Government of ours; and give leadership to that man. The South won't vote for him, and its silver tongue will grow eloquent in denouncing him; but make him leader, make him President, and let us hope that, after a time, prejudices will all be buried, passions banished from the consideration of grave public concern, and the Southland will have been breathing the air of freedom so long that it too will address itself to the work of material development, and not be frightened from its earnest purpose by any false alarm of small-fry politicians, whose little capital consists of energetic cries of "Run, white man, the nigger catch you."

EX-REBEL.

VIRGINIA, April 14, 1888.

PRO PATRIA.

TO THE EDITOR OF THE NATION:

SIR: In reading over the history of the past, one is led to believe that there have been times when good citizens supposed that it was both a duty and a privilege to lay down property, or even life, for their country, in times of public danger. We seem to have passed the stage in the development of the race to which such doctrine belongs; and the present theory of patriotism in case of war seems to measure the duty of personal sacrifice by the chances of restitution after the crisis shall have been passed. As an illustration of this interesting change, it is only necessary to cite the recent telegram of the Governor of Ohio announcing to the world that "We want the direct tax refunded *because the United States owes it to us.*"

If the South should break out into rebellion again, during the excitement of the coming Presidential campaign, and the Government at Washington should be obliged to call upon the States for a direct tax equal to the amount formerly levied, the Governor would doubtless send on a signed receipt for the principal of the old debt, and, in view of the circumstances, would probably delay his suit against the Union for unpaid interest until the war should be over and a surplus should again begin to accumulate in the vaults of the national treasury.

W. H. JOHNSON.

BUSINESS "FAILURES."

TO THE EDITOR OF THE NATION:

SIR: Your article on "Business Failures" in the *Nation*, April 12, 1888, is startling in its conclusions. On January 1, 1888, Messrs. R. G. Dun & Co. issued a circular giving the number of failures in the United States for the thirty-one years from 1857 to 1888, which shows by accurate statistics the failures in 1885 to be one in 86, in 1886 one in 98, in 1887 one in 111. Back of this, from 1884 to 1857, the full returns are not quoted, but they cannot have averaged much worse results than the three years from 1885 to 1887, and the three disastrous years 1857, 1861, 1873 will not go below one failure in 75.

Where is the fallacy—in the reading of the Dun & Co. figures, or in your reasoning?

Yours, JOHN A. WALKER.

JERSEY CITY, April 16, 1888.

[The apparent "fallacy" arises from the confounding by our correspondent of the restricted sense of the term failure as bankruptcy with its broader meaning as used by Mr. Walker and in these columns—"fail of success," as we put it. This means not necessarily, nor in the majority of cases, that a man who has started in business on his own account ends in the bankruptcy court, but only that, after making thorough trial, he discovers that he is not succeeding in that line, and gives up the experiment.—ED. NATION.]

MOST FOR *ALMOST.*

TO THE EDITOR OF THE NATION:

SIR: In commenting on this use, consulting brevity, I omitted mention of the Anglo-Saxon *mæst*, "fere," "plerusque." Of this, and also of *most*, bearing the same sense, in old English, down to the fifteenth century, I could have written in detail. My rough notes, I find, contain abundant particulars about them.

Your correspondent "C." says, in No. 1187, that "this use of the word is a tradition from very far back." To sustain this assertion of a "tradition," he should have produced something like a catena of authorities. As it is, his quotations, two in number, belong to a period when English, as the term is ordinarily understood, was still in the future.

I have said that *most*, "almost," "must have originated among the ignorant." According to "C.," "it did not originate among the ignorant." But this denial rests on the assumption that, to us of later times, it is a venerable "tradition." Research may show this, a thing not yet shown.

"No proof that it is other than a modernism is known to me." So, with misleading conciseness, I wrote in January. And it was, chiefly, because I was not then acquainted with the passage about to be given, that I was disposed, as, with respect to it as now current, I am still, to accede to Dr. Murray's view, that it is traceable, through *a'most* of the last century, to *almost* aphetized. The passage referred to, which I chanced on only a few days ago, is as follows:

"Wee are, *most* all, of Issachars Tribe; therefore, vsually choose callings of greatest ease." Dr. William Sclater (1626). *Expos. II. Thess.* (1629), p. 275.

This work I have cited for "*mostly* all" and "*mostly* always," with the suggestion that its author therein possibly adopted rustic expressions which he heard about him in Somersetshire. I now extend the suggestion to his "*most* all." Quotations for this, or the like,

from books dating between 1450 and 1600 would be interesting.

In some parts of the South, the negroes say *hit* for *it*. No one supposes that this was imported, in recent years, from England. Nor, again, does any one suppose it to have been derived, by continuity, from the days of Queen Elizabeth. Its occurrence cannot but be purely fortuitous.

Most all, with *most any*, etc., may, in like manner, have reappeared, in very late times, quite independently of more or less ancient precedent. Is its history this, that it was once catholic English, then became dialectal, if it did not die, and finally was redevised, to be taken up by the English-speaking vulgar in general? Perhaps we shall by and by know.

Owing to a slip of the pen, Chaucer is spoken of, in your 215th page, col. 1, as of the "fifteenth" century, instead of "fourteenth."

Your obedient servant, F. H.

MARLESFORD, ENGLAND, April 9, 1888.

Notes.

IN honor of the coming centennial year, Mr. Paul Leicester Ford will issue, in a limited edition, a reprint of rare controversial pamphlets for and against the ratification of the United States Constitution, accompanied by a bibliography of the books and pamphlets relating to the ratification and to the development of the national political parties of the time. This useful compilation will be entitled 'The Constitution of the United States, 1787-1789,' and will make an octavo volume of some 500 pages, procurable by subscribers for five dollars. Mr. Ford's address is 97 Clark St., Brooklyn, N. Y.

Another limited edition of which we are notified is that of the late Centennial Proceedings at Marietta, Ohio, April 7, 8, in the *Ohio Archæological and Historical Quarterly*, obtainable of Mr. A. A. Graham, Secretary, Columbus, Ohio.

Harper & Bros. publish directly 'France and the Confederate Navy,' by Mr. John Bigelow, and a revised edition of Green's 'Short History of the English People,' of which Mrs. Green has had charge.

Roberts Bros. send us 'The Ordeal of Richard Feverel,' in the popular edition of George Meredith's works—the author's edition at the same time.

The second volume of Prof. Henry Morley's 'English Writers' (Cassell & Co.) covers the period from Cædmon to the Conquest, and consists (as the first volume did) of a revision of his work upon early English literature published several years ago. Cædmon, Bede, Cynewulf, Alfred, and Ælfric, with selections from the anonymous writings, are specially treated. The citations made in illustration of this literature are somewhat capricious, and the treatment involves altogether a disproportionate amount of ecclesiastical history. The chapter upon the Sagas is cognate to the subject, but is hardly a part of it. The work as a whole is involved and cumbersome in construction, and the style is dull. Its use must be only that of a minor book of reference.

Volume viii of the publications of the Oxford Historical Society (Clarendon Press; New York: Macmillan) is 'Elizabethan Oxford; Reprints of Rare Tracts,' edited by Charles Plummer, M.A., of Corpus Christi College. This volume, containing 260 pages, is late in its appearance, for the reason that it takes the place, among the publications of 1886, of another work, which was necessarily delayed. It consists entirely of reprints, five in number, together with notes and appendices, and will be found very valuable in the study of the literature of this period. The works reprinted are: (1) Nicolai Fierberti Oxoniensis Academiæ Descriptio, 1602; (2) Leonard Hutten on the Antiquities of Oxford; (3) Queen Elizabeth at Oxford, 1566; (4) ditto, 1592; (5) Apollinis et Musarum Eidyllia, per Joannen Sanfordum, 1592. The three last of the number are devoted to the two visits of Queen Elizabeth, and contain a variety of addresses, entertainments, etc., in prose and poetry, Latin and English. Along with this volume we have received another of 170 pages, in the same general style, but not bearing the imprint of the Oxford Historical Society, entitled 'Rough List of Manuscript Materials relating to the History of Oxford, contained in the printed Catalogues of the Bodleian and College Libraries, arranged according to Subject, with an Index, by F. Madan, M.A.'

Mr. W. J. Rolfe has edited 'The Poetical Works of Sir Walter Scott' with a completeness and accuracy not elsewhere displayed; and a beautiful octavo volume, freely illustrated, has been issued with the above title by Ticknor & Co., Boston. The best of the songs that occur in the novels and plays are here given, along with all the original poetical mottoes placed by Scott at the heads of his chapters. There is a table of contents (which would have been improved by indicating the songs, like "Lochinvar," involved in the longer poems) and an index which, in one way or another, serves as a key to the general contents Finally, Scott's notes are massed together, with judicious abridgment. Mr. Rolfe has discovered and repaired many disfigurements of the longer poems in particular, caused by the poet's own unchallenged carelessness of revision, and by that of his editors and their copyists. He has also commendably undertaken to make the punctuation more modern and rational, having an eye to redundancy in particular. No task is more laborious and hardly any more useful than this, in the case of poetry. Even Mr. Rolfe nods at times in the application of his principle, as he will acknowledge. In the song "O, Brignall banks," on page 297, a superfluous comma at the end of the first line of the third stanza, a faulty comma at the end of the third line of the fourth stanza, are instances in point. But it is enough that this edition should outrank any other, even if not flawless.

The Report of the Commissioner of Education for 1885-86 has the merit of condensation, which has been deliberately sought, and other improvements are visible. The absence of any special discussion of the needs of education at the South would indicate that Commissioner Dawson's horizon does not coincide with Senator Blair's. The freshest document in the book, and one of the most interesting, is a report on the neglected schools in Alaska, dated May 2, 1887. The educational benefactions of the year amounted nearly to $6,000,000. Of this sum one-sixth is credited to New Jersey, and somewhat more than another sixth to Massachusetts and New York combined. Tried by this test, public spirit was more rife in Louisiana than in Maine, in Virginia than in Connecticut, in North Carolina than in Vermont, in Kentucky than in New Hampshire, in Texas ($1,000) than in Rhode Island. The proportion of college students was one for every 1,286 inhabitants of the North Atlantic division: 1,600 South Atlantic; 1,273 Northern Central; 1,532 Southern Central; and 1,031 Western division.

Capt. Howard Patterson's 'Yachtsman's Guide' (New York, 26 Burling Slip) contains a diversity of matter interesting to a yachtsman, whether he be a beginner or an old hand at the sport. The chapter on navigation is set forth with a simplicity which is a relief, after scanning the usual voluminous works on the subject. Much of this book, however, speaks to the merchant-ship captain rather than to the yachtsman, and might well be curtailed or omitted, while more space could be advantageously devoted to "marlinespike seamanship," in which few yachtsmen are well schooled. Taken all in all, the 'Yachtsman's Guide' is a convenient book of reference for the amateur sailor, and a good introduction to the study of navigation and seamanship.

Publishers, artists, and printers have done their duty by Mr. McAnally's 'Irish Wonders: Popular Tales as Told by the People' (Boston: Houghton, Mifflin & Co.). That is the best we can say for the book. The folk-lore of a people is perilous ground for an author who has no special qualifications for the task. It is not a subject that can be trifled with. These rehashes of Irish, or supposed Irish, myths and legends are wanting in the directness, simplicity, verve, and reserve that characterize the folk-lore of the country; while the representations of scenery are for the most part unreal and distorted.

In announcing recently Mr. W. E. Henley's forthcoming biography of Alexandre Dumas, we remarked that there was no wholly satisfactory life of the author of 'Monte Cristo,' even in French, though there is no lack of attempts to supply one. The latest of these, and probably the emptiest, is M. Philibert Audebrand's 'Alexandre Dumas à la Maison d'Or—Souvenirs de la Vie Littéraire' (Paris: Calmann Lévy), against which we warn all admirers of Athos, Porthos, and Aramis, the three musketeers (who were always four). It purports to give an account of *Le Mousquetaire*, Dumas's daily paper; but it contains almost nothing of value.

A Belgian astronomer, M. Houzeau, has published the second volume of a 'Bibliographie Générale de l'Astronomie.' It consists of 2,300 pages, and gives the titles of 35,000 papers on astronomy which have appeared in periodicals since the year 1666 to the present time. The first volume will contain a list of all the single works on this subject, and, it is expected, will be published during the present year. A third and concluding volume will appear in 1889, and will be devoted to lists of astronomical observations ("alle bisher stattgehabten astronomischen Beobachtungen").

Belford's Magazine enters the arena next month, published by Belford, Clarke & Co., at 384 Broadway, New York, and edited by Donn Piatt. It is avowedly to be a Democratic and Administration periodical, and its list of contributors, including Mr. D. A. Wells, Mr. Frank H. Hurd, Prof. W. G. Sumner, Mr. J. S. Moore, Mr. Henry George, etc., plainly shows a combative intent on the political side. But fiction, poetry, general literature, science, and art come within the scope of this monthly.

A new monthly periodical, *Science of Photography*, has been issued this month by the well-known Philadelphia firm of opticians, James W. Queen & Co., Philadelphia.

New, likewise, is the *Cornell Magazine* for May, and typographically quite in the front rank of college periodicals of the same class. It aims to strengthen the bond between the alumni and the University. The opening article, by President Adams, is on the "Successes and Failures of College-Bred Men."

From a circular accompanying the *Lincolnshire Notes and Queries* for April it appears that a movement is on foot to form a Lincolnshire Record Society for the printing of histo-

rical documents such as abound in the country. The membership will be on the guinea basis, and subscribers alone will receive the annual volume contemplated. Those who desire to help found the Society should forward their names to the Rev. John Clare Hudson, Thornton Vicarage, Horncastle, England.

"A Glimpse of North Africa" is the title of an article in the *Contemporary* for April by Grant Allen, in which he contends that all of the region between the Syrtis and the Atlantic is in fact European, both in its fauna and flora and, with some trifling exceptions, its people, and not a part of the Dark Continent. In regard to the latter, he instances the Kabyles, who are, at bottom, European in habits and manners, with a thin veneer of Mohammedanism. He energetically defends the French from the accusation of being poor colonizers, describing briefly their half-century work in Algeria—a work which they are also successfully doing in Tunis, and which, he hopes, no narrow international jealousies will prevent their doing in Morocco. He compares the environs of Algiers with the country for ten miles about Montreal or Toronto, to the great disadvantage of the latter. There are "no wooden shams, no flimsy makeshifts" here. Indeed, he goes so far as to say that there is "no town in any English colony . . . half so much like England as Algiers, with its stately boulevards and splendid warehouses, is like Marseilles or Toulon."

The French Association for the Advancement of Science has recently held its meeting at Oran in Algeria, and the *Revue Scientifique* for March 31 contains the address of the President, M. Laussedat, on "The Civilizing Influence of Science." A previous number contains a paper, read before the Association by M. G. Rolland, on the commercial and military value of the "lignes de pénétration" in Algeria, or the railways which run directly south from the Mediterranean, especially that in the eastern part of the province, which is to connect Constantine with the new oases created on the borders of the Sahara. The fear is expressed that the Italians will construct a line south from Tripoli, and divert all the trade of the western Sudan into that country.

The publication of Hessels's recent work, 'Haarlem the Birthplace of Printing, not Mentz,' of which note has already been made in these columns, bids fair to revive an old controversy and give it a new lease of life. In the January number of the Dutch periodical, *De Gids*, Professor Fruin of Leyden discusses the question and reviews the work of Hessels, but dissents from his conclusions, declaring frankly that, in the light of the evidence at present available, the outlook is much more favorable for the claims of Mentz than for those of Haarlem. In the March number of the *Centralblatt für Bibliothekswesen* it is stated that Hessels is preparing a Dutch translation of his book, in which he will take occasion to reply to the arguments of Fruin; and the editor of the *Centralblatt* promises his readers (in case Hessels then makes a definitive statement of his hitherto somewhat fluctuating opinions) an extended review of the work by a Dutch scholar, to be followed by a rejoinder from the German side. Van der Linde, to whom Hessels has boldly thrown down the gauntlet, accusing him not only of ignorance, but of wilful misrepresentation and suppression of facts, is still to be heard from.

In the March issues of *L'Art* (Macmillan) the most interesting illustration is a copy of one of Rowlandson's social satires, "The Extravagant Wife," a large full-page drawing with wash and pen and ink; the heroine deliciously rendered. To the same age of caricature belong half-a-dozen portraits of French artists at Rome just before the Revolution of '89, executed by Germain Drouais, a favorite pupil of David's cut off in his prime. A photochromotype of an old binding in red and gold is a fine example of the perfection to which this kind of facsimile has been carried.

B. Westermann & Co. send us two more numbers (20 and 21) of the 'Geschichte der deutschen Kunst,' with the customary profusion of illustrations; and the first number of the fourth edition of 'Meyer's Hand-Lexikon des allgemeinen Wissens.' We are truly sorry to see the enlargement in form thought necessary for this reissue of a work of singular utility. The third edition we have been using with the greatest satisfaction for five years, with constant admiration for the compactness of its wealth of information, its handy size, its admirable typography. To have made three or four volumes of the two would have seemed the proper thing. Instead, it has been thought advisable to resort to the octavo shape, and the handbook we have denominated for ourselves the "little giant" of encyclopædias thus loses its outward identity. Chromos, too, after the fashion of the larger Meyer and Brockhaus, make their début among the illustrations; the maps take on a larger scale. The most regrettable change of all is from the Roman to the less legible Gothic letter. That the contents will show an improvement and enlargement upon the third edition, there can be no doubt.

An imperial or half life-size photograph of Edwin Booth comes to us from F. Gutekunst, Philadelphia, and it is the freshest portrait of the tragedian as it is one of the best and most impressive. It is worthy of Mr. Gutekunst's high standard of excellence in his art, and forms a notable addition to his gallery of American celebrities.

We observe with gratification that the friends of the veteran English reformer, Mr. George Jacob Holyoake, are endeavoring to purchase an annuity for him to eke out his income for the remaining years of his life. Remittances may be sent to Mr. Marsden, 43 Doughty Street, London, W. C.

—The May *Atlantic* is made up of fiction and a number of excellent essays. There is no poetry, and this would be a welcome incident if it could be taken as a sign that as rigid a standard is to be applied to verses as is imposed upon prose. There is no excuse for the marked difference to be observed in the magazines between the quality of what they are willing to publish as prose, and that of what they admit provided it is rhymed. It seems to be a common notion among editors that verses enjoy an exemption from the requirement of excellence. Occasionally this perversion of judgment goes so far that if a poem is especially vapid or foolish or crazy, or a writer has a real genius for crankiness, such are preferred, as if to remind us how savage tribes respect some specially distinguished idiot. Every month poems are published in our leading magazines which would never have had a moment's attention if they were treated as prose articles are, and examined as to their excuse for being by ordinary literary tests. The result of this laxity in the standard is apparent in the hundred versifiers who make up the poetic staff of the monthlies, and whose work is without literary distinction. Excellence in poetry is now hardly looked for, while on the other hand the high grade of our journeyman prose is often remarked upon, and good writing is so much expected that it surprises no one. The *Atlantic* has held to a better standard than the other magazines hitherto—partly, no doubt, because of its strong traditions. If this unpoetic number inaugurates the old policy in even a stronger form, so much the better. The essays this month are more noticeable because of the absence of the poems, but they bear closer attention easily. The sketch of the late Emperor William by Prof. Herbert Tuttle is a very unusual paper, defining his personality and the character of his reign clearly and broadly, and without any concession to the eulogy of the hour. He shows us the man behind the great imperial figure, the strong qualities, the narrow ideas, the combination of drill-master and *grand monarque* and old Prussian baron, and he reminds us that the Emperor was the enemy of constitutional liberty in a way that military glory has taught us too readily to forget. The sketch of Cicero, based upon his letters, is a pleasing classical paper. Mr. Cook drafts the main features for a reformed Marriage Law. "The American Philosophical Society" affords a view of old Philadelphia worthies; and there is plenty of other matter less grave than these leading articles.

—*Harper's* has an interesting series of twenty-seven portraits of literary celebrities in London, and a larger number of persons are dealt with in the article which furnishes the text, and which is confined practically to biographical details. Perhaps the most marked impression made by the comprehensive view of literary England thus given consists in the undeniable inferiority of the generation next to Tennyson, Carlyle, and Newman in respect both to genius and achievement. This decline of literary power is indubitable now that the roll of men is really made up for the latter Victorian period, though the reasons for it have hardly yet become a matter of speculation. The novelists, it is true, are not included in this survey, but examination of their claims will not alter the result. The remainder of the number is not of more than average interest. Chicago and Denver are described as examples of the triumph of material civilization in the West, and perhaps there is a slight ray of promise of other things in that part of the country in Mr. Warner's opening sentence, "Chicago is becoming modest." But as the author states its principal claim to distinction to be its having "the greatest merchant in Dry-goods, the greatest dealer in Clothing, the greatest Packer in the country, and probably in the world," there is possibly a touch of optimism in his startling prologue. One is inclined to take this view all the more because he apparently refers the city's "modesty" to its astonishment at its own greatness; nothing else, one feels sure, could overawe it and bring about such an unaccustomed frame of mind. Chicago is becoming self-reliant in the same sense that older cities and Americans in general are, because they no longer have that doubt of their position which leads men to make self-asserting claims; but modesty is a different thing. Two articles upon Russian affairs, with respect to the Nihilist prisoners, counteract Mr. Kennan's views in the *Century*, though the second one, upon Russian law, presents practically the same state of affairs, so far as the character of the trials is concerned, and says plainly that political offenders are outlawed because the charge against them operates to destroy the ordinary rights of accused persons in their cases. But, in reading the more favorable accounts of the organization of justice for other offences, it is needful to remember that the administration is of more consequence than the system, under arbitrary rule.

—With the April number of the *Harvard Law Review* begins the second year of that "Monthly Journal of Law published by Harvard Law Students." We called attention to one or more of its earlier numbers, and are now able to praise heartily the general results of the first year's work of this really valuable journal. The first number of the second volume is marked by learning, and by clearness and accuracy in the discussions of important subjects. Indeed, the leading article by Professor Ames on the "History of Assumpsit"—the first of a series—is a very remarkable paper indeed, and would give distinction to any law journal. The writer has thoroughly searched our older law, and presents compactly and with great force and skill the results of his study of the authorities in their historical order. The paper is not of a sort to be abstracted here; its general scope, however, may be indicated by saying that it deals with the origin and import of assumpsit, and of consideration in our law of contract. The author holds it "impossible to refer consideration to a single source. At the present day it is doubtless just and expedient to resolve every consideration into a detriment to the promisee incurred at the request of the promiser. But this definition . . . would not have covered the cases of the sixteenth century. There were then two distinct forms of consideration: (1) detriment; (2) a precedent debt. . . . The history of detriment is bound up with the history of special assumpsit, whereas the consideration based upon a precedent debt must be studied in the development of *indebitatus assumpsit*." Professor Ames's conclusions as to the origin of special assumpsit, viz., that it is traceable to the action on the case for deceit, agree with those of Judge Hare in his recent book on contracts. This is the more interesting from the fact that they were worked out and in manuscript, as the writer informs us, before that excellent book was published. The argument tends to disprove the doctrines of consideration put forward by Mr. Justice Holmes and by Mr. Salmond, a late writer in the English *Law Quarterly Review*. Besides this thorough and admirable piece of legal investigation, the *Review* contains interesting articles on "The Principle of Lumley vs. Gye, and its Application," by William Schofield, Instructor in the Law School; and on "The Right to follow Trust Property when confused with other Property," by Samuel Williston, a member of the third-year class in the School.

—In an editorial paragraph of the last *Modern Language Notes* we read as follows:

"'Wie Georg Brandes deutsche Literaturgeschichte schreibt' is the title of a highly interesting article in the last number of Herrig's *Archiv*, written by Dr. Puls of Flensburg. The Danish essayist and critic, who has hitherto in certain circles passed for a great scholar, and who, on account of the supposed profundity of his knowledge, was allowed to express radical opinions and offensive criticism, is now suddenly exposed as a literary plagiarist of the worst sort. . . . The result . . . develops the fact that Brandes not only did not read the sources necessary for writing an original history, but that he has copied, in many passages verbatim, from the works of German investigators like Haym, Goedeke, Hitzig, etc. Had Brandes concealed his fraud in the comparative obscurity of the Danish language, he might, perhaps, never have been discovered. But he had his book translated into German, thus giving another illustration of the not unfrequent phenomenon that scientific ignorance and incapacity are coupled with the impudence and *sangfroid* properly belonging to criminals."

As we have long held, and have occasionally expressed in these columns, a rather favorable opinion of Brandes's literary work, we were somewhat perturbed by the above quoted remark; so we hastened to Herrig's *Archiv* to find out what Dr. Puls had discovered. And what we find out is, that, while the case has its mysterious and depressing aspects, it is, at any rate, not quite as bad as the *Modern Language Notes* would have us suppose. Dr. Puls's charges are based upon what he finds in the second volume of the new edition of Brandes's well-known work, 'Die Hauptströmungen der Literatur des neunzehnten Jahrhunderts.' This volume appeared last year at Leipzig. It calls itself an "original work," this phrase meaning that it is no longer simply Strodtmann's translation from the Danish, but is this translation revised and amplified by Brandes himself. Strodtmann's translation appeared in 1873.

—Dr. Puls begins his attack thus: "Brandes citiert, Seite 122, aus Wackenroder, 'Die Kunst ist eine verführerische, verbotene Frucht; wer einmal von ihrem innersten, süssen Safte gekostet, der ist unwiederruflich verloren,' etc." In the original of this passage, observes Puls, we find instead of "süssen" "süssesten," instead of "gekostet" "geschmeckt," and instead of "unwiederruflich" "unwiederbringlich." From these and other similar "disfigurations" Puls infers that an author who could so misquote must have been very careless, or else could never have seen his original. Upon turning to Strodtmann's translation, however, we find these "disfigurations" are there also. We have not the Danish edition of Brandes's work at hand, but we presume the case was simply this: Brandes first rendered his German quotations into Danish, then Strodtmann translated this Danish back into German of his own, without taking the trouble to look up the original; finally, Brandes, in revising his work, has not thought it worth while to go through it and correct his translator's translations. Here, surely, is neither immorality nor gross carelessness; so this category of Dr. Puls's charges becomes rather vacuous. With regard to the plagiarisms the case is not so clear, though here, too, a really decisive verdict can be given only after a comparison of the Danish edition with Strodtmann, and this in turn with the new revision. For the most of Puls's parallel passages we find in Strodtmann, who would seem to be, in some cases at least, responsible for the particular turn of phrase that has excited the German Doctor's suspicions. Further, we notice that Brandes occasionally refers to Haym; in one place we find the parenthesis, "as Haym has shown," right between two of the passages excerpted by Puls as plagiarisms. Dr. Puls might very properly have mentioned this fact. There are also some further palliating considerations for which we have here no space. In spite of all that we have discovered, however, we admit that the matter has a decidedly unpleasant appearance, and we shall look with interest for Brandes's explanation of it. Meanwhile, we had rather not take the responsibility of using such words as "fraud," "ignorance," "incapacity," and "impudence" in connection with the name of a man who has shown himself capable of such admirable literary work as Brandes has done, and done in considerable quantity.

—One of the recent publications of the Oxford Historical Society (Clarendon Press; New York: Macmillan) is entitled 'Letters of Richard Radcliffe and John James of Queen's College, Oxford, 1755–'83.' The correspondence is edited by Mrs. Margaret Evans, and many notes and appendices are supplied by the Provost of Queen's. The greater part of these notes are merely extracts from registers and other official memoranda, and are therefore of interest only to those in some way concerned with the Queen's College genealogy. They are the product of the most elaborate and painstaking research, but they cannot be said to give a very clear picture of the life at Oxford in the last century. The letters themselves are deficient in this respect, and almost the only definite impression to be derived from them is of the outrageous character of the collection of mediæval practices which then constituted an Oxford college. Frequent allusions show the bitter resentment of the writers at the desperate and humiliating struggle for preferment which was a necessary feature of the oligarchical administration of Church and University. In spite of all abuses, however, a very high degree of culture was somehow obtained, as these letters abundantly show. They are full of graceful humor, and are remarkably fresh and modern in tone. In fact, they interest us more in the personality of the writers than in the life at Queen's College. The spelling, it may be observed, varies extremely little from the present standard.

—A product of the same pious spirit is 'Yale and her Honor-Roll in the American Revolution,' by Prof. Henry P. Johnston of the College of the City of New York. In this case, however, the design is not to throw light upon the college life of the day, but to trace the connection of the graduates and students with the Continental Army. The College itself was compelled to close its doors during the early years of the war. Of the class of 1775 nearly twenty are known to have entered the military service of their country, and the other classes of about that time were drawn upon almost as heavily. Mr. Johnston computes that there were about 900 graduates living at the outbreak of the war, and that altogether the number who took some part in it was nearly 240. At least fifty-five are known to have been engaged at Boston and other points in 1775, and in the following year the number increased to about seventy-five. The nature of the controversy was such as to appeal to men of education especially, and they certainly seem to have appreciated their responsibilities. In the absence of a military class, the men of college training were naturally selected as officers, and in the list of those serving in 1776 only three out of seventy-five appear as privates. Considering the poverty of our early military records, Mr. Johnston has been surprisingly successful in making out his biographical sketches, and he is able to give some details of the lives of more than four-fifths of those who are believed to have done military service. A few original letters are printed, and the chapters upon the several years of the war, which are intended to show the careers of the more prominent Yalensians, permit the introduction of something like continuous narrative. Mr. Johnston deserves the thanks of all loyal Yale men for his generous labors, which his familiarity with the manuscripts of the Revolutionary period renders especially productive. The volume is a very handsome one, and contains two steel portraits, one of Oliver Wolcott, the other Trumbull's fascinating head of Col. Tallmadge—certainly a work of genius, whatever may be said of the other works of that artist. The book is privately printed, but may be obtained of G. P. Putnam's Sons.

—The sixth and seventh volumes of Franklin's Works as edited by Mr. John Bigelow (Putnams) cover the years 1776–1782, all but the first spent in Paris as Commissioner to France from the Congress of the United States. The multitude of cares incurred in this service furnish the staple of the correspondence in these volumes. Conspicuous are those to and from

his exasperating colleague, Arthur Lee, to whom Franklin's plain English is as refreshing as it is in the case of Capt. Landais, after the latter's falling-out with John Paul Jones. We get a glimpse of the nuisance caused by Frenchmen desiring to be recommended as officers in the American Army, and of Franklin's consummate tact in this as in all other matters —a tact absolutely divorced from duplicity. There is but little that relates to science. Curious is Franklin's proposal that pikes and crossbows should be employed against the British musketry. In France he reports that the ball head-dress of women is from five to seven face-lengths high. He records very minutely the state of his health at this time of his life, and satirizes himself in the sprightly dialogue between himself and Mme. Gout. We meet here with references to the monument to Gen. Montgomery now in the rear of St. Paul's Church in this city, which was shipped from France by way of North Carolina, well packed, as he affirms and as its present condition proves. There is a letter to "Master Johnny," the future second President Adams. Among the tales and apologues assigned to these dates we find the famous two about the whistle and about substituting sunshine for candlelight. Franklin declines to pass judgment on the feeble efforts to turn into French verse Turgot's eulogistic line, "Eripuit coelo," etc. A commonplace occurs in the letter of February 8, 1777, to Mrs. Thompson, who had called him a rebel: "You should wait for the event, which will determine whether it is a *rebellion* or only a *revolution*." A now obsolete sense attaches to the word he italicizes in the sentence: "We consider it a sort of *tar-and-feather* honor, or a mixture of foulness and folly," etc.

—Our knowledge of the earliest form of Irish speech is derived from interlinear glosses written by Irish monks in Latin manuscripts. Upon a study of such glosses was based the 'Grammatica Celtica' of Zeuss-Ebel. Prior to 1881, however, no systematic attempt was made to publish the glosses and thus render them accessible to all. In that year Zimmer brought out his 'Glossae Hibernicae' (Berlin: Weidmann) under the auspices of the Berlin Academy. The volume contained the readings from twenty-three MSS. The *codex princeps* was the Würzburg MS. of the Pauline Epistles. Zimmer's treatment of this was sharply attacked by Whitley Stokes, who published in 1883 a formidable list of errors and omissions, based upon a collation of the MS. Latterly Stokes has brought out his own edition of the Würzburg MS. (including also the Carlsruhe MSS. of Priscian's 'Institutiones,' Beda's 'De Rerum Natura' and 'De Temporum Ratione,' and of one of Augustine's writings, under the title 'The Old Irish Glosses of Würzburg and Carlsruhe,' for the Philological Societies of London and Cambridge (Trübner & Co., 1887). The Augustine glossae were edited in 1884 by Windisch, and are included in the present volume for the sake of completeness. Stokes's readings are undoubtedly an improvement upon Zimmer's, and they have the additional advantage of offering throughout an English translation of every Irish form. The editor has in hand a second part, to comprise an Introduction and Glossarial Index. The latter term has to us a slightly ominous ring. The Early English Text Society has published more than one glossarial index that fell short of the mark. What we need, and hope to see, is an *absolute concordance*. And we also hope that Stokes will give us a grammar of Oldest Irish, akin to those of Braune, Noreen, and Sievers for High German, Icelandic, and English.

TOLSTOI'S PHYSIOLOGY OF WAR.

The Physiology of War. Napoleon and the Russian Campaign. By Count Leo Tolstoi. Translated from the French by Huntington Smith. Thos. Y. Crowell & Co. 16mo, pp. ix, 190.

In this little work Tolstoi has formulated his philosophy of war, giving us his theory separated from the practical and realistic details so vividly drawn in the well-known chapters of 'War and Peace.' It is only as doctrine, therefore, and not as literature, that we have now to consider Tolstoi's ideas. He teaches the opposite of Carlyle's theory of human nature and history, as developed in 'Heroes and Hero Worship.' With him the so-called great man counts for little or nothing, the nation and its environment for everything. He pushes the doctrine of natural evolution in history far beyond Buckle, and makes everything that happens the inevitable outcome of the development of great masses of men under the doctrine of natural selection—the apparent leaders being the mere bubbles of froth on the great current of human destiny. He asserts that "the progress of events is inevitable; that it is a result of the combined volition of all who participate in the events, and that the influence of Napoleons upon the progress of affairs is superficial and fictitious."

He is so sure of his principle that he no longer holds it as an inductive conclusion from facts, but boldly tests a narrative of facts by *a priori* deduction from the principle, saying that "if, in the accounts of historians, we see that wars and battles are invariably carried out in accordance with plans made in advance, the only conclusion that I can come to in regard to these historians is, that their descriptions are not true." Applying it to Napoleon in the Russian campaign, he says: "We imagine Napoleon to have been the director of all these movements, just as the savages imagine the figurehead upon the prow of a vessel to be the power that moves it onward. Napoleon, through the whole of this campaign, was like a child seated in a carriage clasping the sides, and imagining it is he that makes the horses go."

The question whether Napoleon in Russia in 1812 was the Napoleon of the Italian campaign of 1796 loses all significance, for the sweeping principle is applied to the first as to the last of his campaigns. "The excellent quality of his army in Italy," he says, "the disinclination of the enemy to fight, his confidence in himself and his puerile effrontery, give him military glory. A multitude of so-called happy accidents meet him everywhere." From first to last, it is all lies and shams, pretence and puerility; and when the end comes at St. Helena, "the true dispenser of events, having brought the drama to an end, takes away the mask from the principal actor, and reveals his face, saying, 'See in whom you have believed! Here he is. You see now that not he but I led you!'" Nor does Tolstoi stop here. What is true of Napoleon is also true, though stated in more measured terms, of Peter the Great and of Alexander the Czar, of the King of Prussia, and of the Emperor of Austria.

The logical outcome of such doctrine must be that not only among those called great leaders, but in all degrees down the whole scale to the lowest, all pretence of controlling or guiding must be a sham. The man who assumes to guide a village coterie or a knot of disputants at a pot-house, is neither more nor less of a fraud than the Napoleons. There is no guidance, no leadership anywhere, in action or in thought; the instincts of the mass impel them onward, the direction of the movement is determined by the environment, the environment itself is determined by the fatal concourse of all preceding material and moral forces. The campaign of Moscow, like the armed migration of Attila and his Huns, should be likened only to those migrations of ants which travellers in the tropics tell of, which go on in endless columns, stopping for neither rock nor stream, till their destiny is accomplished, perhaps by their destruction in some river or gulf into which they are blindly precipitated.

Tolstoi does not develop his theory to this logical conclusion, for that would be, to most of his readers, its decisive confutation. We may reasonably doubt whether he is not conscious of the danger of the ground he is treading on, and whether there may not be reasons, in the task of helping his countrymen onward towards a true political and social progress, why he may voluntarily choose an exaggerated mode of expression, a sort of deification of the multitude at the expense of all leaders, which may make more palatable the protest against the autocratic Government of Russia that is to be read in every line. The fate of the so-called Nihilists is sufficient warning that he who strives to reform the Government must choose cautiously his means and his words. By making the Muscovite people a great organized being, having its aspirations and its possible destiny determined by its innate character and activities, the whole so much greater than any of its parts that even a Czar is only its organ of action and necessarily obedient to the physical laws of the whole body, he may give shape to the patriotic pride of each individual, and induce even the Czar himself to find a satisfaction in putting away the proud illusion that his brain and will govern Russia, and in accepting the nobler office of heading a freer development of the nation through progressive representative institutions. It is no new thing for the advocate of dangerous truths to shelter himself behind an exaggerated form of received doctrine. A famous example was that of Brougham in his defence of Queen Caroline, who, when loyal Englishmen stood aghast at the blows he struck at enthroned corruption—

> "—— what seemed its head
> The likeness of a kingly crown had on"—

took refuge behind a doctrine of the duty of counsel to his client, so distorted and magnified that it has ever since been a popular paradox of the debating schools.

We Americans are so used to the idea that the people as a whole are greater than any ruler, that if familiarity has not bred contempt, it has at least made us quite ready to see and acknowledge the limitations of the truth. No intelligent man among us fails to see that there is room for true leadership in the most democratic of institutions. No political philosopher of the Old World could teach our average citizen much in regard to the vital distinction between a mob and a nation. Organization has become among us a sort of instinct, and able European writers have recorded the fact that when a crowd of civilized men came together at the gold placers in the wilds of Australia, a few Yankees became at once the centre and nucleus of a practicable municipal organization, which gave immediately to a shanty town much of the civil order and safety of an old community. Our democracy, therefore, is the furthest possible remove from anarchy, and is instinctively and unrelentingly hostile to it. We demand that our officers of state shall be absolutely obedient to the Constitution and the laws, and make the common weal the *suprema lex* in a fuller and wider sense than foreign jurists have done; but we also recognize clearly the scope and

place for highest intellect and solidest character in those who, in our phrase, are called to do the people's will. We know there is room for highest leadership in the sphere of a President, a Governor, a Mayor; and the intelligence of the country knows that it is cheated just so far as unscrupulous and selfish demagogy usurps the place which born leaders should fill.

Trained in this practical school, our scholars, also, however explicitly they may accept the doctrine of evolution in history, will not accept Tolstoi's theory that a great figure in human affairs is only a gaudy fly on the chariot wheel. The condition of a people may be the result of their environment acting and reacting upon their inherited character and tendencies, but the advent of a great intellect and will is an essential part of the complex situation which we cannot for a moment afford to overlook. The progress of science in the eighteenth century would not have been the same if Newton had not lived. He, with his inherited and acquired powers of mind, was a positive force in his generation. The world of thought *minus* Newton would not have been the world it was, and its achievements neither would nor could have been the same unless you supply a precisely equivalent genius in his place. France *minus* Napoleon would not have been France *plus* Napoleon. If Napoleon had been a Washington, the combination of elements of force and of morals would have been still different, and the resultant historical progress of events must have been different as certainly as a different combination of elements would produce different results in chemistry.

This view of evolution takes account of a great man as an element of real power and influence in human society, which Tolstoi's does not. It is not necessary to argue that he is omnipotent any more than that he is a nonentity. Take him for what he really is; study his character and his mind; learn his powers and his weaknesses; estimate his weight in the scale relatively with others; reduce his pretensions to the measure of his actual accomplishment; but when you have done all this, remember that just to the extent in which you have found him stronger, greater, better, or worse than his fellows, you must estimate him in the equation of forces that move the people of his time this way or that.

If one might press the argument home, it would be fair to ask Tolstoi, Why are you wearing out your intellect, your great human sympathies, your pride of race, and practising self-immolation to the aspirations and hopes of the Russian people? If it will be the same to them whether you write or are silent, if you are not a force in your time, but only one of the bubbles upon the resistless river, why not push back the writing-table and quit the useless effort? The answer is, that the famous writer feels that, in spite of his theory, he is and may be a power in the settlement of the great problems with which his country is rocking and heaving. He is conscious, after all, that a true man counts for much in such a struggle, and in his heart repudiates the thing his lips preach, viz., that his influence is only as one to the total number of heads enumerated in the census.

It would not be difficult to show that the exigency of supporting such a thesis has led Tolstoi into an untenable depreciation of the powers of Napoleon, even in the campaign of Moscow. But as he has generalized upon all the events of that period, so as to include in the same judgment all prominent men of all nations, and Napoleon at all the periods of his career, it is better to limit our criticism to the theory propounded and to fairly drawn conclusions from it. By so doing, we are able to find a philosophical basis for estimating every man, in his influence upon his epoch, according to his individual qualities and powers; and to vindicate the judgment which the common sense of all peoples and all ages declares, that full responsibility rests upon every son of Adam, not only for the good or the ill that he may actually do, but for the fullest cultivation and the noblest use of all the powers with which he has been endowed.

RECENT FRENCH BOOKS.

THE 'Histoire de la Civilisation contemporaine en France' of M. Alfred Rambaud (Paris: Armand Colin & Cie.) is the third and concluding volume of the series of which the same writer's 'Histoire de la Civilisation française' forms the two earlier volumes. The 750 very solid pages of the present work contain a summary exposition of the progress of France during the last hundred years in government and administrative institutions; in moral, political, and economical ideas; in letters, arts, and sciences. The various chapters which describe this progress follow each other in the same order, and under similar headings, in each of the three periods into which the work is divided: the revolutionary governments (1789–1814), those of restricted suffrage (1814–1848), those of universal suffrage (since 1848). Imperfect as is this grouping of the Revolution with the Consulate and Empire, of the Restoration with the Monarchy of July, of the Second and Third Republics with the Second Empire, the advantages are so great that possibly no wiser distribution of the material could have been made. As a book of reference, M. Rambaud's work is excellent—concise, clear, complete, and very readable. The whole story, for example, of the political changes in the forms of government in France since 1848 is told in a dozen pages—in the first section, "Les Constitutions," of Part III—without the omission of any essential step, and with no attempt to relate the history of the period. The same may be said of the chapter, in each of the three parts of the work, on "L'Instruction publique," and of that on "L'Administration, la justice, les finances, les cultes." M. Rambaud is a sincere republican, but his work is never partisan in its tone even in the most political of its chapters. It may even be called unprejudiced and impartial as far as it was possible for a writer to make it so when treating of matters in which he felt such a personal interest.

In 1884, Mme. Michelet published a volume of the personal recollections of her husband under the title 'Ma Jeunesse,' made up, as she informs the reader in her preface, from the abundant notes and journals left by him. It is the story of the childhood and youth of the historian as he recalled it at different periods years afterwards, much of it when he was forty and fifty years old. She has now published a second volume of these "souvenirs de jeunesse," as she calls the whole work, under the title: 'Mon Journal, 1820–1823' (Paris: Marpon & Flammarion; Boston: Schoenhof). These dates of the title page are not exactly correct, strangely enough, for the journal closes November 8, 1822, and the few and scattered entries of the last year fill only twenty-five pages of the volume. The Journal itself is supplemented by what is called the "Journal de mes idées," extending from 1818 to 1829, and filled with Michelet's projects of literary work, and also by a list of the books he read during the same period, set down methodically under months, sometimes with the exact dates. The whole forms a singularly instructive account of the mental and spiritual development of one of the most individual writers of the present century.

Michelet began his Journal, he says in a letter to his friend, Poinsot, in the hope that if he should die first it would add to his friend's knowledge of him, "et que je vivrais encore dans ta pensée par une sorte de présence réelle." Paul Poinsot was at this time completing his studies in medicine as an *interne* at the hospital of Bicêtre. He was Michelet's most intimate friend from the days of their childish companionship, related in 'Ma Jeunesse,' until his early death, less than a year after the Journal was begun. Its pages are filled with their friendship while he lived, and with a kind of spiritual communion on Michelet's part afterwards—partly memory and partly aspiration—the record of which has all the tenderest and most touching qualities of his later writing, but is more subdued and more reticent in manner.

Poinsot went to live in Michelet's family in 1818, and the two years that followed were passed by the young men in the closest companionship. When this life in common came to an end, May 4, 1820, Michelet accompanied Poinsot to Bicêtre, and then, returning to the study his friend had occupied next his own chamber, he wrote there the first pages of the Journal which Mme. Michelet now gives to the world after almost seventy years. Every Sunday morning Michelet walked to Bicêtre and spent several hours with Poinsot, for the distance was so great and the days were so filled with work and study that he could spare no other time for these visits. Frequent letters passed between them during these intervals of separation, which are given in the volume between the dates of the Journal where they belong. At the same time with these letters and with the Journal, which is a record of his thoughts and feelings rather than of events, Michelet began what he named the "Mémorial," in which he recalled the events of his childhood and early youth. This also was undertaken for his friend. It was never finished, but the portions of it which Mme. Michelet has given in 'Ma Jeunesse' have great interest and beauty of an austere and elevated kind.

The two volumes of these "souvenirs de jeunesse" already published make one of the most interesting of autobiographies, ending when Michelet, then little more than twenty-four years old, was appointed professor of history at the Collège Sainte-Barbe. With his entrance upon this new life his Journal was laid aside, and apparently not again taken up continuously until 1838, after his ten years as professor of history and philosophy at the École Normale were over. These ten years of his life are the subject of a third volume announced as already in press: 'L'École Normale, 1827-1837.'

Almost all the forms of constancy have a charm of their own, and the happy author is, perhaps, no less than the happy warrior, he who in maturer years

> "hath wrought
> Upon the plan that pleased his earliest thought."

This charm is possessed by the volume of M. Albert Desjardins' 'Les Sentiments moraux au XVIe siècle' (Paris: G. Pedone-Lauriel; Boston: Schoenhof). Seventeen years ago he published a smaller work, 'Les Moralistes français au XVIe siècle.' Since then he has written much on Roman, French, and English law, ancient and modern, civil and ecclesiastical, for he is a professor in the Paris Faculty of Law. Now he returns to the study of the moral

conditions of the sixteenth century, and returns to it with an intelligence broadened and strengthened by these intervening years of life and reflection. In his own words: "After having studied the moral doctrine of those who wrote in France in the sixteenth century, we desire to study now the moral sentiments of those who lived and acted in this same country, at this same time." This subject is more interesting than the former one, and the present work is in every way superior to its precursor; superior in expression, in scholarship, and in thought. It is not only excellent in all these respects, but it is full of interest as well. The first book was one not to be found fault with; this is one to be praised.

Another and a very different book upon the sixteenth century is 'Les Mœurs polies et la Littérature de cour sous Henri II.,' by M. Édouard Bourciez (Paris: Hachette; Boston: Schoenhof). This title promises much, but the volume gives more than it promises. The reader has an agreeable disappointment in finding that "les mœurs polies" include tourneys and huntings, religious processions led by the King, and the spectacle of the punishment of heretics; the wild beasts of the royal menagerie, the court fools and dwarfs, and the first Moorish ambassador. The literary chapters are not less widely inclusive. There are examinations of the 'Amadis' and of its imitations, of French poetry before the days of Ronsard, and of the work of Ronsard himself and of his associates. These give occasion for sketches of court personages who, while fostering the Renaissance, were themselves educated by it into conditions of feeling, and even conditions of action, previously unknown. M. Bourciez has blended into one homogeneous subject these studies of the literature, the manners, and the men of the court of Henri II. in a way that makes his book very attractive. With entire simplicity of phrase and quietness of tone he is never dull, as he rapidly presents his various topics with the ease of familiarity and without overcrowding and confusion, in the pictures which succeed each other. The work is of interest from another point of view. The author has made of it, in a certain manner, a kind of comment on Rabelais. Although that great genius himself does not appear personally, his life being before the period here treated of, M. Bourciez shows his readers that many of the ideas which found wide development and some realization later, existed intellectually and as vision in the mind of Rabelais; that he embodied the vague aspirations of his contemporaries, those men and women whom M. Bourciez describes as "among the most complex of beings; rooted in the past, dazzled by new illuminations, sensual and idealistic, striving to reason, and possessing, not infrequently by instinct, the sentiment of beauty."

The title of M. Oscar Méténier's 'Bohême bourgeoise' (Paris: Albert Savine; Boston: Schoenhof) indicates its subject with clever ability to say the thing meant—a quality to be found in many of its pages. The book sets forth the natures of people, commonplace and narrow in their education, in their points of view, in their habits of life; unrestrained and disorderly in their instincts and desires. The writer puts in the strongest light the heartlessness, the recklessness, the perverse and dissolute life of a middle-class woman, whose passions, even, are trivial and acquired, stimulated sometimes by curiosity concerning evil, sometimes by greed of money. This heroine resembles Mme. Bovary; but she is a Parisian, not a provincial Mme. Bovary, with something less fatally tragic in her composition than in that of Flaubert's miserable heroine. She resembles still more nearly M. Paul Bourget's Mme. Moraines, in 'Mensonges,' and the situation also, as far as she is concerned, is the same, but stripped of its deceptive sentimentality and external refinement. The hero is a *romancier* by profession, but neither commonplace nor disorderly. His sole passion is for truth in art, and he sees men and women and their conditions only as subjects for analysis. His cynicism is cold-blooded enough, and his excitements are only of the intellect, which renders the volume tolerably decent, though sufficiently disagreeable.

'Mensonges,' by M. Paul Bourget (Paris: Lemerre; Boston: Schoenhof), is the third of a series of novels by the author of 'Essais de Pyschologie contemporaine.' These are merely three different expressions of the same state of mind in the writer. Indeed, in all that is essential, 'Cruelle énigme' is the same story as 'Mensonges'; and if 'Un Crime d'amour' varies in any way, it is because the characters have changed sexes. The unquestionable ability and even talent of M. Bourget seem to be confined in these books—and he has written only one other novel—within the narrow limits of one situation and state of mind, presented by two actors who remain always the same, whatever characters they may assume. This monotony of subject is not redeemed by any brilliancy of treatment; the author of 'Mensonges' is not one of the great masters of French prose, like M. Guy de Maupassant or Pierre Loti—to take two extremes of manner in fiction. His influence over his readers is great, but is produced by causes of very unequal value. It is owing partly to a remarkable power of analysis of the feelings and passions which are his usual subjects of observation, partly to the tone of melancholy and disenchantment which is the characteristic mark of his style; but principally to an excessive sentimentality, the expression of which generally produces a strong effect when it seems to be sincere and deeply felt.

M. Bourget's sentiment and powers of analysis, however, are exercised upon subjects unworthy of his ability, subjects which, if treated at all, are only fit for the light and flippant irony of Gyp, whose last book, 'Les Séducteurs' (Paris: Calmann Lévy; Boston: Schoenhof), is not only much less false in feeling and portraiture than any of these more serious works, but is also much more healthy in its influence, however justly it may be taxed with impropriety and even indecency. This lively writer is not guilty of presenting Mme. de Flirt and Mme. d'Houbly and the rest of her young women with any appearance of a refinement and delicacy of feeling inconsistent with their shallow and vulgar natures, as M. Bourget does with his perverse heroines. Neither does she throw around any of their male companions the sentimental graces with which M. Bourget disguises the ugly reality of the selfishness, ingratitude, cruelty, and coarseness of his heroes. It is this false air of distinction, this representation of his personages as suffering from the refinement of their sentiments and feelings under the pressure of a cruel fatality, which excites the sympathy of his readers, and renders M. Bourget undoubtedly the most dangerous among the writers of fiction of the present day.

The novel of M. Bourget which immediately preceded 'Mensonges,' 'André Cornélis' (Paris: Lemerre; New York: Christern), differs from his other stories by the entirely altered atmosphere created by the more tragic passions of the characters. It is the story of *Hamlet* in a modern setting. The action centres in the innocence and unconsciousness of the mother during the years of suspicion and lingering projects of vengeance in the mind of the son, and of consuming remorse in that of the husband. The efforts of the two men to preserve the wife and mother from any suspicion of the crime which fills the lives of both; their exclusive and jealous love for her and silent watch upon each other, give occasion for the exercise of all M. Bourget's powers of analytical description. 'André Cornélis' has many fine points, many passages of great power; it is both well written and interesting, and still it was not a successful novel. That the author should have returned, in 'Mensonges,' to the weak and contemptible personages of his earlier books, was certainly a great mistake, for he has shown that he can do nothing more in that direction than to reproduce his first successes. His talent promised something more, when the 'Essais de Pyschologie contemporaine' appeared, than this very slender stream.

MR. LANG'S THEORY OF FAIRY TALES.

Perrault's Popular Tales. Edited from the original editions, with introduction, etc. By Andrew Lang, M.A. Oxford: Clarendon Press; New York: Macmillan. 1888. Square 8vo, pp. cxv, 153.

The Most Pleasant and Delectable Tale of the Marriage of Cupid and Psyche. Done into English by William Adlington of University College in Oxford. With a Discourse on the Fable by Andrew Lang. London: David Nutt. 1887. 8vo, pp. lxxxvi, 65.

ONCE before, fairy tales have been a matter of interest to mature minds, and a subject of more or less serious study on the part of men of letters. Strangely enough, this was during one of the most artificial periods in the most artificial society the world has ever seen; for it was at the Court of Louis XIV., where the prevailing ideas of nature and simplicity were reflected in D'Urfé's 'Astrée.' It was undoubtedly this very artificial state of society which made the artless fairy tale so welcome, and it did not take long to discover that princesses in the disguise of goose-girls, and princes transformed into beasts, could, with a little decking out, be made presentable at Court. We know from Mme. de Sévigné's letters that as early as 1676 fairy tales were told at Court, but they did not assume the form of written literature until near the end of the century. This is very strange, for in Italy, a land which so powerfully influenced French society and literature during the sixteenth and seventeenth centuries, fairy tales had been a part of literature as early as 1550, when Straparola's 'Piacevoli Notti' appeared in Venice. This work was translated into French by Jean Louveau (Part I., 1560) and Larivey (Parts I., II., 1573), and passed through twelve editions at least before the appearance of Perrault's tales. Straparola's stories, in spite of this apparent popularity, do not seem to have had any influence in France, or to have called forth any imitations. Two of Perrault's tales, 'Peau d'Âne' and 'Le Chat Botté,' have counterparts in Straparola, but cannot be said to have been borrowed from him. Still less influence was exerted in France by Basile's 'Pentamerone' (Naples, 1637), an incomparable collection of popular tales, but written in a difficult dialect, and in a style which seems almost like a burlesque of Marino's. It is worth noting that Mlle. L'Héritier's 'L'Adroite Princesse' (printed in 1696, a year before the first edition of Perrault's tales), has a parallel in Basile.

It is certainly curious, in view of the great popularity of the Italian collections above men-

tioned and the translation of one of them into French, that it was not until 1696 that a fairy tale appeared in print in France, or rather at The Hague, where in a magazine (*Recueil de pièces curieuses et nouvelles tant en prose qu'en vers*) published by Moëtjens were printed (1696-1697), without the author's name, eight fairy tales in prose, which have become part of the world's literature, and in one country at least (England) have entirely dispossessed the national versions. These tales we know as "The Sleeping Beauty," "Red Riding Hood," "Blue-Beard," "Puss in Boots," "The Fairy," "Cinderella," "Riquet of the Tuft," and "Hop o' My Thumb." They appeared together for the first time in 1697 under the title, 'Histoires ou contes du Temps passé, avec des moralitez.' The preface, or dedication to Mademoiselle, is signed by P. Darmancour, Perrault's son, and his name alone is mentioned in the *privilège*. This is the edition which Mr. Lang has reproduced, with all its peculiarities of spelling and printing (absence of paragraphs except for the *moralitez*, etc.).

How old P. Darmancour was when these tales appeared is not known (some say ten, others nineteen), nor is his share in their authorship clear. It is, however, likely that he wrote them out, by way of exercise, as he heard them from his nurse, or from old women on his father's estates, and that afterwards his father corrected and retouched them. This alone can explain that peculiar character of the work which makes it, as Paul de St. Victor says: "Livre unique entre tous les livres, mêlé de la sagesse du vieillard et de la candeur de l'enfant!" Perrault's stories were received with the greatest favor, and called forth an extensive literature of fairy tales in France, lacking, however, the naïveté of Perrault's, and having comparatively little worth, either traditional or literary. Then the fairy tale dropped out of sight in literature and was relegated to the nursery, until in our own times it became, by the curious development of modern science, a subject of serious investigation.

Mr. Lang, in his charming introduction, traces all this strange history with a deft hand, and endeavors to explain, by the light of modern science, the interesting questions connected with folk-tales, their origin and diffusion. As is well known, he rejects the theories by which folk-tales are made a part of Aryan mythology and diffused by the dispersion of the Aryan peoples, or are declared to be of Indian origin and introduced into Europe within historic times chiefly by means of written literature. The theory he advanced is substantially the same as that applied by him to mythology in general, and recently noticed in these columns. The material of fairy tales he accounts for as survivals from savagery, when a belief in speaking animals, magical powers, etc., was universal. Many of the detached ideas and incidents may also be connected with savage customs still existing. The difficulty which he finds insoluble by his or any other theory, is the coincidence in *plot*.

Mr. Lang intends his edition of Perrault as an introduction to the study of popular tales in general, and his elaborate notes to each story show his method of applying his theory to folk-tales. The second work at the head of this article is an excuse for a still more detailed application of the same theory to a single tale. With the present revival of interest in all that concerns the daily life of the Greeks and Romans, which reminds one of the similar enthusiasm of the early Renaissance, we wonder what their entertaining literature was, and what stories and songs amused and lulled to sleep the future victors of Marathon and Zama. We shall probably never know, for while references are frequently made to the fact that mothers and nurses told their children tales, these stories have long ago disappeared, and although we might, according to modern theories, reconstruct some from our own nursery tales, still the truth remains that, besides some fragmentary versions in the work of a fourteenth-century ecclesiastic, we possess no fairy tale in a literary version older than the collection of Straparola mentioned above, with the exception of one remarkable Latin tale. In the second century Apuleius, an African writer, composed his 'Twelve Books of Metamorphoses, or concerning the Golden Ass,' in the fourth, fifth, and sixth books of which occurs the episode of Cupid and Psyche.

With the outlines of the story, which are reproduced in a host of modern nursery tales, our readers are familiar. A wife is not permitted to behold her husband's face; she violates the prohibition and he disappears. The wife then begins a long and arduous search for him, and finally, after the accomplishment of difficult tasks, they are united. For centuries the story was supposed to be a Platonic allegory of the progress of the Human Soul to perfection, but Perrault, in his preface to 'Griselidis' (1695), recognized its true character when he declared: "La fable de Psyché, écrite par Lucien et par Apulée, est une fiction toute pure et un conte de vieille, comme celui de Peau d'Âne." As Mr. Lang remarks: "Nothing in it but the names of the hero and heroine and of the gods connects the legend in Apuleius with the higher mythology of the Olympian consistory." The character of the fable as a popular tale being established, Mr. Lang's purpose is

> "to trace the various forms and fortunes of the popular tales which, among various Aryan and non-Aryan peoples, correspond more or less closely to the fable of 'Cupid and Psyche.' The general conclusions which we shall try to establish are: first, that the essential features of the tale are not peculiar to Aryan peoples only, but that they are found in stories from all quarters; secondly, we shall try to show that these essential features might occur to the human fancy anywhere—granted certain rules and forms of society."

These certain rules and forms, it is needless to say, are savage customs, and it is their application to the solution of the question of folk-tales which constitutes the novelty and value of Mr. Lang's theory. We can only briefly allude to its application to this particular story. Of the various episodes in it, three (jealousy of sisters, and of mothers-in-law, and the crime of curiosity) "are ordinary human notions which may occur anywhere, and anywhere may offer *motifs* for fiction." Two other incidents, sending a foe on dangerous tasks and visiting Hell, are found generally in certain conditions of society and among men with pre-Christian ideas of the state of the dead. "Of the two remaining ideas neither is natural to civilized men in modern society, but both are familiar to many widely scattered peoples in various degrees of culture." These ideas are: that animals can powerfully or magically assist their friends, and the injunction imposed upon the bride not to behold her husband's face and form. The first idea Mr. Lang illustrates very copiously by savage tales from all lands; the second is nothing less than the tabu imposed by many savage races on the freedom of married intercourse. We can do little more here than indicate Mr. Lang's theory, which nowhere is more elaborately developed or more copiously illustrated from the author's great store of savage lore. It is enough to say that the anthropological theory, as we may call Mr. Lang's, invests the study of popular tales with a new interest, and widens immensely a field hitherto restricted to the Aryan peoples.

We have left ourselves but scant space to speak of the books themselves. It would be superfluous to dwell on Perrault's charming style, which finds an appropriate envelope in the most beautiful book ever issued by the Clarendon Press, the first *édition de luxe*, we believe, of that famous establishment. The paper, print, and illustrations (two portraits of Perrault, one of them by Eisen) compare favorably with the product of the most famous French printers, and the binding, half parchment, is neat and appropriate. The 'Cupid and Psyche' is also a beautiful book, with two etchings and a headpiece. We believe it is already out of print, having been limited to 500 copies. Of the English translator, William Adlington, almost nothing is known except that he was an Oxford man, and flourished about the middle of the sixteenth century (the first edition of his work is 1566). His version possesses the quaint charm we admire in the early English translations, inaccurate as many are, and made not directly, but through an intermediate French or Spanish or Italian version.

The Life of Mrs. Godolphin. By John Evelyn of Wooton, Esq. New edition. Edited by Edward William Harcourt. Anson D. F. Randolph & Co. 1888.

THIS pious biography was published some forty years ago from Evelyn's manuscript, and is now reprinted with some few additional notes. It is an episode of life at the court of Charles II. and is most interesting, since it shows how a religious life of a pure and devout kind could be lived by a young girl even in that polluted atmosphere. The heroine was maid of honor at the age of twelve to the Duchess of York for two years, and then on the death of the Duchess went to Whitehall, where she attended the court for seven years; then she retired to Lady Berkeley's, and not very long after married Godolphin. She had made her choice at the first, apparently when fourteen, and the affection of the lovers lasted nine years before they were united. She was very religious, and it was not without overcoming the feeling that she ought to live in retirement, unmarried, and in the usual pursuits of a quasi-cloistral life, meditation and charity, that she at last consented to yield to her love and her lover. She had made Evelyn her sworn friend after a pleasing fashion, and he tried to persuade her to marriage, which he thought was necessary to her happiness. The narrative of the conflict between her religious and her human passion is the most charming and ingenuous passage of the biography, because of its touches of human nature. She was thoroughly in love, and at the same time she was most minded to serve heaven.

At court she was one of the ornaments of the society, witty and companionable, beautiful, diverting, and a favorite. She did not allow her devotions to interfere with the gayety of others. She joined in the games, and even after withdrawing from the court in order to live privately and with more time for religious exercises, she was commanded to take a leading part in a masque, in which she played the goddess Diana, and was splendid with jewels and robes. On that occasion she lost a diamond of the Duchess of Suffolk's, but the Duke of York made it good. She owed something of favor to her being the child of Col. Blagge, one of the most trusted loyalists of both Charles I. and Charles II.; but she held a place also on her own account in the esteem

of the court. She played cards and gave her winnings to the poor; but once when she lost she made up her mind not to play any more. The resolution—she was in the habit of writing down her resolves, confessing herself to her diary, and so on—is characteristic:

"I will never play this halfe year butt att 3 penny-ombre, and then with one att halves. I will not I doe not vow, but I will not doe it—what, loose mony att Cards, yett not give [to] the poore! 'Tis robbing God, misspending my tyme, and missimploying my Talent: three great Sinns. Three pounds would have kept three people from starveing a month: well, I will not play."

She was very good to the poor, visiting them, feeding and clothing them. She was also somewhat inclined to ascetic habits, eating but one or two dishes at meals, fasting, and in general mortifying herself in gentle ways, but much to her injury, Evelyn thought; and he was not satisfied with her replying to him, "I could get fat in three days." She went once to Paris in the train of the Ambassador, but successfully avoided the gayety of the place so far as was at all possible, even to the point of not permitting the French King, who had heard of her wit and beauty, to see her. It was on setting out on this journey that she deceived Evelyn. She had been married privately, and on his commiserating her for having to leave her lover, she said: "Mr. E., if ever I returne againe and do not marry, I will still retire"—meaning into a private and religious life. This, says Evelyn, "was the only tyme that in her Life she ever prevaricated with me, and cover'd it with that address, and was, I am most assured, in deepest sorrow; as all my former suspicions of her being marryed vanish't." On her return the marriage was announced, and she lived happily with her husband some two years, and then died in childbed at the age of twenty-five. The eulogy which Evelyn then pronounces over her is very great, but evidently wholly sincere. The instances he gives of her ways and deeds and temperament are delightful illustrations of humble piety; and certainly if she seems at times like a Catholic gone astray into another fold, her life may well be reckoned in the calendar of Protestant saints. The biography is a lasting part of religious literature.

Tertium Quid: Chapters on Various Disputed Questions. By Edmund Gurney. 2 vols. London: Kegan Paul, Trench & Co. 1887.

Mr. Gurney is already well known as the author of two more substantial works, the 'Power of Sound,' a treatise on musical æsthetics, and 'Phantasms of the Living,' a laborious piece of "psychical research." He has also written important papers on hypnotism. The essays contained in these volumes are revised reprints of articles which have appeared in reviews; and the title 'Tertium Quid' hints at the fact that many of them seek to mediate, by new points of view, in certain old disputes.

The essays in the first volume are philosophic, those in the second are æsthetic—and the style goes with the subject. Mr. Gurney's philosophic style is too complex to be easy reading. His style when he writes on music is direct, and often enchanting. These musical essays remind us of some of the most admirable pages of the 'Power of Sound'—on the whole, if we mistake not, the best work on æsthetics ever published, but of which the misfortune is that it is too psychological for the musicians, too musical for the psychologists, and too bulky for the generality of mankind.

But to begin with the philosophic essays. The first three of them, under cover of reviewing Messrs. Harrison's, Seeley's, and Mallock's respective deliverances, treat of the possibility of a religious conception of life. The next two handle the Vivisection controversy; the sixth is on "Evidence in Matters Extraordinary"; the seventh is an attempt to show that utilitarian principles furnish rational ground for altruistic obligation; and the last (entitled "Monism") sets forth very completely the perplexities to which the theory of "mind-stuff" atoms leads. It is no easy matter to give an account of these essays in brief, their manner is so much more tentative than dogmatic, and their thought so subtle and thorough, so observant of possible objection, so full of saving clauses, and careful to avoid excess. The fact is, Mr. Gurney loves truth almost too much—too much, that is, to be a popular writer on topics where the truth lies buried deep. Not the cutting, but the untying of knots, is his aim. But where the knot is intricate, the operations of the faithful untyer often outlast the patience of the looker-on; and such, we fear, may be the effect of Mr. Gurney's philosophizing upon the common reader, who wants nothing so much as to get quickly to some serviceable final phrase.

To all who care for truth, however, more than for any stop-gap phrase, we can heartily recommend the first of these volumes. Rarely does one meet a writer whose intellect is played on from so many sides, or who so continuously takes the wider view. Refusing to ignore the religious problem, the quest of a conception of life which shall give inward peace, he equally refuses to find peace in any such *abstractions* as Professor Seeley's worship of Natural Law, or the Comtist "religion of Humanity," for these only banish perplexity by taking so distant a view that discordant individual destinies disappear from sight. The individual destinies lie heavy on Mr. Gurney's soul, and positive peace he finds none within the lines in which the bookkeeping of "Science" with Nature has hitherto been carried on. That these lines are prematurely drawn, and that the account is probably not yet closed, is a truth on which Mr. Gurney well insists; and his final conclusion would seem to be, that *if there be* an invisible order continuous with the present order of Nature and enveloping it, our attempts at solving the religious problem rationally may be postponed till the facts of the invisible order are known. Empty as is such an hypothetical supernaturalism (if such it can be called) of positive content, skeptical as is its intellectual form, our author is careful to point out its enormous importance from the practical point of view. Whereas the keynote of dogmatic Naturalism can only be Resignation, the keynote of any possible supernaturalism may be Hope:

"I simply state as a psychological fact, that the sense of possibilities that can never be disproved is capable of exercising a pervading effect on the human mind which is absolutely irrelevant to any numerical estimate of odds. . . . To the majority, the amount of solace which the idea of a chance will give is out of all proportion to the greatness of the chance. Suppose that, after condemnation to a long term of captivity, a prisoner is told that there is one chance in ten of his release at the end of a year; the large majority of men, in such a case, would find the burden of the year immensely lightened. Nor, I believe, would the effect be diminished, but rather enhanced, if the chance were indefinite and not susceptible of a numerical statement."

This is interestingly applied to the question of immortality on pages 143–150 of volume i. If it seem to the reader nothing short of a wholesale licensing of credulity and granting of passports to the paradise of fools, let him read the book. He will see that Mr. Gurney's intellectual fibre is at the furthest imaginable extreme from credulity. Balanced states of mind like his are growing commoner; but between the coarse self-assertion of the upper and the lower dogmatisms, their fate is still, as a rule, to be pushed to the wall.

Of the æsthetic essays we have left ourselves no room to speak. They are altogether admirable. Most writers on the philosophy of the arts seem to have been specially bereft by nature of artistic perception—probably to enable them the more fluently to write. But Mr. Gurney can perceive and describe as well as reflect. His vindication of the non-reasonable, magical, or purely physiological character of the charm of poetry is as fresh and profound a piece of criticism as we have read in many a long day. Altogether, these volumes can rank among the subtlest and sincerest pieces of critical work of our time.

On Conducting: A Treatise on Style in the Execution of Classical Music. By Richard Wagner. Translated by Edward Dannreuther. London: William Reeves. 1887.

It is not often that a reviewer can say of a translation that it is as good as the original, but this is true of Mr. Dannreuther's version of Wagner's essay on conducting; indeed, some passages are easier to read than in the original. Wagner's literary style is often as clear and as direct as Heine's, but at other times it is as involved as Jean Paul's. Mr. Dannreuther has taken pains to simplify the more difficult sentences, and his knowledge of German and English is so thorough that he has always been able to find a happy equivalent even for the unusual or new words which Wagner never hesitates to use if they give a sort of onomatopoetic realism and vigor to his speech. The essay itself should have been translated into English long ago, for it is one of the most valuable contributions ever made to musical literature—an essay which every musician, whether a conductor, a player, a singer, or merely an amateur, should carefully read and reread. It throws a flood of light on the questions of interpretation and expression.

Pedants who cannot read between the lines of a composition are constantly clamoring for "correct" readings of classical compositions, and insisting that we have no right to play them in accordance with modern notions of expression. Now, Wagner's notions as to what is "correct" in the interpretation of classical works differ widely from those universally current twenty years ago. He not only protests against the misinterpretations of his own works ("I am sorry to say I know of no one to whom I would confidently intrust a single tempo in one of my operas; certainly, to no member of the staff of our army of time-beaters"), but goes so far in his indictment of these conductors as to assert that whatever popularity Beethoven's "Eroica," for instance, had, was really due to the fact "that Beethoven's music is studied apart from the concert-rooms—particularly at the piano—and its irresistible power is thus fully felt, though in rather a roundabout way."

Conductors chiefly fail in their imperfect sense of tempo. "The whole duty of a conductor is comprised in his ability always to indicate the right tempo." Now, "the right comprehension of the *melos* is the sole guide to the right tempo," and "our conductors so frequently fail to find the true tempo because they are ignorant of singing," and do not sufficiently fix the attention of the orchestra on the melody of the work. They take a certain time for a movement, and play it through with metronomic regularity, regardless of the fact

that there may occur some bars of pathetic melody which have the character of a slower movement, and, therefore, ought to be played slower. The fact that such modifications are not marked in the scores is no proof that they were not made by the composers when they conducted. It was not customary to mark them formerly; but all testimony points to the fact that the great composers (especially Beethoven) used a varied tempo, or rubato, in conducting. "It is essential . . . that the tempo shall be imbued with life as delicate as the life of the thematic tissue. We may consider it established that in classical music written in the later style, *modification* of tempo is a *sine qua non*."

Many interesting cases are given, illustrating this principle in detail, and the proof of their correctness lies in the magic effect which they always produce. The greatest Beethoven conductors in Europe are Von Bülow and Hans Richter, both of whom apply Wagner's principles. And as for Wagner himself, he relates that eighteen years after Weber's death he conducted "Der Freischütz" at Dresden, when he

"ventured to set aside the slovenly manner of execution which had prevailed under Reissiger, my senior colleague. I simply took the tempo of the introduction to the overture as I felt it; whereupon a veteran member of the orchestra, the old violoncellist Dotzauer, turned towards me and said seriously: 'Yes, this is the way Weber himself took it; I now hear it again correctly for the first time.' Weber's widow, who still resided at Dresden, became touchingly solicitous for my welfare in the position of Capellmeister. She trusted that my sympathy with her deceased husband's music would bring about correct performances of his works, for which she had no longer dared to hope. The recollection of this flattering testimony has often cheered and encouraged me."

Wagner needed something to encourage him, in view of the treatment to which his own works were subjected by these conductors. He relates how at one theatre *Tannhäuser* was obliged to relate his tragic recollections of Rome in waltz time; how "Rheingold," which should last two and a half hours, was dragged out to three, and the "Tannhäuser" overture took up twenty minutes instead of twelve, etc. When Wagner conducted the "Meistersinger" overture for the first time at Leipzig, the audience insisted on a repetition. Subsequently it was played by the same orchestra, but conducted by Reinecke, and was hissed! When the conductors added malice to their ignorance, the result was still more disastrous. Mr. Otto Floersheim relates how Ferdinand Hiller, after much pressure had been brought to bear upon him, conducted the "Meistersinger" overture at a concert in Cologne. But not only did he have no conception of the changes of tempo; he deferred the rehearsal of the overture to the last moment, and had only time to play it through *once* before the concert. Now, this overture is one of the most difficult pieces in existence, and the best orchestra in the world could not do justice to it without three or four rehearsals. The inevitable result at Cologne was that the orchestra got "all mixed up," and produced such a wild chaos of polyphonic cacophony that the critics next day naturally wondered "what in the world could have induced Dr. Hiller to put such a piece on his programme"! Dr. Hiller did not even like the "Tannhäuser" overture until he heard it as conducted by Herr Seidl, when he was honest enough to admit: "Ja, so gefällt sie mir auch."

Universal History: Ancient History, by George Rawlinson, M.A., Oxford.—Mediæval History, by George Thomas Stokes, D.D., University of Dublin.—Modern History, by Arthur St. George Patton, B.A., University of Dublin.—Geological History, by Edward Hull, M.A., LL.D., F.R.S., Director of the Geological Survey of Ireland. Philadelphia: J. B. Lippincott Co. 1887.

THOSE who are acquainted with Professor Rawlinson's 'Manual of Ancient History' will get a good notion of this 'Universal History,' of which he is one of the editors, by being told that it is upon the same general plan as that useful book. That is, it consists of a number of parallel national histories, the object being as great completeness as possible within the rather narrow limits. Each considerable nation has a chapter, and in each chapter nearly every king receives mention. As there are abundant chronological and genealogical tables, this completeness makes a book very convenient for reference, but not adapted for consecutive reading. In mediæval and modern history we have besides a division into periods, so that the history of England, for example, must be sought in ten different places, three in the mediæval and seven in the modern volume. If this number of periods appears excessive for the time since 1453, it is perhaps inadequate for the time before that date.

Professor Rawlinson's 'Manual' is so well and favorably known that it is not necessary to speak in detail of his share, which is to all intents and purposes an adaptation of the earlier work. The special characteristic of Dr. Stokes's work is a praiseworthy effort to give his chapters a degree of variety and interest which the general plan of the series makes rather difficult. Hence, no doubt, the small number of periods, allowing to each period a greater fulness and consecutiveness. Hence, also, the judicious emphasis and expansion in the account, for example, of Charlemagne, and the introduction of details of special interest, like the mention (p. 54) of "the oldest architectural plan in the world," at St. Gall. Such details can be introduced only by the omission of irrelevant matter, and here the work is less satisfactorily done. For example, it is not stated (p. 50) that Pippin the Short made himself king; Dagobert I., the most important king between Clovis and Pippin, is only mentioned incidentally, while half a page is given (p. 48) to the wholly unimportant Dagobert II.—apparently because there is an interesting bit of literary history in connection with him, standing in especial relation to Ireland.

Mr. Patton's part of the work ('Modern History') suffers from the excessive number of divisions; yet is done very well in detail. In the chapter on the United States the Whig party is regularly called "Republican," *e. g.*, "In 1841 the Republicans were returned to power by an overwhelming majority." Although the *Caroline* affair made a good deal of noise at the time, it is certainly an exaggeration (and a damaging one) to say that Van Buren "destroyed his popularity by the firmness with which he repressed those who in the Northern States wished to help a rebellion in Canada" (p. 510). On page 508 Indiana is not mentioned among the States admitted to the Union. On page 511 is a curious mixture of dates—that Texas was annexed in 1845, "and Iowa also in 1846" (!), both being admitted to the Union when Polk became President, in "1849"; on the following page Taylor is said to have become President in 1849. One of the most useful features of the entire work is the table, prefixed to this volume, of "the populations, religions, and governments of the world, with the colonies and dependencies of the European and other States." Here we find a complete list of these colonies, with the population and date of acquisition of each.

Prof. Hull's volume aims to give "an outline of the Geological events through which our Globe has passed since it assumed its form and became the abode of animals and plants." No such "summary of the Historical portion of the Science has hitherto," he says, "appeared in this country [England]." As a book designed especially for historical students, it will be heartily welcomed.

Chauvenet's Treatise on Elementary Geometry. Revised and abridged by William Byerly, Professor of Mathematics at Harvard University. Philadelphia: J. B. Lippincott Co.

PROF. CHAUVENET was one of the most accomplished mathematicians in America, and the text-books which he published came rapidly into extensive use. But his own knowledge was so wide and so deep, and he had such an overmastering desire to treat everything in an exhaustive manner, that his text-books often contained much which, however interesting and necessary it might be to those who intended to make the teaching of mathematics their business, or to follow a profession (like astronomy or engineering) that requires the constant application of mathematics, the average teacher and pupil would be compelled to pass over from mere want of time. Prof. Byerly's abridgment is a handsome octavo of 322 pages, and is quite large enough. Nothing really essential in the original treatise is omitted. The student who has mastered the book will be well prepared to enter upon the study of the higher branches of mathematics, and this will be the wisest course for him to pursue. Auguste Comte considered Clairaut's 'Éléments de Géométrie' as constituting a sufficient preparation for higher studies, and that work is a small 12mo of 128 pages.

The study of geometry, as usually pursued, is a mere exercise of memory; the student learns the statements and formal demonstrations of a certain number of propositions, and there the matter ends. Give him a new proposition not contained in his text-book, and, even though it may be a direct consequence of one he has learned, he is yet often perfectly helpless. He may have learned much, but can do nothing at all. To prevent this result, and to compel the student to do something "on his own hook," is one of the chief objects of Prof. Byerly's revision, and hence arises one of the chief differences between it and the original work. In the latter, the "exercises" were all placed in a mass at the end of the work, where as a rule they were left undisturbed by teachers or pupils. Prof. Byerly has added many new ones, and, while giving a considerable number at the end of each book, he has placed most of them in direct connection with the theorems they serve to illustrate or most nearly resemble in substance or in form of demonstration, and in such a position that the student will necessarily regard them as part and parcel of his lesson and of the science he is studying. For these "exercises," as they are called, are themselves theorems often quite as general and always to be proved in the same manner as the ordinary theorems of geometry. One of Prof. Byerly's methods of abridgment has been the omission of the Introduction to Modern Geometry, which formed a long appendix to the original work. There was probably here and there a professor or teacher of mathematical tastes who looked it over as matter of curiosity; otherwise it merely added to the bulk and cost of the book for no practical end.

On the whole, Prof. Byerly's omissions, al-

terations, and additions appear to have been judiciously made, and for all the purposes of instruction in elementary geometry as usually pursued in our high schools and colleges it may well take the place of the original work, while it presents many improvements, some of which we have endeavored to point out.

Die Welt, in ihren Spiegelungen unter dem Wandel des Völkergedankens. Prolegomena zu einer Gedankenstatistik. Von Adolf Bastian. Berlin: Ernst Siegfried Mittler & Sohn. 1887. Hierzu ein Atlas: Ethnologisches Bilderbuch, 24 Tafeln, nebst Erklärung.

BASTIAN'S 'Bilderbuch' has a preface which mentions the 'Prolegomena' as one "in which the ensuing representations receive their explanation in their further relations"; and the 'Prolegomena' bears an annotation on the back of the title stating that "to bring the kaleidoscopic pictures of the following pages nearer to a more intelligible intuition, the author has issued, simultaneously, and through the same publishers, an Atlas in twenty-four plates, under the title of 'Ethnological Picture Book,' with explanatory reading matter." These are respectively the only references between the covers of the two works to each other.

'The World, in its Reflections under the Mutations of the National Idea,' after a table of contents embracing 469 numbered titles, such as: "(1) Psychology, (2) The Cryptogamina of the Human Race, (3) The Beginning, . . . (467) Circle of Sensualism, (468) Subjectivity, (469) Collection of Materials," contains an introduction covering twenty-eight pages, succeeded by wholly unbroken reading-matter of 469 pages, probably (but not apparently) agreeing with the table of contents, and varied in two sizes of type upon no visible basis of differentiation. Such is what may be called the perceptible exterior of this wonderful work, of which not a single sentence is properly comprehensible without recourse to some other book (never referred to by title and page) in which a portion of the phraseology may have been found. The 469 titles together express a sort of cosmogony, ostensibly compiled from the cosmogonies of the various nations and peoples, with a certain prominence given to the "cryptogamina of the human race," *i. e.*, the Hottentots, Diggers, and Negroes. At least 300 pages, however, are taken up with extracts from and discussions of sayings of Kant, Darwin, Du Bois-Reymond, Fichte, Schelling, Newton, and hundreds of other lights of science.

Psychology, as we laboriously and dubiously gather, is the sum of all the sciences. In explaining the workings of the human soul, it explains that which the soul recognizes and asserts. An extraordinary advance has been made in psychology within some very recent period, which is frequently hinted at, but not once specified. The advance consists, as nearly as can be guessed, in the substitution, for a method which "required of everything scientifically considered a definite purpose—'sought the purpose as the thought at the bottom of things' (see Trendelenburg)," one which recognizes "necessarily working powers, blind, so long as not seen through; accidental, so long as not constituted by law." "Under this grand accession, for many years, masses of new material have been heaping themselves up, out of the ethnical popular views of distant lands, agglomerated, as it seemed, into a wild ball of confusion, spurning the idea of disentanglement, and seeming scarcely to reward the pains of serious consideration, because only cheap goods in tawdry garments [of Indian finery and negro shoddy]."

The fact that these ethnological perceptions are raw materials for the crucible of the science of psychology is at the bottom of the author's scientific theory, but is only implied, not expressed. He seems to think that many people can think better than a few; that this association of thinking is done in the guise of nationalities, and, of course, in the forms of language; and that, therefore, the notions of nations, though never so low in intelligence, on subjects of the most abstruse thought, must be received as teachings by the thinkers of the present time. His book discloses the failure of its own theory, for while it displays the phantasmagoria of the Mandans, Buddhists, and Maoris, it relies upon the thoughts of Kant and Darwin.

On the whole, we must rank this work among the oddest and most unreadable and unintelligible of the many such which Bastian has produced of late years.

The Early Life of Samuel Rogers. By P. W. Clayden. Boston: Roberts Bros. 1888.

THE life of Rogers is not one that easily lends itself to entertaining biography. His memory is rather in the memoirs of the time. His poems were less immortal than his breakfasts, and the incidents of his personal life fall even nearer to the "dead-line" of time than his poems. He was the son of a banker, showed some signs of literary ability, and in his early manhood betook himself to the muses after the counting-room was shut for the day. In an age when his competitors were the Della Cruscans, when Cowper was the only poet and his mind was clouded, it was no great distinction to win the laurel for an hour. But Rogers made good use of his opportunity; he was wise enough to cease to imitate Gray, and to decline on the less exacting model of Goldsmith, and he sold over 20,000 copies of his principal work. Almost fifty years afterwards he was still of repute enough to decline the Laureateship which Tennyson accepted. His name, however, is inscribed rather in the social than the poetic annals of literature, and his true biography lies in reminiscences.

A life of over ninety years, however, should yield materials to the makers of books, and it is not surprising that this first volume, which is not a small one, should bring his career down only to his fortieth year, when he first set up his bachelor-box as a man of elegant tastes, not only in literature, but also in art. He was fortunately placed in life, succeeding to £5,000 a year and a younger brother who was willing and able to carry on the business, and leave the poet in the enjoyment of the profits. He kept and left diaries, and of course there are many letters. But one does not find in all this material much that is of interest. He was a man who took journeys; and one to Edinburgh, where Adam Smith entertained him, and two to Paris, before the Terror and after the advent of the First Consul, are the most entertaining portions of this volume. Some glimpses of the Whigs of the Revolution, among whom was his father, and of the society of the famous Doctors Priestley and Price, make pleasant episodes. Taken altogether, however, the narrative is dreary, and appeals only to those whose boundless literary curiosity will not suffer them to tire of the details of even the least noteworthy period of English letters. It is possible that the second volume may contain more that is of real interest, but the present one presents a limited and not very edifying phase of English life in the end of the last century.

Life of Thomas Hopkins Gallaudet, Founder of Deaf-Mute Instruction in America. By his son, Edward Miner Gallaudet. 8vo, pp. iv, 339. Henry Holt & Co.

THE present memorial appears on the one hundredth anniversary of Gallaudet's birth; and in its earlier pages it carries us back to the time of Dr. Thomas Chalmers and of Hannah More, both of whom wrote encouraging letters to the young enthusiast in 1817–1818. An especially interesting glimpse of that time is conveyed in a letter from Zachary Macaulay, the historian's father, acknowledging young Gallaudet's "luminous account" of the French method of instructing the deaf and dumb, a method of which Gallaudet was already the recognized expounder, and of its superiority over the English. Mr. Macaulay writes as follows:

"I should have been glad to see the specimen of American typography which you have sent me, but it was conveyed to me through the Post-office, with a charge of £4 5s. on the cover. I have hesitated to pay this, and the packet is still unopened. I have had of late many such parcels addressed to me from America, which I have been obliged to decline receiving on account of the enormous expense attending them. I thank you for your kind inquiries respecting my son, Thomas Babington. He is now in good health, and prosecuting his studies with ardor at the University of Cambridge. God has been pleased to endow him with very considerable powers of mind, and with a very strong desire for knowledge. My prayer—and indeed, I am thankful to say, my hope—is that they may be sanctified and made subservient to His glory."

We will not undertake to recount the story of Gallaudet's life, especially as this is not the first biography that has appeared of this remarkable man. His tour in France and England, his faithful study of the deaf-mute problem, the establishment of the famous school at Hartford, his marriage to one of the pupils of that school, his resignation from the school after seventeen years of devotion to it, and his subsequent connection for a similar length of time with a hospital for the insane—all this is told in this pleasant volume with dignity and a certain charm. The portrait prefixed to the book is new, and gives a vivid impression of the kindliness and urbanity of the man.

BOOKS OF THE WEEK.

Archer-Hind, R. D. The Timæus of Plato. Macmillan & Co. $4.
Bates, Josephine W. A Blind Lead: The Story of a Mine. Philadelphia: J. B. Lippincott Co. $1.25.

Fine Arts.

SOCIETY OF AMERICAN ARTISTS.—I.

THE tenth exhibition of the Society of American Artists, now open at the Yandell Gallery, contains only 137 works, but it is of such marked excellence, it is so entirely free from cheap work of any kind, it is so complete in its general aspect, and certain pictures are of such surpassing merit, that it is safe to say that no better exhibition of American art has ever been seen in New York. If it be thought necessary to make comparisons with other exhibitions of the Society, it may be said on various accounts that this one is the best in its history. One reason is, that the display is more representative of the actual status of American art than ever before, as it includes more than the usual number of works by painters who are not regular contributors to these exhibitions. Another reason is, that the Society has recently added to itself some twenty new members chosen from among the strongest of the young painters who have come to New York in the last five years, and these new members seem to have made it a point to send their most important work of the year to the Society exhibition. And yet another reason is, that the older members, realizing the possible effect of the competition of this new and vigorous element, have likewise put their best foot forward, and sent to the exhibition, not some slight work depending for recognition on its merits as a clever piece of artistic dash, or some other work whose chief characteristic lay in its experimental side, but of their very best. This regeneration of the Society really began in 1886, when an excellent exhibition was made in the galleries of the Metropolitan Museum, which, however, obtained only a *succès d'estime*, owing principally to its isolated location and the consequent lack of interest in it on the part of the general public. It was still more apparent last year, when the exhibition was held for the first time at the Yandell Gallery, and its completeness and general excellence were universally acknowledged. Far from losing its excuse for being with the advent of a more liberal policy at the Academy this year, the utility of the Society exhibition is more apparent than ever. The number of reputable painters in New York is rapidly increasing, and the need of a place to exhibit becomes more and more pressing. The Academy, with the space it has at its disposal, for one thing, does not suffice, and in addition to that, by the conditions necessarily existing, it cannot pretend to make the merit of a work offered for exhibition the sole qualification for admission. The Society of American Artists, with no traditions to hamper it, can and does do this, and its exhibition this year affords the most convincing proof that its aims are appreciated by the body of artists at large.

Mr. Abbott H. Thayer is one of those painters who are comparatively rare exhibitors, and if anything from his brush is to be publicly seen in the course of the year, it is at the Society's exhibition we must look for it. His single contribution in the present exhibition, "An Angel," No. 111, has been honored with a place in the centre of one of the end walls of the gallery. It is a picture of a young girl whose head appears between the large white wings which rise above the shoulders and frame in the figure on either side. It is not characterized by any intentional idealization of face with a religious motive, just as it is not treated, either, as a piece of realistic figure painting with a conventional addition of wings. The handiwork has been made as unobtrusive as possible by the artist, and he has been remarkably successful in subordinating technique to expression. The face is that of such a child as might be seen almost anywhere; it is distinguished by neither the traits of high birth nor those of the people; it is rather regular in features, of every-day mould, and intensely human. There is no lengthening of lines and accenting of curves *à la* Botticelli, and no attenuation nor attempt at the look of asceticism *à la* Fra Angelico; the painter has secured the charm that lies in this gentle countenance by simpler means. He has drawn tenderly and delicately a wistful little face and painted it quietly and understandingly. He has placed white wings and a white gown in graceful lines about his figure, and he has conceived and executed the whole in the spirit of an artist. The result is a delightful work entirely worthy of his reputation, such a work as artists and laymen unite in acclaiming, and above all a piece of pure and individual art.

Mr. Kenyon Cox is another painter who has ever been distinguished in his work by an aim to produce something for the sake of art, and who is known as the creator of many fine compositions both in the fields of pictorial and illustrative art. His picture of "Jacob and the Angel," No. 30 in the present exhibition, is the most complete work of the kind he has shown. Purely as a piece of drawing and modelling this muscular figure of Jacob straining in his struggle with the impassive angel, who stands erect and unmoved in the consciousness of his supernatural force, is an accomplished effort, but there is greater merit in the excellent ensemble of the picture. The pose of the figure of Jacob, with his twisted limbs and bended back, is well contrasted with the dignity of line in the figure of the white-robed angel, and the group is effectively composed. The silence and the isolation of the scene are admirably suggested by the shadowy landscape, with its dark shadows thrown on the foreground by the overhanging branches of the tree, and the barren expanse of the moonlit hills beyond; and the brownish tone of the bare back of the figure of Jacob, thrown into prominence as a mass by the light falling upon it, concentrates the interest in the principal figure. Possibly, had the painter chosen to represent the scene in another effect than that of the mysterious semi-gloom of moonlight, he might have obtained more quality of color in his picture, to which, as it is, the reproach may be made that it is somewhat monotonous in its general scheme; but what was to be gained in that direction was no doubt wisely sacrificed to give the impression of the intensity of the silent struggle in the dead of the night, with only the stars in their distant spheres to look down upon it. In another picture, "Indian Summer," No 29, in which the nude is treated in realistic fashion, and an autumn landscape is introduced as a background to carry out the sentiment of the figure, Mr. Cox has been less successful. There is excellent painting, especially in the upper half of this massive figure, and the head is of a type which admirably befits the luxuriant character of autumn, which it is meant to personify; but the pose is lacking in grace, and the legs are needlessly heavy and deficient in variety of line. In "Portrait of Augustus St. Gaudens," No. 28, we find Mr. Cox at his very best. The sculptor is shown with the head seen in profile, modelling a relief in clay, with his right arm bared above the wrist. A plaster cast or two, a modelling stand, and an easel are the principal accessories, which are quietly relieved against the whitish-gray walls of the studio. In this picture Mr. Cox has had to deal with an exact problem in the representation of things as they exist in nature, and has had an opportunity to display his technical powers. He has given a brilliant exposition of his talent in this respect, and has, moreover, shown a remarkable skill in the expression of character. This portrait-picture, artistically conceived and as artistically executed, is one of the finest things in the exhibition. Mr. Chase

essays a portrait-picture, also, in the life-size group of a lady in a Japanese gown of black, with an infant in her arms, "Mother and Child," No. 16. The figure of the mother is painted in a harmony of low tones, the head relieved in profile against a sombre background; and the child, seen in full face, looking over her shoulder, counts with its dress of white as an effective note in the composition. In "Portrait of a Gentleman," No. 15, the same general treatment is adopted, and the firmly modelled head appears in luminous relief. The figure, as in the "Mother and Child," is well planted on its feet and has an admirable look of reality. "Hide and Seek," No. 17, a third contribution, is one of those clever artistic fancies which Mr. Chase produces from time to time, and is a picture of peculiar charm. The composition shows the head and shoulders of a little girl with blonde locks, who is peeping out from behind a door at the left-hand corner of the canvas, while another little girl in a white frock appears approaching on tiptoe the opposite corner of the spacious room, where a wide curtain hangs at the entrance to another apartment. Expectant curiosity is delightfully depicted in the attitudes of both the children. Mr. Chase is also represented in the exhibition by a group of three little pictures showing scenes in and about Brooklyn, of which one, "In Tompkins Square," No. 19, is especially admirable for direct artistic methods, and by "A Winding Road," No. 21, a small landscape, in which a motive of the simplest description is made the subject of a charming rendering of the light and atmosphere of out-of-doors.

One of the salient characteristics of the exhibition of last year was the excellence of the display of portraits. This feature is quite as remarkable in the present exhibition, and includes work by most of the ablest portraitists in the country. Mr. Wyatt Eaton is seen at his best in the "Portrait of Man with Violin," No. 49, a finely constructed and soundly painted three-quarter length, most complete in execution and handsome in its subdued tones of color. Mr. Edmund C. Tarbell of Boston, who made a notable début at the exhibition of last year, contributes a portrait of a young lady in a black dress, "Portrait," No. 109, which sustains the reputation his work then obtained, and is a brilliant performance with a thoroughly personal stamp. Mr. Ruger Donoho, one of the strongest of our landscape painters, exhibits a "Portrait of the Artist," No. 43, which is admirable in its simplicity, its reserved but forceful painting, and ranks with the best things in the gallery. Mr. Sargent sends a full-length portrait of a lady, which presents the same quality of modernness that marks his portrait at the Academy, and which, if it is not of the very best work he has done during his stay in this country, is yet a most striking realization of life, and is painted with a fine sense of completeness of ensemble. Mr. Fowler is represented by a "Portrait," No. 60, showing a full-length figure of a boy with a violin, painted with much facility of execution, and notable for concentration of the effect of light and harmony of tones. Mr. Beckwith contributes a portrait of two little girls standing hand in hand, in gray frocks, with a black curtain behind them and other attributes of mourning as accessories, called "The Orphans," No. 3, which should be noticed for its effective painting and realization of character, in spite of the gloomy impression given by the subject motive. Mr. Irving Wiles signs an excellent portrait of a lady in a leopard-skin cloak, "Portrait," No. 136; Mr. Rice another, of a lady in evening costume, "Portrait," No. 97; and Miss Amanda Brewster two, "Portrait," No. 10, and "Portrait," No. 11. Mr. Lowell Dyer exhibits a serious piece of portraiture, a three-quarter length of a lady in a black dress, quietly painted and refined in style, "Portrait," No. 45, and Mr. W. S. Allen sends one of the best heads in the exhibition, admirably brushed, solidly modelled, and possessing marked individuality, in the "Portrait of Col. V. A.," No. 2.

Mr. Weir's contributions are three in number, and include a portrait of a gentleman, "Portrait," No. 131, which is excellent as a study of character, and is both soundly and cleverly painted. His other two pictures are "Still Life," No. 132, and "Still Life," No. 133. The first of these, a study of a Dutch pewter mug and a glass or two, is chiefly remarkable for its quality of light and the impression of reality. The other is a picture of a large brass colander and a pumpkin freshly split open with a large knife stuck in a piece which lies on the table. Vollon, who, like Mr. Weir, is a figure painter of the first rank, has achieved his greatest celebrity among his fellow-painters as well as with the public by the painting of still life. Some of his pictures of this sort have a world-wide reputation. Of Mr. Weir's picture it is not too much to say that it might well be signed by Vollon himself, and indeed were it so signed, it would without question be considered one of his finest works. It is impossible to do more than name this picture, and add that in color and handling it is a most accomplished performance. Its admirable quality can only be appreciated by seeing it. To those who can enjoy a piece of painting for its own sake, we commend this picture, with the assurance that the sight of it will give them the keenest sort of pleasure. Side by side with it in the exhibition is another picture which appeals to the artistically cultivated in much the same way. It is painted by Horatio Walker, and is called "A Pig Sty" (No. 129). Mr. Walker, who has painted cattle, and sheep, and pigs, and whose pictures have been of the best in the exhibitions at the Academy, the Water-Color Society, and elsewhere, has never painted a better picture than this one. It is, like Mr. Weir's "Still Life," an admirable piece of tone, and a most healthful, artistic piece of painting.

Dictionary of National Biography.

Edited by LESLIE STEPHEN.

Volume XV will be issued early in July.

"One of the best edited, as it is one of the most useful and important enterprises of the kind known to our day and generation. . . . One cannot exaggerate the help thus afforded the student of every branch of human activity, and particularly of English literature. . . . We have also pointed out the interest which Americans have in this Diction ary, especially in the case of the founders of the several colonies, but also all along the line down to the present time. . . . These and many others touch our history in various memorable ways. . . . All these articles can be read with the greatest profit, and should be accessible in every library in the land, to say nothing of every gentleman's library, whither this Dictionary should find its way, even if merely in recognition of so laudable and costly an enterprise."—*Nation.*

TWELVE ENGLISH STATESMEN.

A series of short biographies designed to present in historic order the lives and work of those leading actors in English affairs who by their direct influence have left an abiding mark on the policy, the institutions, and the position of Great Britain among States.

In the list of subjects the great movements of national history are made to follow one another in a connected course, and the series is intended to form a continuous narrative of English freedom, order, and power.

The volumes are as follows. Each, in paper, 50 cents; cloth, flexible, 60 cents; cloth, edges uncut, 75 cents.

WILLIAM THE CONQUEROR. By Edward A. Freeman, M.A.

Mr. Freeman has cleared away the tangle of prejudice and evil report that have so long attached to the Conqueror's name, and would restore to him the title of Great, which he bore in his own time. This brilliant and instructive biography ushers in the series most auspiciously.—*Boston Saturday Evening Gazette.*

It is needless to say that the author's lucid and compact style makes the book exceedingly interesting, and that his knowledge of the subject makes it equally convincing. The series to which it belongs could not have been more happily inaugurated.—*Chicago News.*

A little book of which the learning and solidity are beyond dispute. . . . This book has a definiteness of its own because Mr. Freeman has honestly endeavored to set William in his place as the chief among the makers of England. He has given an admirable account of William's training, William's character, and William's work—an account which could not be amended within its own limits.—*Saturday Review.*

HENRY II. By Mrs. J. R. Green.
EDWARD I. By F. York Powell.
HENRY VII. By James Gairdner.
WOLSEY. By Prof. M. Creighton. READY.
ELIZABETH. By the Dean of St. Paul's.
OLIVER CROMWELL. By Frederic Harrison.
WILLIAM III. By H. D. Traill. *May.*
WALPOLE. By John Morley.
CHATHAM. By John Morley.
PITT. By John Morley.
PEEL. By J. R. Thursfield.

FOUR OXFORD LECTURES, 1887. FIFTY YEARS OF EUROPEAN HISTORY—TEUTONIC CONQUEST IN GAUL AND BRITAIN. By Edward A. Freeman, M.A., Hon. D.C.L., LL.D. 8vo, $1.25.

ROMAN LITERATURE IN RELATION TO ROMAN ART. By the Rev. Robert Burn, M.A. With illustrations. 8vo, $4.

PERSONAL REMEMBRANCES OF SIR FREDERICK POLLOCK, Second Baronet, sometime Queen's Remembrancer. 2 vols., 12mo, $5.

POEMS. By Stopford A. Brooke, M.A., author of 'Riquet of the Tuft,' etc. Globe 8vo, $1.75.

BY THE AUTHOR OF 'JOHN INGLESANT.'

A TEACHER OF THE VIOLIN, and other Tales. By J. H. Shorthouse, author of 'John Inglesant,' 'Sir Percival,' etc. 12mo, $1.

EDMUND BURKE. By John Morley. Uniform Edition. Globe 8vo, $1.50.

GLEN DESSERAY, and other Poems, Lyrical and Elegiac By John Campbell Shairp. Edited by Francis T. Palgrave, LL.D. Globe 8vo, $1.75.

DANTE, AND OTHER ESSAYS. By R. W. Church, Dean of St. Paul's Globe 8vo, $1.50.

A HISTORY OF POLITICAL ECONOMY. By John Kells Ingram, LL.D. With Preface by Prof. E. J. James, Ph.D., University of Pennsylvania. 12mo, $1.50.

"Beyond question the best attainable guide to the English or American student in such study. It would be an excellent thing for the teaching in most of our schools and colleges if the professors of political economy would take a thorough course in the history of the science they essay to teach. They will find Dr. Ingram a most excellent instructor."—*Boston Traveller.*

"Viewed in the light we have placed it, of a historical critique, the work is done with great ability and success."—*Independent.*

CLASSICAL AND EDUCATIONAL WORKS.

CAMBRIDGE UNIVERSITY PRESS PUBLICATIONS.

SOPHOCLES. The Plays and Fragments with Critical Notes, Commentary, and Translation in English Prose. By R. C. Jebb, Litt.B., LL.D., Professor of Greek in the University of Glasgow. Part I. Œdipus Tyrannus. New edition. 8vo, $3.50. Part II. Œdipus Coloneus. 8vo, $3.50. Part III. Antigone. 8vo, $3.50.

"The whole edition so far exhibits perhaps the most complete and elaborate editorial work which has ever appeared. It seems scarcely possible that anything material to Sophocles can have escaped such diligence as these pages show. . . . To the class of readers chiefly interested in a work of this scope, the argumentative parts of it are so valuable that we can wish nothing away. . . . A remarkable achievement."—*Saturday Review.*

A LATIN-ENGLISH DICTIONARY. Printed from the unfinished MS. of the late Thomas Hewitt Key, M.A., F.R.S., Professor of Comparative Grammar and formerly of Latin in University College, London. 4to, $9.

TRAVELS IN NORTHERN ARABIA, from November, 1876, to August, 1878, and in the Peræa in May and June, 1875. By Charles M. Doughty, M.A. With illustrations and map. 2 vols., 8vo, $18.50.

PITT PRESS SERIES. NEW VOLUMES.

HOMER—ODYSSEY. Book IX. With Introduction, Notes, and Appendices by G. M. Edwards. 60 cents.

PLATO—CRITO. With Introduction, Notes, and Appendices by J. Adam, B.A. 60 cents.

CICERO—DE OFFICIIS. Book III. With Introduction and Notes by Rev. H. A. Holden, M.A. 50 cents.

CÆSAR—DE BELLO GALLICO. Books I–III. With Notes by A. G. Peskett. 75 cents.

HORACE—EPISTLES. Book I. With Notes and Introduction by E. S. Shuckburgh, M.A. 60 cents.

LIVY. Book XXI. With Notes, Introduction, and Maps by M. S. Dimsdale, M.A. 90 cents.

MOLIERE—L'ECOLE DES FEMMES. Edited with Introduction and Notes by George Saintsbury, M.A. 16mo, 60 cents.

"In other directions Mr. Saintsbury's clear and scholarly notes are such an illustration of the kind that vivifies textual comment and criticism."—*Saturday Review.*

THIERRY—RECITS DES TEMPS MEROVINGIENS. Books 1–3. Edited by G. Massen and A. R. Ropes. 75 cents.

OXFORD CLARENDON PRESS SERIES. NEW VOLUMES.

A MIDDLE HIGH GERMAN PRIMER. With Grammar, Notes, and Glossary by Joseph Wright, Ph.D. 8vo, 90 cents.

BECKER'S FRIEDRICH DER GROSSE. Edited with Notes and Historical Introduction by C. A. Buchheim, Ph.D. 90 cents.

GEOMETRY IN SPACE. Containing parts of Euclid's Eleventh and Twelfth Books and some properties of Polyhedra and Solids of Revolution, with Exercises. Edited by R. C. J. Nixon, M.A. 90 cents.

MACMILLAN & Co., 112 Fourth Avenue, New York.

The Nation.

NEW YORK, THURSDAY, MAY 3, 1888.

The Week.

THE tariff debate in the House is now in good running order, and the supporters of the Mills bill are certainly not having the worst of it. Mr. Ford of Michigan made a speech on Friday, addressed to the farming interest, showing how oppressive and illusory is a protective tariff which compels agriculturists to pay an average tax of 47 per cent. on the dutiable goods for which their products are exchanged, while their labor is brought into competition with the cheapest and most degraded labor in the world, that of India, where the wages of agricultural labor are only six to nine cents per day. "You may pile tariffs on wheat, corn, beef, pork, and cotton mountains high," said Mr. Ford, "and it will not increase the prices of those products in this country a penny—not a farthing." This is a well-worn truism of course, but one of those that seem hardest to penetrate the bucolic mind. When you have proved to the farmer who has been nourished on Horace Greeley's *Weekly Tribune* that he is selling nine-tenths of his crops in competition with the pauper labor of India and Egypt and Russia, and that there is no help for him, he struggles in a dazed and feeble way to get a little more tariff for the remaining tenth of his products—his potatoes, flax, honey, and wool. And when he fails in this small scheme, he falls back on the comforting thought that he is building up a "home market" for his products. He has been a hundred years pursuing this will-o'-the-wisp, expecting that a time would come when the home market, which he has been so long coddling with bounties drawn from his own earnings, would take all of his wheat, corn, beef, pork, and cotton, and then voluntarily raise the prices of them.

The speech of Mr. Russell of Massachusetts was the best that has been delivered since the opening of the debate by Mr. Mills. Mr. Russell represents a manufacturing State and a manufacturing district. Yet he tells us that not one in ten of the industries of Massachusetts is protected by the tariff, and that of all the industries in the State, the protected ones are those that pay the lowest wages to their workmen. He stated as a fact which was not denied, that all the great manufacturing centres in New England had grown up during periods of low tariffs, and that not one such has been started under a high tariff, or could be started to-day. He adverted to the Walker tariff of 1846 as the one under which the manufacturers of Massachusetts enjoyed their greatest prosperity and largest expansion. So well satisfied was Massachusetts with that experiment that she came forward in 1857 and asked for a further reduction of duties, and obtained it. The tariff was lowered 21 per cent. in that year, and her whole delegation in both houses of Congress voted for the reduction. Here the great interrupter of speeches, Mr. Milliken of Maine, chimed in: "And it produced the panic of 1857." Mr. Russell promptly corrected Mr. Milliken's chronology by showing him that the panic of 1857 came one year before the new tariff went into effect, and was about to favor him with a few words on the panic of 1873, which took place under the great anti-panic Morrill tariff that is still in force, when Mr. Farquhar of New York dexterously shunted the inquiry into another channel by asking what effect the tariff of 1857 had on the public treasury. Mr. Russell said that it had the desirable consequence of reducing the surplus, which was the aim also of the Mills bill. Mr. Farquhar had nothing more to say, and the debate went on, to the great advantage of Mr. Russell and the friends of tariff reform.

Mr. Burrows of Michigan made his speech on the Tariff Bill in the House on Tuesday week. He began with the frank statement that the surplus was certainly $56,500,000 per year, and possibly $75,000,000, and that it must be reduced by one or the other of these sums. He then stated that the only difference between parties was as to the mode and manner of effecting the reduction. Then he affirmed it to be the duty of members of Congress to define their positions clearly, and show exactly how they would reduce the surplus. Having thus cleared the ground and excited a lively curiosity as to the particular mode favored by himself, he launched into a general defence of the great principle of protection to American industry and a general denunciation of the Mills bill, filling eight pages of the *Congressional Record*, ending with a lot of quotations from English newspapers commenting on the President's message, but he never told what his plan for reducing the surplus would be. In a general and very guarded way he was in favor of reducing the internal revenue, and he mentioned the tobacco tax as one suitable to be removed. Beyond that he did not advance. He did not say whiskey once, nor even beer. Mr. Burrows's taciturnity on the particulars of internal-revenue reduction points out the dilemma of the Republican party. The surplus must be reduced, but not by disturbing the tariff. It may be reduced by putting whiskey and beer on the free list, but not by our initiative. How Not To Do It is the great question of the day, the real Republican issue of the coming campaign.

In the appointment of Mr. Melville W. Fuller to the office of Chief Justice of the United States, the President has given the country another surprise, Mr. Fuller being comparatively unknown except in his own city and State. It is a misfortune of the legal profession that its most eminent members, unless they go into political life, are usually restricted to a merely local reputation. When Mr. Phelps was selected for Minister to England, very few persons were able to identify or place him, but it became known gradually that he was one of the great lawyers of the country, and the President's choice has been signally vindicated. When Mr. Morrison R. Waite was chosen by President Grant for Chief Justice, the inquiry was at once raised —"Who is he, and where has he won his spurs?" Among the names suggested and favorably considered by President Cleveland for the position of Chief Justice was that of Mr. James C. Carter of New York. If Mr. Carter had been nominated, it would have been the unanimous opinion of the bar, the bench, and the press of this city that the ideal Chief Justice had been found. Yet the public in Illinois and in the Mississippi Valley generally would have been as much surprised and as curious to learn the facts of Mr. Carter's career as the people of the other States and sections are to learn those of Mr. Fuller. Mr. Fuller is one of those thorough practitioners whose love of the law for its own sake compels them to abjure office and popularity. This trait, conjoined to very engaging personal qualities, to wide scholarship, to rare modesty, and to a character without reproach, gives abundant promise that Mr. Fuller will be equal to the position to which he has been unexpectedly called.

Among the pension vetoes sent in by President Cleveland on Tuesday week was one for pension to William H. Brimmer, a wagon-master in the army. Brimmer was in the wagon service eight months and twenty-five days. Twenty-three years after the expiration of his service he filed an application for pension on the ground of rupture, caused by carrying sacks of corn on his back. In his affidavit supporting the claim he said that he had never mentioned the rupture while he was in the service. In February of the present year a medical examination of the applicant was made, which developed evidence of "a small, uncomplicated inguinal hernia on the right side, which was easily retained." No evidence was offered to show that his military wagoning had anything to do with his ailment. The claim was accordingly rejected by the Pension Bureau. Brimmer then went to Congress and had no difficulty in getting his claim allowed. This case was surpassed in absurdity by another which was reported favorably by the Senate Committee on Pensions, in which the claim of a widow of a colored soldier in New Orleans was allowed on the ground that, although the evidence showed that she was a "woman of the town," her relations had not been sufficiently continuous with any one man to establish a remarriage. Senator Hoar objected to the claim, and it was de-

feated. Regarded as a measure for reducing the surplus, this bill would have been quite as effectual as any.

The news that Commissioner Atkins of the Indian Bureau has resigned, or is going to resign, is good news, because he has not been the real head of his office. The real head of the office has been Mr. Upshaw, and somebody is needed in the office to repress Mr. Upshaw's zeal and activity, and control his actions. Therefore, the promotion of Mr. Upshaw to the vacant place would be a most unfortunate thing, and one which we are glad to believe is not contemplated. Moreover, we doubt much whether any Commissioner can take the Bureau out of politics as long as Mr. Upshaw is in it; and it ought to be taken out of politics promptly, if only as a preparation for the approaching Presidential canvass, because it has not, as conducted of late, been a help either to the President or his party. Mr. Oberly is talked of for the vacancy, and would fill it well, provided he can control Upshaw, but not otherwise. No matter how wise or good the Commissioner may be, his virtues will be wasted unless they are combined with the power to keep Upshaw in subordination.

The House Committee on Education has had the Blair bill before it ever since the measure passed the Senate, and has at last decided, by a vote of eight to five, to report back a substitute, introduced by Mr. Crain of Texas, which provides for the distribution of the proceeds of public land sales to the amount of $8,000,000 a year among the States and Territories in proportion to their total scholastic population. This entirely eliminates the idea of granting aid on the basis of illiteracy, and would give New York, for example, several times as much money as Mississippi and Louisiana, although the latter States have several times as much illiteracy proportionally as New York. Such a proposition is preposterous, and it hardly needs Gen. Boynton's assurance, in his despatch to the Hartford *Courant*, that "the bill will hardly pass this session."

The platform which Senator Sherman had the Ohio Republican State Convention adopt threatens to prove a serious obstacle to his securing the Presidential nomination. On the burning issue of the tariff it is utterly opposed to the attitude of the Republicans in the further Western States. As the Omaha (Neb.) *Bee* sumarizes the plank, it means "simply that the war tariff shall be maintained, and that the people shall not receive the relief from customs taxation which they require and which the public welfare demands; that tariff taxation as it exists should not be disturbed, unless it be to make it more stringent for the benefit of industrial nabobs and corporations that are now reaping great tributes from it." The *Bee* positively declares that the West and Southwest will not subscribe to the "Ohio idea" regarding the tariff as thus enunciated, and it notifies the Republicans of that State that, while they have shown a proper loyalty to Mr. Sherman, and deserve commendation for adhering to him, they need not be surprised if their unqualified attitude in favor of maintaining the war tariff is confronted by an opposition from the West and Northwest which may seriously embarrass the candidacy of Senator Sherman.

We have reserved comment upon the remarkable speech delivered by Mr. Samuel H. Miller, the temporary Chairman of the Pennsylvania Republican State Convention, in the hope of finding some explanation, but without success. Mr. Miller advised that the Pennsylvania Republicans should take the lead in restoring friendship and good-feeling between the two sections, and to this end protested against "a causeless and useless discussion about the captured battle-flags," against "keeping a chronological record of that class of citizens denominated 'Southern brigadiers,'" and, in short, against the whole bloody-shirt policy. He gave this advice not only on the ground that what he urged was right, but also that it was politic, as the sole chance of carrying any Southern State for the Republican party. The speech was a model of patriotism, and the only wonder is how it came to be delivered in a Pennsylvania convention. No explanation has yet appeared, but it seems safe to say that Mr. Miller will find no imitators, for the correspondent of the Philadelphia *Press* reports that his speech was "freely criticised," and "evoked no response in the Convention."

The Republican managers in Massachusetts are in a bad box. Two years ago they allowed the Governorship to be captured by a man who would never have been thought of for the place except because of his wealth. That Oliver Ames fell far below the traditional standard of Massachusetts Governors was too obvious to be questioned; that his nomination represented a sad lowering of the office from the plane of his immediate predecessor—a poor but able man—could not be disputed. But Mr. Ames wanted the place, and he got it, as rich men are apt to do when they make a dead set for an office nowadays. The organs obediently went to work asserting that he was all that could be desired, and he was elected, and re-elected last year. But the managers have always been rather ashamed of the business, and they are now anxious to get rid of Mr. Ames. To this end they have begun serving notice upon him that it is time for him to quit, and that they would feel under great obligations if he would announce his withdrawal. Precedent, however, allows a Governor of Massachusetts three terms, and Mr. Ames declares that he means to have his rights, and shall be a candidate for his party's nomination again this year. His position is impregnable—he simply says that if he was good enough to deserve election at all, he is good enough to deserve it three times, like a long line of predecessors; and the only possible way of meeting this argument is to admit that he never ought to have been Governor at all, which would involve a degree of stultification hardly to be expected.

An amusing feature of the Massachusetts canvass is the attempt of the men opposed to Ames to get rid of him by the vociferous assertion that "it is time to elect a soldier Governor," this claim being advanced on behalf of Gen. Draper, another rich man who wants the place. A quarter of a century has passed since the war, during which period nobody has thought of taking a soldier for candidate, but all of a sudden the party managers wake up to the idea that the State cannot maintain a reputation for loyalty unless it elects as Governor in 1888 a man who served in the war which ended in 1865. This is precisely the same sort of performance that was enacted in Iowa a few months ago. Senator Wilson's term was on the point of expiring, and he had rivals in the party who did not want to see him reëlected. He had made a good record, and there was no sound reason why he should not be continued in his place; so the anti-Wilson men suddenly broke out with loud cries that "it was time to elect a soldier Senator." It was, of course, only a transparent piece of political hypocrisy, and it met deserved failure, as seems likely to be the fate of the similar tactics in Massachusetts.

The woman-suffrage question has come to vote again in the Massachusetts Legislature, as in every Legislature with but two exceptions since 1867. The measure was presented only in the restricted form of a proposition to grant women the right to vote in municipal elections, but it secured only 36 affirmative votes to 107 in the negative. This is the smallest affirmative vote ever cast, and is in sharp contrast with the attitude of the legislators in 1871, when a resolution proposing a constitutional amendment to strike out the word male and give women full suffrage received half the votes in the House of Representatives, and was defeated only by the casting vote of the Speaker. The trouble in Massachusetts, as everywhere else, appears to be the lack of support for the proposed change among the people in whose behalf it is urged. If legislators could be convinced that the majority of women want to vote, there can be little doubt that they would favor woman suffrage; but at present they see no evidence that this is the case.

The investigation of the boycott and lock-out in the brewing trade by the State Board of Arbitration on Thursday brought out the curious fact that the Brewers' Union attempted to boycott the Knights of Labor. Both organizations have engineers and firemen on their rolls. The witness Herbrand, Secretary of the Brewers' Union, was very reluctant to admit that his organization had boycotted the Knights, but the truth came out in the following colloquy:

Q. Your Union belonged to the Knights of Labor in 1886, did it not? A. Yes, but we ceased to be in 1887.

Q. The Knights of Labor have locals of engineers and firemen, have they not? A. Yes.

Q. And so has your Union? A. Yes.
Q. Do you recognize this contract with the seal of your order, stipulating that no engineer or fireman shall be employed in a brewery unless he holds a card of membership in the National Brewers' Association of Journeymen Brewers? (Witness would not give a direct answer.) Did you have it printed for fun then? A. To make up our minds to lay it before the bosses.

Other evidence was dragged out of this witness, to the effect that the Brewers' Union were ordered to parade with red flags after the execution of the Chicago Anarchists, that the witness himself was a contributor to an Anarchist newspaper, and that the Anarchical tendencies of the Union were one of the reasons why the employing brewers had decided to emancipate themselves from the Union. These facts must prove extremely puzzling to the demagogues who dance to the piping of Labor. What is a candidate for office to do when he finds one trade organization stigmatizing the members of another as "scabs," and requiring the employers to sign a contract and turn such "scabs" out of their employment? The situation thus created must prove embarrassing to the most experienced and well-meaning politician. It is so hard to find out what is "organized Labor" under such conditions.

Four out of five of the Committee of the Board of Overseers appointed to consider the subject of athletic sports at Harvard University unite in recommending the Faculty to prohibit intercollegiate contests absolutely. Many of their arguments coincide with those advanced in these columns some months ago, when we were commenting on President Eliot's annual report and his foreshadowing of this important reform. But the Committee also negative the plea most plausibly made on the other side, that college athletics would droop but for the stimulus of intercollegiate rivalry. They say explicitly that "the existing system does not tend to create a general habit of athletic exercise among the whole body of students," but "rather tends to discourage it"; and they cite rowing as a striking proof of this assertion. One member, in a minority report, recommends restricting the contests to the university teams, and letting them be played only with Yale College. This would, of course, abate the present evil, but would be open to most of the old objections, and to this other —that the long-standing feeling of animosity between Yale and Harvard would be intensified, whereas it is in the highest degree desirable that it should be extirpated, and that the two colleges should cease to think and talk of each other as being rivals in a special sense. We therefore hope the overseers and the Faculty will adopt the majority report.

Lord Randolph Churchill has managed to produce another sensation by deserting his Tory brethren in the debate on the County-Government Bill, and attacking the Ministry for their refusal to extend the measure to Ireland. On this point the Ministry are peculiarly vulnerable. They fought Gladstone at the last election on the ground that Ireland, being an integral part of the empire, was entitled to exactly the same rights and privileges as England, and ought to have them, but nothing more, and they were very strenuous in maintaining that good county councils of some sort were just what Ireland needed, and all the Home Rule she ought to get. In fact, they came into office with the cry of equality for the Irish within the empire. Their first piece of legislation, however, on finding that the support of the Liberal Unionists could be positively relied on, was the Coercion Bill, applicable to Ireland only, and giving the Government enormously increased powers not only in punishing, but in defining crime. The execution of this law, too, has been marked by increasing severity. The police and military have been sustained in undeniably illegal courses, savage punishments have been inflicted for really trifling offences, and recently the magistrates have gone so far, doubtless on the suggestion of the Executive, as to increase sentences on appeal when the appeal has been decided against the defendant—a practice which is legal, it is true, both in England and Scotland, but on which no English or Scotch court has ever ventured. Mr. Balfour, the Irish Secretary, too, and the real ruler of Ireland at present, has made a habit of treating the whole Irish question as a huge joke, with which he produces shouts of laughter at Tory dinners and meetings. In fact, one has to go back to the beginning of the century for displays of the same cynical indifference to what are called the principles of popular government. The boldest step the Ministry have taken in that direction is, however, the announcement that they will not give Ireland the same county government as England until the Cabinet thinks the Irish are fit for it, and this announcement is made to a legislative assembly which contains 106 Irish members elected by popular vote. Churchill now says this is going too far, and his revolt is said to have produced a great sensation. But we do not think it will produce more than a sensation. The Tory ranks do not break over incidents of this sort; and the Liberal Unionists will stick to the Government as long as Gladstone lives, or their constituencies are unable to turn them out of their seats.

What the effect of the Pope's decree pronouncing immoral the Plan of Campaign and boycotting will be in Ireland, nobody seems to know as yet. The joy of the Tories and Orangemen over it is most comic, considering the horror they usually entertain of Papal influence, and the extent to which they hold this influence responsible for the ills of Ireland. The more effect the decree produces on the Irish mind, the more sorrowful they would be if they were consistent. But their inconsistency in this is of a piece with the whole of the present attempt to restore order in Ireland. It is a mass of contradictions. The Pope's judgment will almost certainly restrict the activity of the Catholic clergy in promoting the Plan of Campaign, but as long as it is not sanctioned by a threat of withholding the sacraments, the laity will probably keep on in their present course. It is to be observed, however, that there are but few estates now in Ireland on which the rents have not been reduced in proportion to prices, either by the Plan of Campaign or by the action of the Land Commission. Consequently the practical importance of the Papal interference is very much smaller than it would have been a year ago. As to boycotting, it also has ceased, for the same reason, to be a political weapon of much value. The boycotting done now is said to be small in amount and mostly due to private malignity, and can be readily stopped.

The Panama Lottery Bill, now under discussion in the French Chambers, is a much more sweeping measure than an authorization to borrow 350,000,000 francs, as was stated by the *Tribune* last week. Section 1 of article 1 authorizes the company to make an issue of securities amounting to 600,000,000 francs. By section 2 of article 1, in order to answer to the obligations which may be imposed upon it, the company is authorized to add 20 per cent. to the sum of the loan, or 120,000,000 francs, making a total of 720,000,000 francs. Section 3 of article 1 provides that the bonds shall receive an annual interest which shall not be less than 3 per cent. on the nominal capital. Section 4 of article 1 provides that the repayment of the loan and the payment of the prizes shall be guaranteed by a sufficient deposit in trust of French *rentes*, or securities guaranteed by the French Government. The second article of the bill, and by far the most important, authorizes the Panama Company to convert into obligations of the same type (that is, lottery bonds), and under the same conditions and guarantees, all or any part of the loans heretofore made. The significance of this clause can only be realized by consulting a table of the company's outstanding obligations. Six loans have been issued, including the one of March 14, 1888. Of the six, three consist of 500 fr. bonds at 3, 4, and 5 per cent. interest respectively, and three are 1,000 fr. bonds, one redeemable at a fixed date, and two redeemable by semi-annual drawings. The total number of bonds is something in excess of 2,000,000, and the total nominal indebtedness is about 1,500,000,000 francs, exclusive of the 300,000,000 francs of capital stock. Of the last four loans, moreover, there remained unsubscribed about 550,000 bonds, of the par value of 1,000 francs each, or an additional sum of 550,000,000 francs, which M. de Lesseps will find a way to put on the market under the Government authorization. So that the authorization is, in fact, for an amount of over two and a half milliards of francs in lottery securities. *Carte blanche* to M. de Lesseps would not have been more sweeping. Of course, this sum is yet to be raised; even the Government's connivance does not imply inexhaustible credit. The success or failure of the operations on the Isthmus will have a controlling influence in this matter.

MR. BLAINE'S CANDIDACY.

THE election of delegates to the Republican National Convention has already proceeded far enough to show clearly the dominant sentiment in the party as to the candidate for President. State conventions were held last week in Massachusetts and Pennsylvania at the North, and in Florida and Texas at the South, two representative States in each section; and in all, the overwhelming majority evidently desire that Mr. Blaine shall be the nominee. Even in Ohio the week before, it was manifest that the very men who made lip professions of loyalty to Sherman, at heart desired Blaine; and despite all the efforts to tie up the delegates to the alleged "favorite son," it is generally believed that fully half of them cannot, for long at least, be held from following their strong impulses away from him. Iowa and Indiana have shown more sincerity than Ohio in their support of State candidates, but nobody doubts that the delegates are in great danger at the Convention of forgetting that they are supporting home candidates. The scattering talk in two or three other States in favor of local millionaires, like Alger of Michigan and Stanford of California, deceives nobody but the men who are vain enough to waste a little of their wealth in working up "booms" which are too ridiculous to stand exposure to the national scrutiny. The occasional suggestion of men of a higher type, like Hawley of Connecticut and Gresham of Indiana, meets little response, and every such man is fatally discredited by the fact that he has shown independence enough to incur the damning odium of Mugwump praise.

Indeed, nobody can survey the field at this date, less than two months before the meeting of the Convention, without reaching the conclusion that the Republican party wants Blaine for the candidate, and means to have him. From all the evidence accessible, it appears well within bounds to say that three out of four of the party "workers" throughout the country prefer him to any and all other men. The men who in 1876, 1880, and 1884 withstood his candidacy and twice defeated it, are now either quite outside of the party or no longer wield any influence in its councils. The management of the organization is almost entirely in the hands of Blaine men, but no management is required to produce evidence of a Blaine sentiment in the conventions, for the feeling is clearly spontaneous and widespread. A small percentage of thoughtful Republicans still maintain their ancient distrust of the man, and are more than ever before convinced that it would be folly to nominate him, because the experiment has been once tried and resulted as they had always predicted; but the overwhelming majority alike of the managers and of the rank and file want Blaine, and are bent on having him.

The insincerity of the man has never been so clearly exposed as in the treatment by his party of his so-called withdrawal. "My name will not be presented to the National Convention," he wrote in his "Florence Message" of January 25. If this meant anything according to the canons accepted in the interpretation of language among honorable men, it meant that he was outside the field of possible choice. But a week had not passed after the publication of the message before the chief Republican organ, edited by Mr. Blaine's next friend, declared that he had not said that he would not be a candidate "if his party should deliberately judge his nomination necessary to its success or to the safety of the country;" and for two months the *Tribune* has labored to show that this necessity existed, without eliciting a word of protest from the person chiefly concerned. The truth is, that those who really believed that Mr. Blaine meant to withdraw, must have been undeceived by the assurances of Mr. Blaine's intimates in this country that the Convention might safely go ahead and nominate him just as though he had never said anything.

There is only one possible reason why Mr. Blaine should not run. Our theory of party government presumes that a party will nominate for the Presidency the man who best represents it, and whom it most desires to see President. There is no possible doubt that Mr. Blaine stands in this relation to the Republican party to-day. As a loyal party man Mr. Blaine would have no right to say that he would not run except in one contingency—that he was physically unable to stand a canvass or to discharge the duties of the office if elected. A few people who still cherished a belief in his sincerity attributed his so-called withdrawal to the fact that he was in ill health, and they were strengthened in this idea when they found him telling the correspondent of the New York *World*, February 25, that he "could not go through the burden and fatigue of another Presidential canvass." This theory was confirmed by the reports of various people who have seen Mr. Blaine within a few weeks, that he looked like a man badly off with disease of the kidneys. But his spokesmen in this country indignantly resent the suggestion that he is not the very picture of health. The *Tribune* declares that he is "as well as he ever was in his life," and Walker Blaine quotes his mother as writing on April 10 that his father "had not felt so strong and vigorous for many years."

No reason, therefore, appears why Mr. Blaine should not be nominated. His party wants him if he is able to run; his friends say that he is better able to run than ever before. So far as the Mugwumps are concerned, we think that as a rule they, like the Republicans—and the Democrats, too, for that matter—desire to see him nominated. They consider him unworthy to be President, and they hoped that the Republican party would be above nominating an unfit candidate; but as the party wants him, and he really represents the party as it now exists better than any other man, they would prefer to have him run, and get beaten after a fashion that would leave no chance for Burchard excuses.

THE BRUNDAGE TAX BILL.

THE two reports of the Commission appointed to revise the tax laws of New York in the year 1870—the Commission consisting of David A. Wells, Edwin Dodge, and Geo. W. Cuyler—are supposed to be well known to all persons who give special attention to the subject there treated. These reports practically expunged all the arguments previously advanced in favor of the taxation of invisible and intangible things, such as bills of exchange, promissory notes, credits, money at interest, choses in action, cash in hand, stocks and bonds in the hands of the owners. Later reports by State Tax Commissions, whether agreeing with the point of view taken by the New York Commission or not, have served mainly to enforce their conclusions by demonstrating the perfect futility of all the attempts to reach this class of property with any approach to equality by any sort of taxing machinery.

As fresh illustrations we shall invite attention to the report of the Connecticut Tax Commission of last year, and to the more recent investigations of Prof. Ely of the Maryland Tax Commission. The latter are particularly useful by reason of the examinations (made by the writer personally in the States of Ohio, West Virginia, and Georgia) of the practical results of the energetic efforts put forth in those States to unearth and tax the invisible and intangible things which the Brundage bill seeks to reach. It is well known that the State of New York does not attempt to tax these elusive securities. The law does not exempt them, but the law has been allowed to fall into "innocuous desuetude." It is for this reason that the Brundage bill is now brought forward. If due and diligent effort has been made in any State to tax this species of property, and if the result has been a failure as conspicuous as our own, that fact should be taken as an argument *prima facie* against making the attempt here. Now what are the facts?

The Connecticut Commissioners tell us that the present system of taxing intangible things "has now been tested by the experience of thirty-six years, and it is safe to say that it has by no means fulfilled the expectations of its framers. . . . Of intangible property, such as notes, bonds, book debts, and Western mortgages, a small portion only has ever been reached, and this portion is of late growing less and less every year." The law of Connecticut since 1850 has required the taxpayer to make out and return the list of his property under oath. The following table shows the actual workings of the law since 1855:

Year.	Bonds, notes, etc., listed.
1855	$19,186,092
1865	20,521,204
1875	16,355,766
1885	13,208,724

Here is a shrinkage of about 40 per cent. in property of this class returned and actually taxed since the year 1855, whereas it is well known to every intelligent citizen that the holding of such property has more than doubled in Connecticut during that interval. It would probably be within bounds to say

that it has increased fourfold. The decline in the amount of personal property reached and reachable by the tax-gatherer in Connecticut has been in about the same ratio as in New York, where the listing of personal property is not required by the law.

In Ohio, where more diligent efforts are made to secure the taxation of personal property, a similar shrinkage in the actual results has been going on for several years. Gov. Foraker, in his last annual message, pointed out the fact that there has been a decline on the tax lists of more than $33,000,000 since 1883. Prof. Ely quotes the testimony of intelligent citizens to the effect that only 10 to 20 per cent. of personal property is reached by the taxing authorities in Columbus, and a still smaller percentage in Cincinnati. In the smaller towns a much larger proportion of personalty is reached, for the reason, probably, that in the smaller towns the people keep a sharper watch upon each other. It follows that the holders of personal property in the rural districts pay an undue proportion of the State tax, and that this happens in a State where the tax-gatherer's pursuit after personal property is keener, perhaps, than in any other State in the Union. It happens also in Ohio, as in Connecticut, that the property of widows and orphans in the probate courts gets the most disproportionate assessment of all. "A lawyer of standing in Columbus," says Prof. Ely, "who holds estates in trust for several parties, says that whenever he goes to the tax office to pay taxes, he feels capable of committing robbery, arson, and murder, because he is obliged to pay taxes on the full value of estates of two, three, and four thousand dollars belonging to little orphan children, whereas he sees wealthy clients paying on ten or fifteen per cent. of what he knows they are worth."

It was noted by Professor Ely that the State of Georgia is uncommonly well served by her chief taxing officer, the present Comptroller-General, and that his admonitions and instructions to the assessors to look carefully after personal property and see that "no guilty man escapes" have been very persistent and methodical. The taxpayer in Georgia is required to make out the list of his personal property and swear to it. He must catalogue his goods, chattels, watches, furniture, kitchen utensils, moneys, credits, and effects of every kind whatsoever, ships and boats and the property contained therein, all money due to him from within or without the State, and all stocks, bonds, or other securities of corporations within or without the State. After making out the list, he must be examined by the assessor by way of refreshing his recollection, and his answers must be taken down in writing. If he has control or possession of any property belonging to others, he must catalogue that portion separately. When the lists are thus perfected they are turned over to the Grand Jury of the county for a fresh examination, and after they have been scrutinized and passed upon by that body they go into the hands of the tax receiver.

This system is not only the law, but it is faithfully and diligently executed. There is no complaint in any quarter of laxity on the part of the assessors or the Grand Jury, yet the results are extremely unsatisfactory. The Comptroller-General, in his report for 1886, says: "From a careful examination of the digest on file in this office, it is evident to me that such [personal] property is not returned as it should be. . . . A great many merchants and other citizens of this State have borrowed money on bonds, notes, and other evidences of debt owed by them, and have deposited such bonds, notes, etc., as collateral security with the persons from whom they have made such a loan, and *think* that said notes, bonds, etc., being out of their hands on April 1, such property should not be returned by them; this is not true." In the mere article of merchandise offered for sale, which can be seen and handled, he says that not 50 per cent. is returned for taxation. In the whole city of Savannah there were not ten watches returned for taxation. The usual complaint about perjury was rife.

The same story is told for West Virginia. A special Tax Commission was organized and set to work in that State in the year 1884. They reported that not more than one-fifth of the invisible property was ever listed for taxation, and that of the visible personal property listed one-half was assessed 40 per cent. lower than the other half. "All the taxes from invisible property," they say, "come from a few conspicuously conscientious citizens, from widows, executors, and from guardians of the insane and infants; in fact, it is a comparatively rare thing to find a shrewd trader who 'gives in' any considerable amount of notes, stocks, or money. The truth is, things have come to such a condition in West Virginia that, as regards paying taxes on this class of property, it is almost as voluntary, and is considered pretty much in the same light, as donations to the neighborhood church or Sunday-school."

In Wisconsin the same condition of things was found, but that State appears to have drifted into the easy condition of New York, the attempt to tax personal property having been practically abandoned except in the small villages and rural districts. Now, the question for the New York Legislature to consider is whether it is worth while to make a fresh effort to do something which experience has shown, over and over again, cannot be done. In order to answer this question intelligently, let us inquire what the thing is that it is sought to do. It is to impose a penalty of about 2 per cent. per annum for the offence of bringing into or retaining in the State circulating and movable property which gives value to all the fixed property of the State, corporate or real. At the present time New York offers great attractions to this kind of property by the practical exemption she offers from taxation. She has profited by it to an enormous degree. Rich people have come and are coming from all parts of the country to take up their residence among us. Is this desirable or is it not? Is the spending of all this money in and around New York a benefit to the city and State, or otherwise? Would it be wise to reverse the current, and set the flow of capital outward rather than inward? We fancy that there are not two opinions on this subject. We judge that the holders of city real estate would be the first to cry "Hold!" if they observed any movement which tended to check the incoming and to promote the outgoing of personal property.

But we are told that while it is true that real estate in cities derives its value from the presence of personal property, which tends more and more to accumulate in cities, the farming community derives no such benefit, and that thus an unequal burden falls on agricultural land. This is true in part, because the New York farmer has to compete with all other farmers whose products can reach this market; but, on the other hand, the advance in city real estate due to the growth of personal property enables and requires the cities to pay 80 per cent. or more of the State taxes, New York and Brooklyn alone paying 55 per cent., while several of the rural counties actually receive from the State Treasury more money than they pay into it. In point of fact, the taxation of the State of New York is now so extremely light (2 7-10 mills on the dollar of a valuation which is probably not above 40 per cent. of the real value) that we should hardly be aware of the demands of the State Treasury if we did not receive the reports of the Comptroller once a year.

THE BOULANGER CAMPAIGN.

The Boulangist campaign in France becomes, as a study of political manners, more and more interesting. In the first place, far from submitting a programme of any sort to the public, Boulanger firmly declines to say what his plan for redeeming France is. This recalls to some of the wags of the press what was known as the "plan Trochu" during the siege of Paris, or, in other words, a plan which Gen. Trochu had for routing the Germans, but which he refused to communicate to any one until the decisive moment had come, and which, they said, he had in the meantime deposited with a notary. When Boulanger is asked what his plan is, he replies that "this is his secret," and that he should be a fool to reveal it. He cites as a precedent for this reticence the course of Mr. Gladstone in refusing to produce now, while he is out of office, a plan of Irish home rule. Being asked to what party he considered himself as belonging, he declared that he belonged to no party. How could any one think, after what the country had seen of parties during the past seventeen years, that he was going "to brigade himself in a party"? If they had only seen what he saw of parties in the Chamber while he was Minister of War, they would never want to hear of a party again. What he aims at is to convert the "Boulangist party" (*le parti Boulangiste*) into the party of France—a party which would have nothing to do with politics, but would occupy itself with "general interests."

The interview at which these ideas were extracted occurred at Rochefort's house, and when the General was asked how, exactly

and in detail, this Boulangist party was to be formed, Rochefort answered for him that at the rate things were then going, the whole Chamber would be Boulangist in one year from that date, there being already thirty Boulangist Deputies. At this point Boulanger himself took up the tale, and intimated that what he was driving at was the Presidency of the republic, which, when the Chamber was entirely Boulangist, he of course would have, and he would be no more a dictator, he declared, than Grévy or Carnot.

He was asked whether, when he was President, he would go to war. This he denied indignantly, and told the reporter of the *Figaro* he might head the article he was going to write, "Boulanger, c'est la paix"—which of course recalls in a comic way the Napoleonic phrase, "l'Empire, c'est la paix." This, he said, was his answer to placards which had been stuck up all over the country headed "Boulanger, c'est la guerre." The nearest approach to a declaration of his policy which he made was in laying down his dinner knife on the table, and calling the reporter's attention to the straight line made by the blade and handle. "I am just like that line," said he; "why should I be obliged to go to one side or the other?" When he left the room, Rochefort exclaimed: "I adore that man. Did you ever see anybody simpler, or more natural, or, in short, a better fellow?" On the reporter's suggesting modestly that when Boulanger got into power, perhaps Rochefort would turn against him, the latter replied: "That will be *his* affair; but really this time I don't think I am mistaken." The only thing certain and definite that can be extracted, in fact, from the conversations of either the General or his friends is that he thinks he occupies the position which Louis Napoleon occupied in 1851; that the country is tired of parties and of parliamentary government, and wants a great man to take it out of the slough; that he, Boulanger, may, under these circumstances, consider himself "France," and do the best he can to get the Government into his hands. It does not appear that he has now or ever had any political ideas, except such as pass current in French barracks and are produced at mess-tables.

The politicians in the meantime are very much alarmed by him. The best observers felt sure he would carry neither Dordogne nor Nord, but he carried both by large majorities, although the Republican delegation in the Chamber from both these departments, issued addresses warning the voters against him as a dictator in disguise. Even the Reds have denounced him vigorously in addresses and proclamations, but without much effect. The following are some specimens of the stories by which his canvass was helped in Nord: that he was a sailor, and went a-fishing on the banks of Newfoundland before he entered the army, and therefore ought to have the sailor vote; that he is a natural son of Napoleon III.; that he is a grandson of Napoleon I. in this way: A man named Boulanger, who had been a miner, entered the Grand Army under Napoleon the Great, and rose to high rank, and became very intimate with the Emperor, who, having had a child by a Russian princess, begged Boulanger to father it and give it his name, which Boulanger very obligingly did; and the present candidate is the child in question, and ought to have both the miner vote and the Bonapartist vote. Of course there are defects in this story. On the face of the narrative, it would seem as if he were the son and not the grandson of the first Napoleon, and as if, this being so, he ought now to be about seventy years old; but these little discrepancies do not count about election time. Moreover, there is an almanac widely circulated in the rural districts in his behalf, which declares that the signs of the zodiac make it very clear that he will conquer Germany on the 7th of May, 1890, and be proclaimed President of the republic in 1891. One Boulangist stump-orator goes about with a dog, which barks loudly when his master in his speeches mentions the name of Jules Ferry, the principal representative of the Opportunist party. There is a good suggestion in this for our campaign speakers. A dog taught to bark joyously on hearing Blaine's name, and to howl piteously on hearing Cleveland's, or conversely, might produce a good effect among doubtful voters.

It cannot be said that the French Republicans deserve or are receiving much sympathy in this the hour of their distress. They have persisted for ten years in the policy of overturning ministries for trifles, in spite of repeated warnings as to how it would end. No attempt have they made to build up a strong and united party, or to kill the suicidal habit of supporting the Cabinet only in return for "favors" and "recognition." They are rallying now, and trying to show a united front to the enemy—the terrible coming "Cæsar"; but it is humiliating to see the kind of Cæsar he is—a smug-faced soldier who never gained a victory or commanded in a battle, who won his promotion by sycophancy, and has no sign of the hero about him except his seat on horseback, which, however, is admitted on all hands to be rather that of a ring-master than of a great commander.

One thing they are mourning over bitterly—the substitution of the *scrutin de liste*, or general ticket, for the *scrutin d'arrondissement*, or district ticket. This was Gambetta's plan for stopping jobbery among the Deputies, by making each Deputy the representative of the whole department elected on a general ticket, instead of the single representative of one district. He thought that in this way the claims of constituents would weigh less heavily on each member. The scheme, however, has had no great success as regards jobbery, and it is now furnishing the Boulangists with the means of wiping out the minority completely in all departments in which they are a majority. On a general ticket in such cases they carry every seat, and give each election the air of that dreadful thing the "plébiscite," with which Napoleon wrought such execution among his enemies.

INCAPABLE ENTHUSIASTS.

THERE is an aphorism of Lichtenberg's, quoted by Mr. John Morley in his recent lecture, to the effect that enthusiasts without capacity are the really dangerous people. At first thought the saying is paradoxical. It is the enthusiasts with capacity, one is disposed to say, that are to be feared, for they can accomplish something. Yet, if we consider the matter, it appears that the enthusiasts with capacity are the really great men. Giving the word capacity a not unreasonably broad meaning, it is only such men that urge the world into genuine progress. If they led men astray, they would prove their incapacity. There have been perhaps great men who had little enthusiasm, although, of course, they had capacity, but their part has been that of conservators rather than reformers. The great onward lurches of the race have been due to the men of combined fire and steel, of energy as well as intellect, distinguished, in short, by both enthusiasm and capacity.

Wherein, then, lies the danger of incapable enthusiasts? It is in the misdirection of their enthusiasm. They hold up unattainable ideals, and lead men off on hopeless expeditions. In this way they cause a treble mischief. They consume time in futile struggles, they waste energies that would have been available for good, and they throw discredit upon all enthusiasm for reform. They have neither that kind of capacity, called common sense, which enables some men to distinguish between the practicable and the impracticable, nor that capacity, called insight, which enables others to anticipate the direction which progress must take. There is enough of the spirit of self-sacrifice in the world, of "public spirit," to make things a great deal better than they are, if it were properly directed. But if it is scattered and diverted in a thousand different directions and towards inconsistent ends, progress is blocked; and it is in achievements of this kind that incapable enthusiasts accomplish their mischief. Fortunately, as they get in one another's way and quarrel, their results are chiefly negative. They fail to carry out their own schemes, but they succeed in thwarting others. Unfortunately, they disconcert the plans of the wise as well as of the foolish.

For the most incapable of enthusiasts must have a following. No cause is so absurd as not to attract some one when enthusiastically urged, for the reason that enthusiasm is intrinsically attractive. It is a generous trait, and although not incompatible with egotism, it is incompatible with deliberate selfishness. It tends to carry a man outside of himself, and thereby acquires a moral quality. In fact, the predominant meaning of the word seems to be devotion to ends relating to the condition of mankind, and it is rather by a figure of speech that men are said to be enthusiasts in pursuits unconnected with the interests of their fellows. So essentially is man a social animal that whoever declaims to him that great line of Terence's, straightway wins his heart. No matter how fantastic the champion, his spirit is contagious, and by mere enthusiasm he becomes a power. When the major premise is friendship to humanity, it is odious to inquire too particularly into the minor, and if it is believed that a man's heart is in the right place, most people do not concern themselves about his head.

To criticise enthusiasts is thus always an invidious thing, and moreover their prophetic attributes serve them as a protection. Their ideals are all in the future, and as no one knows what the future may bring forth, it

is not easy to show that these ideals cannot be realized. Nor can it be denied that the world has often been mistaken, and pronounced those men incapable enthusiasts who finally have been determined to be great reformers. It is not always the case that great men are very articulate reasoners, and geniuses have a way of reaching their conclusions by instinct or inspiration rather than by logical process. Hence it is inferred that those who do not reach their conclusions by reason must do so by inspiration—a principle that hedges all enthusiasts with a certain divinity. Truly it is not easy to discriminate. Hardly any one would now call John Brown an incapable enthusiast, yet at the time of his epoch-making foray it was thought charitable to call him a madman. He may, perhaps, have reasoned as well as Arnold of Winkelried, or thought not without reason that he could play the part of Samson in the temple of the Philistines. The denunciation that fell upon him was of the same nature as that which fell upon the other abolitionists; they were odious because they were held incapable, and yet the incapacity proved to be rather on the part of the critics than of the enthusiasts.

The case of the abolitionists, however, is an excellent example of the possibility of distinguishing true prophecy from false. For nothing was plainer than that our society would not always tolerate slavery. There was nothing unprecedented in the demands of the abolitionists. Slavery had been abolished before, and it was rather surprising that it should have been maintained so long in a community so far advanced in civilization. No one who pretended to reason could assert that history taught that slavery was a permanent institution, or that it would exist in an ideal state of society. All that could be rationally urged against the abolitionists was that their methods were not the correct ones, or that the time was not ripe—arguments that were refuted by the logic of events if not by that of the anti-slavery party. Hence it was necessary to resort to appeals to the feelings, to coarse abuse, and even to violence against these enthusiasts, who had reason on their side; and when these arguments are employed, there is a presumption against the case of those who employ them. In fact, it may be laid down that the criterion of the capacity of enthusiasts is the attitude of their opponents. The final appeal is to reason; those who attempt to bring their case before other tribunals admit its weakness.

If we contrast with the abolitionists some of the enthusiasts of the present day, the applicability of the distinctions which we have taken becomes apparent. Their declared aim is to increase the wealth of the poor, and they propose to accomplish it by subtracting from that of the rich. It is true that political economy teaches that the accumulation of capital tends to increase wages; but as they dislike the conclusions of that science, and lack the capacity to follow its reasonings, they declare with the greatest assurance that it is obsolete. They propose to abolish the ancient relation of master and servant, and to institute a novel kind of partnership between labor and capital, in which labor shall dictate its own wages, control the management, and share in the profits, while capital shall bear all the losses. They lament the woes of the poor, and rejoice over the formation of trades-unions, whose principal effect and whose avowed object is to shut out the poor from opportunities of work, and whose practice is to persecute those who endeavor to maintain their independence or who try to work in defiance of union hostility. They declaim against the injustice of the present constitution of society, and ignore the injustice which they encourage men to inflict upon one another. They refuse to explain the details of their projected reforms, but the most logical of them are driven into Socialism, and advocate the improvement of the condition of the poor by setting up the Government in business with capital furnished by the taxation of the poor whose condition it is to improve, regardless of the lessons of experience concerning the wastefulness of all governmental enterprises.

The most conspicuous proof of the incapacity of these enthusiasts is their insensibility to moral considerations. The great causes of poverty, vice, improvidence, laziness, and dishonesty, are treated as its effects, and charity to the poor is indeed made to cover a multitude of sins. The outrageous and growing faithlessness of laborers as regards the performance of their contracts meets with no condemnation from these effusive sympathizers with labor. They rave over the corruption of our legislation by capitalists, and ignore the fact that laborers form a majority of the electoral body, and that they prefer to choose representatives so ignorant, so dishonest, and so rapacious that capitalists are compelled to buy them off to avoid ruin. It has not often been the case, in the history of our race, that enthusiasm for justice has been attended with such a disregard for the most elementary virtues. It is a most discouraging sign that so large a proportion of our clergy and of the writers for the "religious" press should have proved themselves incapable enthusiasts by their utterances in these matters. They may not have much positive influence for evil, but they have encouraged so much folly that it is impossible to look for any great improvement in the condition of the poor until this generation has passed away.

IRISH NOTES.

DUBLIN, April 18, 1888.

AFTER a harsh and backward period, spring is coming upon us in all its beauty. Light clouds shadow the hills over which green tints are spreading; the birds answer each other in the hedges—over all there is the indefinable charm of the season. The moral order in Ireland is, however, not changed. A coercive policy is being carried out to the uttermost. William O'Brien was arrested on Saturday, John Dillon yesterday. Numerous are the other arrests, mainly in connection with the meetings in the west on Sunday week, where Mr. Balfour's challenge regarding the suppression of the League was resolutely taken up, and an attempt made to hold meetings in spite of their being tardily proclaimed. Some of these meetings were suppressed with brutal violence. At Ennis the people managed to elude the authorities and assemble in a warehouse opening off a yard separated from the street by a gateway. As they were passing out the authorities came upon them. The people made no resistance, and even opened the gates for the police, who commenced taking down their names. It has been fully proved that not a hand was raised or a stone thrown. Yet into this yard and upon these people charged, by order, police with drawn bâtons, infantry with fixed bayonets, and cavalry with sabres. Many persons were injured. The armed forces of the Crown cannot have had their hearts in the work, or the results must have been fatal. Fortunately, at least one English member was present to see what occurred the same day at Loughrea.

It is difficult to understand the policy of the Government regarding the suppression of meetings. The humane course would be to issue the prohibition as long as possible beforehand, and to give it the fullest publicity; instead of which it is often delayed until the evening before, or the very day of the meeting. Crowds of countrymen attend, and a police charge is to many the first intimation that they have placed themselves in opposition to what is here called law. It doubtless has a discouraging effect, and that may be the intention of the Government. The poor, depending on their daily labor, cannot afford to run the risk of broken heads and disabled limbs. Mr. Balfour also probably wishes to make it appear that every meeting not suppressed is held by his permission. There is never any disturbance where the police and military do not interfere. Of late years, since we became accustomed to the presence of the Government note-taker, he is invariably protected and accorded a place on the platform. Meetings were announced for Sunday week, and at the last moment suppressed. Another was advertised for last Sunday, at New Ross, on the border of a district where the League is suppressed. Large bodies of military were quartered in the town. William O'Brien was arrested on his way to this gathering. Elaborate preparations were made for eluding the authorities and holding meetings elsewhere if necessary. Only when ten o'clock in the forenoon came, and no prohibition had been issued, was it felt with any degree of certainty that the meeting would be permitted. The police and military were confined to the barracks. The Government note-taker marched with the promoters between bands and banners. Perfect order and good humor prevailed, as is always the case when the people are left to themselves. The few police and soldiers off duty that strayed into the crowd passed unnoticed. Some 6,000 persons were present, and the number might have been doubled had there been any certainty of non-interference.

Nothing can be more futile than Mr. Balfour's assertion that he has really suppressed the spirit of the League, and weakened its prestige and organization. He has made it more dangerous; in the proclaimed districts secret gatherings and secret combinations replace open proceedings. The people are more than ever devoted to their leaders. William O'Brien's character has been revealed to an extraordinary degree. The crudeness, bitterness, and exaggeration that too often characterize *United Ireland*, of which he is editor, have led the outside public to underestimate his entire singleness of purpose, simplicity of nature, self-forgetfulness, and religious fervor. It is said by many that he intends, when the Irish question is satisfactorily settled, to enter a monastery, and this I quite believe. Nothing can shake Mr. Parnell's position as leader; but O'Brien and Dillon are the most beloved of the people, sharing personally their difficulties and dangers.

I never travel through Ireland or look beneath the surface here that I am not renewedly and painfully impressed with the dark shadows that inevitably accompany this movement. It is quite different from anti-slavery, or temperance, or any other great agitation in which the mainspring is conscientiousness and philanthropy. In our cause, indeed, such motives characterize the leaders and large numbers of the rank and file, and English support is generally unselfish; but the chief incentive here, so far as the land (apart from the Nation-

al) question is concerned, is personal interest, a desire to escape from the incubus of a land system that is crushing out the life-blood of the country. This personal interest inevitably leads to the assertion of much that is unreasonable, and much actual dishonesty. For instance, the position of prominent Nationalists is often shamefully taken advantage of by tenants. A landlord friend of mine was discouraged from openly joining the movement by a Nationalist leader, who warned him that if he did so, his tenants would take unfair advantage of him. One of the leaders lately applied for rent to a backward tenant, who held land at a low valuation. The tenant admitted this, but said: "I hold another farm at a rack-rent from X., who is not a Nationalist, and I must pay him, and so cannot pay you." As the good and bad landlords stand together, so do the good and bad tenants. Each side believes that whatever is good in the aims of antagonists is overshadowed by what is evil in their methods. Each side condones and ignores the evil in the character and methods of supporters, in view of the overwhelming good which is expected from the attainment of the common object. I do not see why this should be so much the practice here. We are required to keep silence regarding anything and everything objectionable in those who nominally side with us. Perhaps a reason for this may be found in a desire to avoid even the semblance of the division so much desired by opponents, and which has been the curse of Irish politics. Such want of candor, however, provides future complications and perils. The condition of parts of Kerry is appalling. The murder of poor Fitzpatrick at Lixnaw was most brual and unprovoked. Yet, because his daughter Norah had helped to prosecute and convict the murderers at the assizes, when she appeared on Sunday at chapel a large number of the congregation left, despite the protests of the clergy. Moreover, a conviction of the murderers would, I believe, never have been secured if they had not been tried under the Coercion Act in another county. It is easy for an English party to make political capital out of delaying a settlement, but reconstruction will be no easy task, and to us and not to them it must fall.

Regarding land settlement, things are in the accustomed confusion. No government has as yet compassed a real final reform. This tinkering satisfies no one but the lawyers, except, perhaps, the tenants who are purchasing under Lord Ashbourne's Act. Those whose rents were adjusted a few years ago are as discontented as ever. Some 60,000 cases await the courts. Uniform principles of land valuation for separating and defining the interests of landlord and tenant are more than ever seen to be impossible. Men pay large sums for interest in farms, and a few months afterwards go into court and get the rents reduced upon the basis of which they made the purchase. I lately heard of a case in which a tenant of an agricultural holding near Dublin had his rent reduced to £2 an acre, while his neighbor on the other side of a wall sold his land at £800 an acre for building purposes. Ownership in most instances is the only possible satisfactory settlement. How that is to be effected is the difficulty. The people in many districts now hold back, as the landlords formerly did. They still see that the rent and price of a farm depend upon its condition and capacity, and so they prefer to drift and let matters go to waste for a while longer, trusting to what may turn up.

The ascendency class here are jubilant. Several waverers of two years ago have returned to the fold. On the other hand, there are many Protestants more distinctly in touch with the people, and whose ideas of liberty and constitutional government have some bases in conviction, who are becoming aware that a continuance of the present state of things is impossible. A protest against coercion is being signed by Irish as well as English members of the Society of Friends.

As to public opinion on the whole in the United Kingdom, the Tory position is still strong. Mr. Balfour's policy may have to be tested much longer before its overthrow. I doubt whether, if an election took place now, the position of parties would be materially changed. Under all the circumstances of Ireland, and sad as it is for her, I cannot on their own account regret the decision of the thousands of our young people who are taking their fortunes in their hands, and crowding to our seaports to embark for the United States.

I have spoken of the internal condition of this country, and hazarded an opinion as to the state of feeling in England. I cannot conclude without reference to what is generally supposed to be going on in Rome. Archbishop Walsh, one of the ablest and most vehement Nationalist ecclesiastics, has been detained there some months. Contrary influences are evidently at work. Many of the best informed shake their heads, and believe that the Pope will eventually be worked upon to abate the zeal of the clergy in the cause of home rule. Others are firmly convinced that he will never risk in the slightest degree alienating the Irish people. By some it is thought that a temporary settlement is being negotiated which might be urged upon the clergy, as preferable for the interests of the Church to a continuance of the present contest. On the whole, intelligent Catholic Nationalists regard the position of affairs in Rome with some anxiety, while they admit that any action the Vatican may think proper to take would only retard—it could not prevent—the ultimate accomplishment of home rule. D. B.

FERRY'S BALZAC.—II.

PARIS, April 18, 1888.

THE daughter of Mme. Gay, Delphine, who was extremely handsome, married the famous journalist, Émile de Girardin. Balzac was a friend of Mme. de Girardin, but his relations with her husband never became very cordial. When he wrote his 'Médecin de Campagne,' in 1837, he hoped that Girardin would publish it in one of his papers, the *Journal des Connaissances Utiles*, which had 100,000 subscribers (an enormous number for the time); but the editor, who was of a very positivist turn of mind, thought the 'Médecin de Campagne' a very uninteresting *berquinade*, and would give no extracts from it. Balzac was offended; he wrote to Mme. Carraud: "This book is better than laws, or battles even; it is the gospel in action. How many people have already wept over the confession of the Country Doctor! Mme. d'Abrantès, who rarely weeps, has wept over the disasters of the Beresina, and the life of Napoleon told by a soldier in a barn." Balzac and Girardin quarrelled on some other points, and Mme. de Girardin found it difficult to reconcile them when Girardin wished to have some novels for a new paper which he had founded, the *Presse*. Balzac used to go and see Mme. de Girardin only at the hours when he knew he should not find her husband. He made in her house the acquaintance of Lamartine, who afterwards, in his 'Cours de Littérature,' made a very living portrait of the author of the "Comédie humaine." Balzac dedicated to Lamartine his 'César Birotteau.' One of his most extraordinary novels, 'Les Paysans,' which reveals a profound knowledge of the sentiments of the rural population of France, and of the effects of the French Revolution, appeared in the *Presse*. At the very moment when he worked at the 'Paysans' he was preparing for another paper, the *Constitutionnel*, that masterpiece, 'Cousine Bette,' which forms the first part of the 'Parents pauvres.'

The 'Paysans' appeared in 1846. It had no great success—it was too true. Its readers did not find it amusing—they were spoiled by the stories of Alexandre Dumas, the father. Girardin insisted every day on some abbreviations in the feuilleton; Balzac, who cared much for his long and almost photographic descriptions, was in a state of constant irritation. Mme. de Girardin poured oil between the wheels. She had it in mind to make of Balzac a member of the French Academy, as she was intimate with Lamartine, with Victor Hugo, with Charles Nodier, with Barante. Balzac was not very anxious to present himself; his affairs were embarrassed, and his monetary condition very precarious. At the last moment he withdrew his candidacy; Victor Hugo persisted, however, in giving him his vote. Who was elected in his place? I really do not know. Balzac never made the famous visits, so it cannot be said that he ever was a candidate; but it is clear that he was not encouraged, and that, if he had been in the least, he would have presented himself.

In the autumn of 1833, Balzac made, in a hotel at Neufchâtel, Switzerland, the acquaintance of the Countess Hanska, who was with her husband and her daughter. Mme. Hanska, who was of Polish extraction, was at that time thirty years old. She had the peculiar grace and distinction which belong to the women of her race; she spoke French to perfection, and was well acquainted with all the works of Balzac. Her notions were very aristocratic. Count Hanska was a great Russian proprietor, in the Government of Kieff. He invited Balzac to make him a visit at his estate. Mme. Hanska was of a mystical turn of mind, and full of imagination. At the end of 1833 she began a correspondence with Balzac which was never interrupted. The friendship which had sprung up on the Lake of Neufchâtel became, by a constant communion of thoughts, a deep affection. He confided to her all his troubles, his difficulties, his projects. He sent her his portrait painted by Boulanger.

In 1838 Balzac became acquainted with the gifted and beautiful Princess Belgiojoso, who had for a moment inspired a passion in Alfred de Musset. "She has had the good fortune to displease me," wrote Balzac to Mme. Hanska; "her house is well kept, and her people are very witty. I have been there two Saturdays, and have dined once; that will be all." In that same year Balzac, being a little more easy in mind, bought a piece of land at Ville-d'Avray, and built the little house which he has made famous. The view from it is admirable: the valley of Ville-d'Avray, the immense panorama of Paris, the hills of Meudon and of Bellevue. "Forty-five thousand francs more of debt," he wrote to Mme. Carraud. "The folly, you see, is complete now. I must pay, and, in order to do so, I work every night." Still, the speculator—for whoever has read Balzac must know that there was a speculator in him—was satisfied. He wrote to Mme. Hanska that the value of the place would soon be doubled. The truth is, that it was only a source of expense to him. He soon found himself so embarrassed that he entered into a mining adventure. He had read, in Tacitus,

that the island of Sardinia had numerous silver mines, and that the Romans had found much silver in them. He found himself, in 1837, in Genoa, and, remembering these lines of Tacitus, he had a conversation on the subject with a merchant of the town. This old merchant did not much encourage him; but some time afterwards, Carraud, who was a friend of the chemist Biot, having found a method for the extraction of silver from various ores, Balzac determined to go himself to Sardinia. He went to Corsica, and had to cross over to Sardinia in a small bark. He found, after many adventures, the silver district, and, to his great surprise, his old friend from Genoa, who had obtained the concession from the Court of Turin. He came philosophically back to France, by way of Milan and the Alps. His journey had lasted more than three months; it is a pity he did not write an account of it.

In the year 1842 he attempted drama for the first time. He read the "Ressources de Quinola" himself to the artists of the Odéon. The first four acts were heard with interest. "Now, sir," said the actors, "the fifth act." "The fifth act? I have not composed it yet, or, rather, I have not written it; but I will tell it to you," and he improvised his fifth act before the stupefied artists. The piece fell flat. The *parterre* of the Odéon, at that time, was very ferocious. *Quinola* is a cousin of *Figaro*, but his wit was not well understood, and it must be confessed that Balzac had not the sense of stage requirements.

Mme. Hanska, in 1843, became a widow and the mistress of a great territorial fortune, and established herself in St. Petersburg. Balzac had not seen her for a long time. He went to Russia and stayed with her for two months. Mme. Hanska stayed in Dresden in 1845, but she did not allow Balzac to visit her at once in that city; she had several members of her own family in Saxony, and was afraid of their comments. Balzac went, nevertheless, though for a few days only, to Dresden, and made the acquaintance of Count George Mniszech, who became his friend at once. Count Mniszech was then paying attentions to the daughter of Mme. Hanska, whom he married the year afterwards.

Balzac afterwards joined Mme. Hanska for a little time at Baden. He had made her an offer of marriage; this union was to him, in the midst of his troubles, a ray of hope. Mme. Hanska hesitated a little; she admired Balzac, but she was not very young, she was not very romantic, though she was of a poetical disposition. It is easy to imagine that Balzac's courtship was much interrupted. With a degree of sincerity which did not always plead for him, he told all the complications of his existence to Mme. Hanska, who was his confidante and sometimes his adviser. In the absence of his friend, he felt homesick: "Forgive me, I am so unhappy to be in Paris while you are in Naples." He was allowed to go and see her in Rome. He felt a great enthusiasm for the Eternal City. He saw her again at Wiesbaden, and it was at this time that he wrote his masterpieces, 'Cousin Pons' and 'Cousine Bette." They had finally affianced themselves (the engagement took place while they were in Rome), and Mme. Hanska came to Paris; but the marriage did not take place at once. She had adjourned it to the time when their situation should be less embarrassed with business affairs. She had herself many difficulties connected with the succession of Count Hanska, and with her daughter's settlements.

Balzac bought a little house in the Rue Fortunée, and, in expectation of his future wife, turned it into a complete museum. He had the genius of what we now call bric-à-brac, as is well shown in the 'Peau de Chagrin' and some other of his novels. He lived in the happy time when the curiosities of the Renaissance, the beautiful remains of the seventeenth century, the charming *meubles* of the eighteenth century, could be bought for a trifle. Long before the Goncourts, Balzac revealed to us the beauties of the French art of the past. He bought somewhat indiscriminately, but he never bought anything really bad or vulgar. He had Florentine furniture, the commode of Marie de Médicis, the secretary of Henry IV., which he had found in Luynes during a journey in Touraine. Balzac supposed that these two pieces had been presented by Marie de Médicis to the Maréchal d'Ancre. He had also many beautiful pieces—magnificent old panels in carved wood—of the time of Henri II., of the time of Louis XIV. and Louis XV. Balzac was not much of a connoisseur in pictures, but he had the good fortune to find some good pictures of the eighteenth century in France; in Rome, he bought good Italian pictures, as well as a Holbein. We will say nothing of his many *bibelots*.

Balzac has spoken with much feeling of the dispersion of a collection in 'Cousin Pons.' The same fate awaited his own. In the commencement of 1847, he left for Russia, and was received by Mme. Hanska at her château. She was not yet ready to abandon her daughter, whom she thought too young for the administration of a great fortune. Balzac returned to France just in time to be a witness of the Revolution of 1848. This revolution was a great blow to him personally, as it caused perturbation in all his affairs. Literature suffered from politics, his health became affected by his numerous annoyances; the doctors discovered that he had heart disease. His marriage was delayed by the difficulty of obtaining the consent of the Emperor of Russia, and this could only be evaded by the complete donation of Mme. Hanska's estates to her children. Her irresolution came to an end when she saw how ill Balzac really was. His affection had lasted for seventeen years; she saw now this constant friend in a pitiable state of health, she consulted her heart more than her reason. He had fallen ill at her house in Ukraine. When he was well enough to think of travelling, she said to him: "You will not travel alone, you will take your wife with you."

The marriage was celebrated on the 14th of March, 1850, in presence of the Count and Countess Mniszech. On the 20th of August, 1850, Balzac died in Paris. His married life had lasted five months. The sister of Mme. Hanska was married to "Bibliophile Jacob" (M. Lacroix); she died about a year ago at the age of exactly one hundred years. M. Lacroix died a few years ago. In their apartment in the Rue de la Ville l'Évêque, which I visited a few weeks ago, are the few last remains of Balzac—his portrait, when he was young, the portrait of Mme. Hanska, an elderly lady, dressed in the fashion of 1830. Two old servants who had been in the house for many years showed me these remains almost with emotion, when they perceived that my sentiment was more than an idle curiosity. Mme. de Balzac herself died before her older sister, Mme. Lacroix. She lived to the end in the apartment in the Rue Fortunée, but she lived in great distress. She was very unregulated, if not extravagant. She pawned and sold, one after another, the fine objects collected by Balzac; and, after her death, at the beginning of 1882, whatever remained of the collection, and the house itself, were sold.

Correspondence.

THREE CASES.

To the Editor of The Nation:

Sir: Mr. Goschen, the British Chancellor of the Exchequer, has just brought in the annual budget. The most remarkable thing about it is not the conversion of debt, as that, though it required coolness and nerve, was merely a question of price. Our own debt has been converted, though more easily, yet in the same way. Nor do I now raise the question as to the policy of paying debt or reducing taxation. What makes it of such interest is the ease and quietness and rapidity with which a year's finance is settled. Mr. Goschen, speaking exactly as if it were his private purse, calculates the balance of his income and expenditure within 2½ per cent. of the whole, and this is a large margin, as the calculation in some years runs as low as 1 per cent. or even less. With his surplus he proposes to take a penny off the income tax, but as that would require rather more, he takes an increase of certain assessed taxes. That is all there is of it. There is no committee to overhaul every year all the principles of taxation, and every branch of revenue and expenditure, throwing the country into a paroxysm of terror, and never coming to any intelligible conclusion at all. Mr. Gladstone and Mr. Morley may criticise the wisdom of this special action, but it is well understood that what the country needs in finance is quiet and a steady policy; that the man who has the responsibility must also have the power, and that Parliament must not interfere. Yet the responsibility is also sharply enforced, as in the case of the famous match-tax, which ruined the career of Mr. Robert Lowe as a financier. None but a first-class financier can hold the position, and a proved man of that type is allowed to have his own way. Mr. Goschen's success has done probably more than any one thing to strengthen the present Ministry.

Let us now cross the Channel. There are, or rather there were, two financial authorities in France, the Finance Minister and the Budget Commission, but the struggle which, of course, took place between them has ended in a complete victory for the latter. The life of ministries, which in the first years of the republic was counted by years, came down to months, then to weeks, and is now almost a question of days. Of course, a finance minister of this kind can have no policy. Each new incumbent submits his ideas, which the Budget Commission treats with contempt. But that Commission, like the dog in the manger, will neither let anybody else do anything nor do anything itself. It desires unlimited expenditure, but does not wish to impose taxes; is ambitious to revise the system of taxation, but fears that the hostility of interests newly taxed may outweigh the gratitude of others relieved; and so it goes on granting the Minister a month's continuance at a time of previous rates, and with a chronic deficit is drifting on towards Niagara. The disorder of public finance is extending also to private. First, there is the gigantic speculation which has undertaken to control all the copper in the world, and now De Lesseps's Panama lottery scheme, which was steadily refused by the Ministry as long as there was a ministry, seems in a fair way of being passed by the Chambers, if it has not already been, and with some prospect of involving a guarantee on the part of the Government. The Boulanger craze does not necessarily mean war, but may merely express the desire of the country to see somebody

at the head of the Government with the capacity to rule.

Coming now to this country, we find the Secretary of the Treasury in a legal position rather worse than that of the French Minister of Finance after defeat in a long conflict—that is to say, he has no power at all over financial policy, which is confessedly in the hands not merely of one, but of two committees of the House of Representatives, not to speak of two others of the Senate. Setting apart the external circumstances, have we anything to boast of in financial management over the French Chambers? Not merely as to the tariff, but as to banking, currency, and silver, the financial problems are among the most important for the future of this country, while our machinery for handling them is about the worst that could be devised.

There is nothing whatever, except the greed of Congress for power, to prevent our having the benefits of the English method, with this additional advantage, that as the President is elected by the people, and as the Secretary of the Treasury is his chosen agent, that official would not even be as dependent upon Congress as the Chancellor of the Exchequer is upon Parliament, and would, with the President and the country behind him, stand in a relation to Congress very different from that which has ended in the complete prostration of the French Ministry. G. B.

Boston, April 28, 1888.

THE STATE OF JAPAN.

To the Editor of The Nation:

Sir: Your article in the *Nation* of February 16, under the title of "Coercion in Japan," seems to me to do so much injustice to this country and its civilization that I am constrained, as a well-wisher of Japan who has gained some knowledge of her people by eight years of residence and constant intercourse, to ask the privilege of a few words upon the other side.

The occasion of the article, as your readers will remember, was the so-called "Law for the Preservation of Public Safety," the main point of which was the authority it gave to warn suspected persons off from the capital and put them under police surveillance. This certainly was a most extraordinary act, and it is not my purpose to defend it. Yet it must be said in justice upon the other side, that no one is in possession of the information which would show whether the law was necessary or not except the Government which promulgated it. Your statement that the law was applied to several hundred "children, boys, and men" would seem to any one who did not know Japan quite conclusive evidence of the enforcement of the law with most unnecessary harshness. But as a matter of fact the most dangerous class in Japan is its boys, even boys so young that without great inaccuracy they might be described as children. The advance in education has been so great that boys of fourteen or fifteen, who have been trained in the Government schools, are in most cases possessed of a good deal more knowledge of certain kinds than their parents. That they should be conceited, opinionated, and headstrong, goes without saying. Large numbers of the brightest of such boys are sent off at from fourteen to sixteen years of age to complete their education, usually in Tokio. Here they are possessed of an amount of liberty never thought of by young America in its wildest dreams. With a monthly allowance from their parents or friends, and absolute liberty in many or most cases to choose their own studies and their own schools, with all the Japanese boy's precocious interest in political and social questions, and extraordinary facility of speech, and with absolutely no ballast of experience or mature reflection, is it surprising if the Government has to look sharply after the "children and boys"?

But, passing by this, let us come to that general survey of the political state of Japan which forms the bulk of your article. And first for the general statement in your concluding paragraph—"The prospect of Japanese absolutism becoming a constitutional monarchy, or her people having any real share in the functions of government during this century, is now exceedingly remote." To which I reply, that the people of Japan already have a real share in the functions of government. For some years each prefecture has had a representative assembly, which absolutely controls all local (as distinct from imperial) taxation, and has full power to determine how the funds thus raised shall be used, subject, of course, to the general law of the empire. Appropriations for schools, roads, bridges, etc., are all made by these local assemblies. Six or seven years ago there was a good deal of dispute between the various prefects or governors and these assemblies over the annual appropriations. All these disputes have been quieted by the logic of events, which has shown clearly that in such matters the real power was in the hands of the people, and the prefects, in making their annual estimates, must calculate not what they would like to have, but what they are likely to get.

Besides these prefectural assemblies, there are councils having analogous powers in towns and villages. The property qualification for voters in the election of members of the former is the payment of a tax on real estate of $5 per annum; in the case of the village and town councils it is considerably less. That the movement is still in the same direction is shown by the fact that there are now measures pending in the Senate, and likely to be carried through, giving increased privileges of self-government to cities and making the mayors of towns and villages elective.

Another straw showing the movement of the current is shown in a case now pending in the Superior Court of this city. An election to fill a vacancy in the Assembly of a recent prefecture was recently held. Party spirit ran high. The sub-prefect who had the counting of the votes was of the minority party, and, if report be true, threw out, on the ground of mistake in the writing of a name, votes enough to elect his candidate, and reported to the prefect accordingly. The prefect accepted his report and declared his candidate elected. For this he has been indicted at the instance of the opposite party, and, appointee of the central Government though he is, must now stand his trial in the ordinary courts of law, for accepting and giving effect to the report of his subordinate. This is but one of many indications that the power of popular government as already established in Japan is growing stronger day by day.

What the new Parliament will be no one can yet say. That it will not be a mere sham is pretty evident from what has been already done. That it will wield from the start such power as that of the British Parliament is highly improbable, and also, it seems to me, highly undesirable. Surely no true friend of Japan can deliberately wish that her people should attain at one leap to liberties which it has taken the English race centuries to acquire and to learn how to use. If all that is acquired in 1890 is a parliament after the Prussian model, that surely ought to be enough for one year; and so much, added to what is gone before, of fulfilment of the Mikado's promise to form a government founded upon public opinion, should acquit Count Ito and his subordinates in the Cabinet of accusations of "rank treachery," or of "turning the imperial oath into perjury."

Passing by such an error of detail as that the present leaders of the Government have been "busy for years in crushing three great rebellions" (the only great rebellion was that of Saigō in 1877, crushed in nine months, the next in importance being only great enough to cost the people of Japan three cents apiece to put down), and passing to the representation in your article of the present political condition of this country, there is a curious air of anachronism about it, as if the article had been written by some one who had been in Japan fifteen or twenty years ago, and, while keeping up more or less since with the general course of outward events, had entirely failed to realize the immense change in spirit which these years have brought. Assassination or beheading may be the "Asiatic method of asking for the resignation of obnoxious Cabinet officers," but it is certainly not the method now or lately in vogue in Japan. Of recent Ministers of State, Kuroda, in 1882 or thereabouts, and Inouye, in 1887, were driven from office by popular opinion—the former for alleged corruption, the latter for too great concessions to foreign Powers in the negotiations for treaty revision; but neither has met with any tragical fate. Okuma, Itagaki, Tani, and Soyeshima are names of some who have quietly withdrawn because of disagreement with the party in power, Okuma and Itagaki becoming leaders respectively of the moderate and advanced Liberals. There has been no instance of a Cabinet Minister beheaded since the revolution which established the Mikado's Government in 1868, and no beheading of anybody since that form of punishment was abolished in 1873. Capital punishment in any form is now reserved for cases of high treason, murder, and sometimes arson, and can be inflicted in no case whatever except by due process of law, through the agency of the courts, as is the case also with all punishment for felony. A good instance (one out of many) of the absence of blood-thirstiness in the treatment of political offenders is Mr. Mutsu. He was convicted of complicity in Saigō's rebellion, condemned to five years' imprisonment, released at the end of two years and a half, in eighteen months more put into office, and now goes to represent his country as Minister at Washington.

As for removal of ministers by assassination, there were three cases in the years immediately succeeding the revolution of 1868. But these are in no sense indicative of the present condition of the country. Since then there has been an attempt on the life of Iwakura in 1874, and the assassination of Okubo in 1878, and that is all—not enough, surely, to give occasion for any special airs of superiority on the part of a country which has lost two Presidents by assassination in twenty-three years.

For other points in your article: the heavy taxation is hardly to be avoided in a country which has had to provide itself *ab initio* with the appliances of modern civilization. The refusal of foreign Powers to allow Japan to levy any but nominal import duties makes the burden heavier by placing it all upon domestic products. It is true that a good many millions are spent on the army and navy, but is not that excusable in a country which has

at her back Russia, to whom Yezo would be so great a prize? It is true, also, that the general Government spends comparatively little on education, but then it must be remembered that all primary, secondary, and normal schools, with a number of medical schools besides, are supported by the local authorities, and that the school system so supported compares favorably with that of the most advanced nations.

Surveying the whole field, I cannot see that there would be any special danger in at once placing American citizens here under Japanese law. For my own part, I would far rather be under the jurisdiction of the courts of Japan than those of a good many countries in which we make no claim of extra-territorial jurisdiction.—Respectfully yours, T. S. Tyng.

Osaka, Japan, March 27, 1888.

VILLAGE COMMUNITIES AND THEIR NEEDS.

To the Editor of The Nation:

Sir: Each summer the wealth and culture of our cities are brought in contact with the class who have always been the bone and sinew of this as well as of every other land. It has been and is our opportunity. How are we using it? What do we leave behind us besides our money? In a few instances the duty has been recognized to the extent of adding a few books to the village library or of raising a subscription for the clergyman or his wife. Should it stop here?

This is not an appeal for almsgiving, nor for the founding of an institution. It is an appeal to the thoughtful to devise means by which the energies of the people can be so directed that, while the families preserve their individuality and dwell apart, the members of each family may have more reward for their labor, and attainable objects for their ambition.

Fifty years ago there was less difference than now between the farmer's son and the merchant's or banker's son, both in facilities for training their faculties and in the opportunities for exercising their powers when trained. As towns grow into cities, educational advantages increase, but so also does the cost of living. The farmer's dollar comes no faster than it used to come, but it used to go further in getting board for the son or daughter who came to the schools or colleges of our towns. In a letter of Mr. Longfellow's, dated February 7, 1825, he estimates his expenses for a proposed post-graduate course at Harvard thus: "The only charge is $1 per quarter for the use of the library. Room rent is from $30 to $50 per year, and board from $2 to $3 per week. The expenses for one year will not be very great—$184 I suppose to be about a fair calculation" (vol. i, p. 59). Now President Eliot puts from $500 to $800 a year as the lowest estimate of necessary expenses at the same college. Is not this a reason why foundations or scholarships or prizes should be established in country districts, to be competed for by the children of the schools, and which, when gained, should enable the possessor to choose a higher school or college wherein to carry on his education? Let the prize be a stated sum paid quarterly, through a year or two or three, and let the one who earns it choose the place where he is to spend it. There is no degradation in receiving aid that has been already won by effort, and the effort once made is the best assurance that it will be made again. Scholarships in colleges are good, no doubt, but the young men would better earn them by what they have already done in schools than by what they promise or hope to do if they are given the opportunity. In England there seem to be a number of these foundations.

Education does not, however, solve all problems. A dozen years spent in a small rural community enables the writer to assert confidently that more handicrafts of the lighter sort are greatly needed. The gain would be very great if the element of beauty could also be added to the employment. Life is very monotonous in a village, and there are but few ways of gratifying the artistic instinct, which of late has been over-stimulated in both town and country without being wisely guided in either. Is there no one of leisure and of taste in our cities who yet retains enough practical knowledge of men and of affairs to come forward with a well-thought-out scheme for employing the energies of the family without removing the individual members from the household? Among the mountains of New Hampshire the women still spin and weave the wool taken from the sheep that have been raised on the hillsides. Can they not be instructed in the combination of colors, or in the producing of dyes that may make their cloth both more attractive and more salable than it now is? Will not young women aid in the work by wearing in the villages the cloth that has been produced there?

Might not schools or classes for the instruction of men and boys in woodcarving be established? Give them models to train their eyes, and tell them what is wanted in the hand-carved woodwork of our houses. Let them cut the timber from their own farms and work it in their own barns. The water that runs down the mountain can take the place of steam, when power is needed to reduce the log to the needed shape. A few lectures on the time of cutting down the tree and the seasoning of the wood, some object lessons in carving, and an assured market for the result of their labor, ought very soon to turn a whittling Yankee into a prosperous artisan in the working of wood. A traditional chamois perched on an impossible rock might not be attained for years, but many of us would be content to wait æons for it if we were assured that a more useful and practical industry were arising among our forests.

There is one mode of increasing the income of the inhabitants of the mountains that I protest against. It hurts my pride as an American to see a child of parents who have been born on the soil, hold out a few miserable apples in one hand and a cap in the other to receive an alms, or to have the gate opened for a guerdon, when one drives through the farm, by a child who ceases to watch for one's return if the guerdon has been paid. The right of a farmer to receive compensation for a way through his fields to a view point, should be recognized; but let him keep his road in order, and exact a fair and fixed toll at the entrance, instead of turning his children into sharpers or beggars. Such training may be admirable for a future book agent or a peddler or a ward politician, but it was not in this way that Lincoln and Garfield fitted themselves to be statesmen and leaders and finally Presidents. M. N. S.

EXTREMES MEET.

To the Editor of The Nation:

Sir: In the notice of Mr. Adolphus Trollope's Reminiscences that appeared lately in the *Nation*, your reviewer quotes a grim story of Garibaldi's saying—

"As for the priests, they ought all to be put to death without hesitation, and without delay. 'Rather a strong measure,' I venture to say. 'Not a bit too strong, not a bit,' he rejoined warmly. 'Do we not put assassins to death? And is not the man who murders your soul worse than the man who only kills your body?'"

It is pretty to notice, as Mr. Pepys might say, how exactly this argument of an advanced modernist coincides with the reasoning of the Angelical Doctor in his justification of the burning of heretics. This is the way St. Thomas Aquinas puts it in the *Summa 2da, 2dae, quaest*, xi, *art.* 3:

"Multo enim grauius est corrumpere fidem, per quam est animae vita, quam falsare pecuniam, per quam temporali vitae subuenitur. Unde si falsarii pecuniae vel alii malefactores statim per saeculares principes juste morti traduntur; multo magis haeretici statim, ex quo de haeresi convincuntur, possunt non solum excommunicari, sed et juste occidi."

H. W. Fay.

Westborough, Mass., April 27, 1888.

Notes.

D. C. Heath & Co., Boston, have in press 'Chemical Problems,' by Drs. Grabfield and Burns, of the Massachusetts Institute of Technology.

W. S. Gottsberger will shortly publish 'Poems,' by Rose Terry Cooke; and 'From Lands of Exile,' from the French of "Pierre Loti," by Clara Bell.

The next of the American Commonwealths series published by Houghton, Mifflin & Co. will be 'Missouri,' by Lucien Carr.

A History of Germany in two volumes, octavo, by Theodore S. Fay, formerly U. S. Minister to Switzerland, is about to be put to press by A. S. Barnes & Co.

Thomas Whittaker announces 'The Names of God in Holy Scripture,' by Andrew Jukes.

John Richard Green's 'Short History of the English People' has been translated into French by M. Auguste Monod, and will soon be published by Plon & Nourrit in two octavo volumes. M. Gabriel Monod, the editor of the *Revue Historique*, has written an introduction to the work, which is given in the *Revue Bleue* of April 7, under the title: "La France et l'Angleterre; leur développement historique, leur génie, et leurs institutions." This is a short and clear exposition of what M. Monod calls "the historical circumstances and material conditions" which have made of the two races, so similar in many of their original elements, nations now so different from each other in most of their characteristics and institutions.

Under the title of 'Civilization in the United States: First and Last Impressions of America,' Cupples & Hurd, Boston, have grouped in book form the late Matthew Arnold's estimate of Gen. Grant, based upon the latter's Autobiography; his "Word about America," and "Word More about America," and final "Civilization in the United States." The order, as will be observed, is not chronological, and the publishers have omitted to indicate when and where these several papers appeared, or to give the dates of Mr. Arnold's visits to this country. The collection, therefore, is not quite so fair to Mr. Arnold or so instructive to his readers as it might easily have been made.

What Mr. Robert Browning calls "the present and final edition" of his poetical works has begun to be issued by Macmillan & Co., in an unpretentious but well-printed and very handy form. The first volume contains "Pauline" and "Sordello," and, after twenty years' endurance of the former poem in its original crude and boyish state, Mr. Browning

has felt justified in mending and strengthening its style. The type of this edition is admirably large and clear.

From the volume, 'A Comtist Lover, and Other Studies,' Elizabeth Rachel Chapman has extracted for separate publication her analysis of Tennyson's "In Memoriam" ('A Companion to In Memoriam.' Macmillan). We should ourselves be somewhat shy of joining in the "cordial reception" which the author tells us has been accorded to this prose argument. A test of her capacity for the task may, we think, be found in her selecting from the stanzas, "Ring out, wild bells," the "grieving overmuch for those gone before" as the chief evil to be rung out with the dying year.

We praised last year, and are glad to praise again, the well-devised 'Vacation Journal: a Diary of Outings from May until November, with Hints and Information for Tourists' (A. D. F. Randolph & Co.). It is a pretty and a useful volume for pocket or satchel, with poetical extracts for each day, names and addresses, botanical descriptions, tennis laws, etc. Under June we notice that a stanza from the "Ancient Mariner" is ascribed to Whittier.

'Walks in Paris' and 'Days Near Paris' (New York: George Routledge & Sons) are two more of those semi-literary guide-books with which the name of Augustus J. C. Hare is associated. They are pleasantly written, and give a quantity of useful and interesting information and a large amount of more or less apposite and more or less edifying quotation. The illustrations, from the author's own sketches, are pretty and truthful. It is to be regretted that there is no indication of the date of writing. In matters such as the arrangement of works of art in the great galleries this is of importance. To an old haunter of the Louvre the arrangement of the pictures as given by Mr. Hare sometimes seems unfamiliar, and one asks one's self in vain whether his description is that of an earlier or of a later arrangement than the one remembered. In one instance Mr. Hare is certainly out of date. The magnificent "Victory of Samothrace" is no longer in the Salle des Cariatides; it is now some years since, with the addition of the wings and other fragments, it was set upon its original prow-shaped pedestal at the head of one of the grand staircases, where its effect is indescribably impressive. Mr. Hare's selection of works of art for mention is of the usual guide-book kind, and it is natural that one should find Murillo's trivial "Immaculate Conception" marked with the conventional star, and followed by the conventional mention of its price; but how did it happen that there is no mention whatever of one of the supreme *chefs d'œuvre* of the collection, the "Antiope" of Correggio?

The fifty-fifth issue in "Morley's Universal Library" (Routledge) is W. M. Praed's 'Essays,' a first collected edition of this writer's prose. In the humbler series (in size and style of production only) likewise conducted by Prof. Morley, "Cassell's National Library," we can now enumerate Bishop Jewel's 'Apology of the Church of England,' Don Manoel Gonzales's 'London in 1731,' the first volume of Sir John Malcom's charming 'Sketches of Persia,' Spenser's 'Shepherds' Calendar,' with a comparison of Clement Marot's Eclogues of Pan and Robin; and Shakspere's "Much Ado About Nothing," with much helpful elucidation, including the well-known tale from Ariosto's 'Orlando Furioso.'

A school edition of "Much Ado About Nothing," with notes and a glossary, edited by K. Deighton (Macmillan), is on our table with other text-books hardly more than to be named at this time—a comely edition of Wordsworth's 'Prelude' (D. C. Heath & Co.), edited by Prof. A. J. George of Boston University; 'Atalanta's Race, and Other Tales from the Early Paradise by William Morris' (Ticknor & Co.), edited by Oscar Fay Adams and W. J. Rolfe, with notes, woodcuts, and a portrait; Scott's 'Lay of the Last Minstrel,' edited in Ginn & Co.'s series of "Classics for Children" by Mrs. Margaret Andrews Allen; Alexander E. Frye's 'The Child and Nature, or Geography Teaching with Sand Modelling' (Hyde Park, Mass.: Bay State Publishing Co.), a suggestive if in some ways a rather fantastic book; 'Geography of the British Isles,' by Archibald Geikie (Macmillan), a miniature school-book, useful on this side of the water principally as a supplement to our own geographies—poor enough, as a rule; and 'Erzählungen aus der Deutschen Geschichte, für Schule und Haus' (Henry Holt & Co.), by Josepha Schrakamp—judicious selections from standard German historians, with notes.

We gave a few months ago a review of the new and fine edition of Gillespie's 'Surveying,' published under the editorial supervision of Prof. Staley of the Cass School of Applied Science. Prof. Carhart, who fills the chair of Civil Engineering in the Western University of Pennsylvania, and his publishers (Ginn & Co.) seem to have thought that there was still room for another work at least in the department of "Plane Surveying." Certainly neither author nor publishers have spared any pains to produce a book worthy of the patronage of the profession. We notice two new features in the work. F. H. Robinson, C.E., formerly a colleague of Prof. Carhart, and now City Engineer of Wilmington, Del., contributes a chapter on city surveying. Chief-Justice Cooley of Michigan treats of the "Judicial Functions of Surveyors," in a chapter of great interest not only to the profession, but to the public at large. Justice Cooley, in very pleasant but very decided language, reminds surveyors that in surveying private property their duty is to find the old metes and bounds, not to establish new ones; and though a modern surveyor with his more refined methods may be able to demonstrate that an old surveyor a half century ago was considerably "out" in his courses and distances, yet, in a court of law, long and peaceful acquiescence is worth a great deal more than refined calculation. We have seldom seen a scientific book of which the make-up was more pleasing to the eye, or which promised to be more serviceable.

Prof. Kalogeras of Athens has just published (1887), for the first time, the Commentary of the Greek Father Euthymius Zigabenus (or Zygadenus), who died about A. D. 1118, on the Epistles. We have long had his valuable work on the Gospels, a copious but less helpful commentary on the Psalms, and some dogmatic and controversial works. The new publication, making 1,350 octavo pages, is a quite important addition, giving commentary upon all the Epistles of Paul and upon the seven General Epistles. The work is of much the same character as that on the Gospels, being largely founded on Chrysostom and his school, whose views are tersely and in general clearly stated, but giving also a good deal that appears to be original. The editor has laid the whole world of New Testament interpreters under obligations by issuing this carefully and clearly printed publication. Along with many honorary offices, as Archbishop, Professor of Theology in the University of Athens, etc., his chief task is to be tutor to the Greek Prince Constantine, to whom he addresses (in Greek) a copious and amusingly eulogistic dedication.

The most frequent subjects of the dramatic literature of the sixteenth century are the stories of Susanna, the Prodigal Son, and Joseph. Alexander von Weilen, in 'Der Aegyptische Joseph im Drama des xvi. Jahrhunderts,' records eight Latin and nineteen German plays, composed from 1534 to 1625, that are occupied with the legend of Joseph. Crocus, the Dutch Jesuit, published a play in 1536, which served in a measure as a model to the principal religious play writers of this period, the Alsatian Gart, Macropedius, and Voidius. The piece by Gart has within a short time been edited by Erich Schmidt. One curious play mentioned by Weilen has for title "Josephine vendu (*sic*) par ses sœurs."

From the Permanent Secretary of the American Association for the Advancement of Science at Salem, Mass., we have the customary annual volume of Proceedings, recording the thirty-sixth meeting last August in this city. The address of Prof. E. S. Morse, the retiring President, is given in full, while the various papers read are usually summarized or simply indicated by title. There is a full list of all the meetings held by this peripatetic Association since September 20, 1848, and by its forerunner, the American Association of Geologists and Naturalists.

Mr. Sidney S. Rider does a good service in his (Providence) *Book Notes* for April 28, by tracing the history of the suffrage in Rhode Island down to the recent revolutionary Constitutional Amendment. He points out that the qualification of the possession of ratable property proceeded fnom the King of England and not from the Colonial General Assembly; that it was retained in Dorr's People's Charter of 1842, and is now retained when the object of the vote is to impose a tax or for the expenditure of money. Mr. Rider prints side by side the new amendment and the corresponding sections from Dorr, and gives some curious facts concerning the latter's rough draft, now in the editor's possession. The adoption of the more liberal amendment is the avenging of Dorr. As illustrating the fraudulent voting engendered by the old restrictions on suffrage, Mr. Rider tells of the practice, on the part of political leaders, of dividing lots of land into pieces, and giving recorded deeds for them at each election to voters who used the deeds at the polls and immediately returned them for cancellation.

Some interesting tables, comparing the wages paid in France for certain classes of labor in 1853 with those paid in 1884, are given in the *Revue Scientifique* for April 7. In the whole country, exclusive of Paris, the wages "pour la petite industrie" have increased from 1 fr. 89 to 3 fr. 17, or an increase of nearly 66 per cent.; the wages of the women being about half that of the men. In Paris, for the same class of labor, 3 fr. 81 was paid in 1853, against 5 fr. 84 in 1884 for men, 2 fr. 12 at the former period and 2 fr. 90 at the latter for women—an increase of 53 and 37 per cent. respectively. The wages "pour la grande industrie" can only be compared for four years, and the changes have been slight. Women's wages in these classes have fallen in Paris from 2 fr. 67 to 2 fr. 58, but in the country they have risen from 1 fr. 76 to 1 fr. 79. The wages of engineers ("ouvriers chargés de la marche des moteurs") in Paris have increased from 5 fr. 61 to 5 fr. 71; in the departments from 3 fr. 96 to 4 fr. 04.

The principal article in the *Scottish Geographical Magazine* for April is Mr. J. Y. Buchanan's account of his explorations in the Gulf of Guinea. The article is illustrated by dia-

grams and numerous tables showing the temperature of the water at different depths. The discussion of the Welle-Makua problem is continued by Mr. J. T. Wills. According to the *Mouvement Géographique*, this question has been finally settled by Capt. Van Gèle, an officer of the Congo Free State, who professes to have traced the Mobangi or Ubangi to a point where he was able to prove its identity with the Welle-Makua of Schweinfurth and Junker. This report, however, needs confirmation.

The April Proceedings of the Royal Geographical Society opens with a description of a 'Journey into the interior of Labrador' by Mr. R. F. Holme. Not only has this country never been explored, but very few white men have ever crossed it in either direction. Mr. Holme himself was unable to get more than 150 miles from the coast, on account of the failure of his provisions. The interior presents a sharp contrast to the coast both in appearance and climate. The barren, cold region of the seaboard ceases about twelve miles from the water, and a luxuriant forest growth begins, which extends over the whole country "with the exception of a few spots, chiefly towards the north, called 'barrens,'" which are the home of vast herds of cariboo. The inhabitants, exclusive of a few Europeans, are Esquimaux, who live entirely on the coast, and the Cree Indians, who inhabit the forests. These latter are probably the nearest approach to the original North American red man now existing, as they have little intercourse with the whites and are protected from the demoralization of drunkenness by stringent prohibitory liquor laws. In the summer about 30,000 fishermen are to be found on these coasts. Mr. Holme expresses deep regret at being obliged to turn back when within fifty miles of the Grand Falls, which he believes "in some respects to be the most stupendous falls in the world." The centre of Labrador is a plateau estimated to be nearly 2,500 feet above the sea level, and the waters of a chain of lakes fall, it is conjectured, the greater part of this height at a single leap. They have been seen, and that many years ago, by only two white men.

The Chinese Government is making strenuous exertions to promote tree culture, both with the hope of preventing droughts and the disastrous floods, and to check the wanton destruction of trees by which once fertile tracts are made barren. A proclamation has been issued in the Province of Chi-li, in which Peking is situated, giving "eight directions for tree plantation," in which are minute instructions as to the choice of trees and the methods of planting, and "ten benefits to be derived from the same" —from the sale of timber and fruits, the increase of the rainfall, the purification of the atmosphere, etc., and the furnishing of shade to travellers and families.

—Since English poets left off the habit of writing occasional Latin verses, there has been no instance of such highly artificial work as the character of Pope contributed by Austin Dobson to the current *Scribner's*. The lines are a clever imitation superficially; but if one thinks what Pope would have been capable of, with such a man to dissect as he himself was, Mr. Dobson's amiable epigrams grow vapid. Of course he does not mean to write in Pope's spirit, but with his manner—so much is to be said; yet this is a weak defence. How easy it is to write in Pope's manner, the poetasters who imitated him attest; and really, if one disregards the antiquated printing of these lines, and looks at them without dashes and italics and capitals, they are not much to be preferred to those perishable couplets a hundred years ago. They are no more like Pope than the Latinists were like Horace. Is it possible, too, that the band of bards to which Mr. Dobson belongs will remain for ever in ignorance that their mutual paying of compliments is, to the barbarians of the outer world, an inexpressibly comic trait of the coterie? Since Mr. Stevenson paid his tribute to Mr. Lang as him "of the brindled hair," one thinks they might begin to have an inkling that the Rabelais Club is the place for that sort of amusement. The essay which accompanies these verses is only a tolerable encyclopædia article; it is neither a study of character nor a criticism, and is without even that freshness of turn which is all the subject, thus treated, admits of. The remainder of the number is very excellent as a whole. Mr. Longfellow's paper on the decoration of Greek vases is full of valuable suggestions for the American artists who are interested in this form of ornamentation. The article upon modern explosives is well done, being comprehensive, definite, and interesting, and not too technical. Mr. Stimson's novel—the most notable serial now running—continues its curious intermixture of serious thought and light worldliness. The illustration of the number is especially to be praised.

—The anonymous contributor of the article on "The Anglo-American Copyright Question," in the *Westminster Review* for March, writes in a tone of grievance, due, it seems, to Mr. Brander Matthews's papers concerning "American Authors and British Pirates," published in the *New Princeton Review* for September, 1887, and January, 1888. The writer, after quoting several pages of the examples given by Mr. Matthews of the treatment of American authors by the piratical publishers of England (with no attempt, be it said to his credit, to palliate or excuse the wrongdoing of the latter), and admitting "that an author whose books are pirated, and, it may be, mutilated at the same time, suffers a serious injury," still considers that the hardships complained of are largely exaggerated. He also thinks that the difficulty, as well as the expense, encountered in securing a British copyright for the American author's work is overestimated. "The great majority of authors live in cities and large towns," he argues, "and most of the centres of population in the American Union are in the northern part of it; moreover, railway travelling in the United States is reasonably cheap," and as the stay in Canada need not exceed a few days at no great expense, the conclusion he arrives at is, "that the number of American authors who are debarred from obtaining a British copyright by their inability to bear the cost of doing so, must be very small."

—It is difficult, doubtless, for an Englishman to realize that a trip to the nearest point in Canada from Washington or St. Louis, or any other place as far South, would cost quite as much in time and money as a journey from London to some city in Germany, and would involve more discomfort, with little compensation by the way. We fancy that a proposal to require such a journey upon the part of an English author for each book he might desire to copyright in Germany would not be viewed with complacency. It should not be overlooked, moreover, as it seems to be in this case, that it is not only this expensive and irksome journey which is required of the American author, but that he shall have a reputation sufficiently well established to enable him to secure a publisher for his work in London as well as one in the United States. The possibility of securing some sort of English copyright for his book by going to Canada, and the enjoyment by the American author—together with the other citizens of the United States—of the works of European writers at the low prices made possible by piracy, "far outweigh," says this writer, "any pecuniary loss or literary mutilation he may suffer at the hands of the 'British pirate.'" When the American author, upon bringing his book to a publisher, learns that he must expect the sale of only a limited number of copies, because the latter has already supplied the popular demand by reprinting a similar work (which he had for the taking) by some celebrated English author, he is not likely to find consolation in the fact that he, like other American readers (who might possibly have been *his* readers), may secure a copy of his rival's book at a trifling price. Nor do we think that even the knowledge that he can obtain protection in England for his book will lead him to agree with this writer that "American authors are the most fortunate authors in the world."

—The volume of the Archives of Maryland published before the close of last year covers the period from 1667 to 1689 inclusive. The large gap in the Proceedings of the Council of Maryland has been supplied by documents from the Public Record Office, London, of great value and interest. The regulation of intercourse with the Nanticoke Indians, who were a source both of fear and of annoyance through the border ruffianism of the lower whites, is twice confirmed in this volume by treaties with their "Emperor." In each instance they were bound to deliver up runaway apprentices and slaves. The old habit of "not talking turkey" to the Indian is reflected in the phraseology relating to the treaty of 1687, with its supplementary article, "that if any Indian commits an offence against the English he should be tried by the English law, and if an Englishman commit an offence against an Indian he should be tried by the same law." Noteworthy in 1676 are the somewhat excessive "Queryes about Maryland" of the Lords of the Committee of Trade and Plantations, and the far from categorical replies of Lord Baltimore, in which occurs a curious passage concerning a question already raised in these Archives, viz., the baptism of negroes. Maryland, he says, had been infected with the notion prevailing in other colonies that baptism meant manumission, "to the Dammage of the Masters and Owners as if their said servants were actually Dead." Hence a law was made to encourage baptisms by pointing out that in England formerly villeins got no such benefit as enfranchisement from the rite—with good effect, "all Masters generally since the makeing of this Lawe haveing beene willing to Instruct those kynde of Servants in the ffayth of Christ and to bring them to desyre and receive Baptisme."

—Calvert's answer to the twenty-third and twenty-fourth inquiries was, "that the greatest Obstruction of the Trade of this Provynce is what the late Acts of Parliament made in England for Navigation have occasioned, the removeing of which is not to be expected untill it be for the Interest of England to remove them." He was himself shortly brought up against these Acts in connection with the duty on tobacco, and made to eat humble pie by reinstating as Collector of Customs one Christopher Rousby, who got off to England and lodged complaint against Baltimore, carrying a very high head, and saying of charges of immorality against himself, that "it is a way of writing made easy to his Lo'p by his practise, . . . though his Lo'p have no cause or

ground for the same but hopes that casting much Dirt some might stick to work his ends against us." Rousby went back and was murdered by Col. George Talbot. A sample of the fetters of the Navigation Acts is given on page 447. A good deal of light is thrown upon Claiborne's trading venture and settlement on the contested Isle of Kent, and upon Capt. Josias Fendall's sedition trial; much, too, on the early boundary dispute with William Penn. In connection with depositions favorable to Claiborne, we meet with the name of William Blizard; and still odder is that of Alexander D'hynoyossa, who so far forgot his lineage as to stab "with a knife Mr. Wells in the belly." Historic is the name of Michael Taney, gent., in 1687 high sheriff of Calvert County. As he is indexed by the editors for page 502, we conclude that the "Nich. Taney" of Calvert County therein mentioned is a typographical or clerical error for Michael. We read in 1681 of "Clark of the Councill John Llewellin (who writes shorthand)," and the Fendall trial is a good example of reporting, whoever did it. The antiquarian humor of this volume is not great, but here and there one smiles at a turn of expression like this: "They said they would be att Palmers Island by that tyme corne was halfe legg high"; or this, of a ship surveyed for seaworthiness, and found to have "suffered much wrong by the worms of this Country both in the Keele," etc.

—Among recent American contributions to the promotion of historical study, the 'Brief Institutes of General History,' by Prof. E. B. Andrews of Brown University, deserves especial commendation (Boston: Silver, Rogers & Co.). It is not a text-book in the common sense of the term, but rather a handbook for the teacher or somewhat advanced student. The plan is one that is more familiar to German than to American readers. The book consists of eleven chapters—one introductory, on the nature, science, and philosophy of history, and the ten following on as many periods or general topics; for example, the Old East, the Classical Period, the Mediæval Roman Empire of the West, Renaissance and Reformation, Prussia and the New Empire. Each chapter is furnished with a very judiciously selected bibliography, and each section of the chapters with special references to the best sources of information. These sections consist of text and notes. The text is somewhat similar in character to the German *dictata*, *e. g.*, Droysen's 'Historik,' or, in other words, to the main propositions of a lecture; the notes, on the other hand, comprise much valuable illustrative and statistical matter, such as exact dates, strength of military forces, summaries of noteworthy special investigations on contested points. A companion volume, which we have not seen, is devoted to English and American constitutional history. We feel no hesitation in warmly commending Prof. Andrews's book to teachers and students. It bears on every page the stamp of careful research and vigorous thinking.

—The new interest in the Scandinavian discovery of America has manifested itself in two characteristic books, which are at variance with each other, while both are permeated with the most vagrant sort of an unhistorical spirit. That of Miss Marie A. Brown, which in the present issue bears her own imprint at Boston, and is called 'The Icelandic Discoverers of America,' may be dismissed as the creation of an almost disordered mind, for in its captiousness it obscures the essential elements of the whole question. The other, in its wealth of cartographical adornment and sumptuousness of page, will carry the name of Eben Norton Horsford, as the author of the 'Discovery of America by Northmen,' wherever these adventitious aids can find for it acceptance in the libraries of the world, as seeming to express the results of American scholarship. Unfortunately, the American scholar has nothing to do with this manifestation in his behalf. The question which is dealt with is not a very complex one. Did the Northmen, having passed from Scandinavia to Iceland, thence to Greenland, hesitate to push their adventurous vessels further, and did they accordingly cross Davis's Straits, and pass on down the coasts of North America? There is only an occasional dissenter, among historical students, from the affirmative of this proposition; but when it comes to the identification of localities, to determining where the Northmen picked grapes, where they beached a ship, where they built a booth, and where they buried a companion, the trained student, accustomed to deal with historical evidence, finds the details of the sagas too susceptible of a varied interpretation to feel any confidence in decisive judgment. It is those who make no hesitation at perversion, and ignore everything that does not serve their purpose, who find clearness in obscurity, and decisiveness everywhere. If historical problems are to be settled thus, there is no need of training the judgment. Every historical subject, in some stage of its progress through the ages, passes similar ordeals. Searchers of historical libraries find here and there on their shelves not a few of just such over-confident determinations. Such questions as the Northwestern Passage and the Straits of Anian have always invited this audacious kind of inquiry. Then as now there were over-confident views, and the spending of money in quarto editions. The resulting books are more significant at present in the study of psychology than in the elucidation of the problem to which they were addressed.

—Macmillan & Co. send us two new elementary text-books on Physics. The one, 'Outlines of Natural Philosophy for Schools and General Readers,' is by Prof. Everett of Queen's College, Belfast, the author of the work on 'Units and Physical Constants,' which was first published by the Physical Society of London, and which is indispensable to every teacher of physics. Everything from the pen of so distinguished a physicist as Prof. Everett is worthy of respectful consideration; but as a text-book for beginners, we think some of our American works are superior to the 'Outlines,' and as a general reading-book we should prefer the elementary treatise of the late Prof. Stewart. The book is very handsomely got up, contains more than two hundred illustrations, and contains no mathematical formulæ whatever. The other book is the first volume of an abridgment of the 'Practical Physics' of Stewart and Gee made by the authors. The first two volumes of the latter work were recently reviewed in our columns, and nearly everything said in that review is applicable to the present volume, which, in an abridged and condensed form, covers the same ground, viz., the processes of physical measurement and experiments in electricity and magnetism. Teachers in such educational institutions as possess the necessary apparatus will find here a course of experiments probably quite as extensive as they will desire. There are two or three interesting points about the book. The frontispiece consists of two parallel scales in close proximity, so that they are easily comparable, the one inches and their subdivisions in halves, quarters, and eighths, the other centimetres and their subdivisions in millimetres. As paper contracts slightly with age, such scales cannot be depended upon for absolute accuracy, but when, as in this case, they are both printed on the same leaf, their relations to each other remain the same, and their utility for purposes of comparison remains unaffected by the contraction. Another very interesting point is the representation, by three full-page plates, of the ground plan and fixtures of the physical laboratories of three of the principal English schools, the Manchester and the Hulme grammar schools, and the Blairlodge school at Polmont. These are accompanied by the necessary explanations, and should be of service to such institutions in this country as are so fortunate as to possess the means of adding a laboratory to their other aids to instruction. A third point is a "Price List of Apparatus and Materials" for fitting up a laboratory. The prices in England are, of course, of little use as guides in this country, but the list of articles is of interest to every one engaged in making physical experiments.

THE WAGNER-LISZT CORRESPONDENCE.

Briefwechsel zwischen Wagner und Liszt, 1841-1861. 2 vols. Leipzig: Breitkopf & Härtel. 1887.

It has long been known that Wagner's most intimate and influential friend, before the King of Bavaria extended his patronage to him, was Franz Liszt; but it remained for the publication of the private correspondence between the two composers to reveal the full significance of Liszt's services. Without King Ludwig the Bayreuth Festival could never have been given; but without Liszt's material assistance and spiritual encouragement it is doubtful if the Nibelung Trilogy would ever have been composed. It would be impossible to find, even in the ancient classical era of friendship, an example of more absolute and ardent devotion than in the attachment between Wagner and Liszt. Wagner himself compares it to the intimacy of Goethe and Schiller, in a letter dated 1856: "I have found much to edify me in the Goethe-Schiller correspondence; it put me in mind of our own relations, and suggested the precious results which might spring from them under more favorable conditions." It cannot be said that this correspondence is of such *varied* interest as that of Schiller and Goethe; but within its own sphere it is as fascinating and of as great biographic value as any collection of letters ever published. The letters are arranged according to their dates, each one being followed by its answer, although in not a few cases the answer is absent, having either been lost or suppressed by Wagner's widow, who is supposed to have edited the collection. It is not known whether another volume is to follow. Material for such no doubt exists; for although there was a temporary estrangement between the two great musicians, they subsequently became as intimate as ever.

Wagner's letters are not only more numerous but much longer than Liszt's, making up at least two-thirds of the two volumes. At first they are infrequent and formal; but the "Honored sir" and "Sie" are soon exchanged for the cordial "Dearest friend" and "Du"; and finally it becomes "Dein deinster Liszt." In 1849 Wagner wishes to thank Liszt for being the first conductor who had thought fit to produce his "Tannhäuser," after it had been neglected for four years following its first performance. This friendly deed, he adds, was the more agreeable to him because the intendant of the Dresden theatre had just conducted himself with such insulting insolence towards

him that he had been on the point of giving up a position and an art which subjected him to such indignities. In reply, Liszt gives rapturous expression to his admiration for "Tannhäuser," and adds: "Once for all, count me among your most ardent and devoted admirers; depend upon me, and dispose of my services." And never has a promise been more nobly kept. Liszt does not often dwell in his letters on his personal annoyances and drudgeries, but there is enough to show that his life was not such a bed of roses as it is commonly supposed to have been, and as it doubtless was while he celebrated his triumphs as a pianist in every European capital. But when he assumed the functions of an operatic conductor and composer at Weimar, the petty troubles of public life did not spare him. Even his income was hardly more than sufficient for himself and family. Nevertheless, he was always ready to extend a helping hand to Wagner, who was constantly in want of money and had no one to appeal to but Liszt. Liszt gave him part of his own slender income, and exerted his influence in getting contributions from aristocratic and other patrons of art.

Wagner has been censured for the persistency of his pecuniary appeals to Liszt; but there was really nothing else for him to do, except to give up composing, which Liszt would never have permitted him to do. The circumstances under which Wagner lived must be taken into account. He was a political exile from Germany, where alone he could have made a living by utilizing his accomplishments as a conductor; and the Saxon authorities went so far in their persecution of him as to throw impediments in the way of his going even to Italy or France as late as ten years after his flight. His only source of income was from the sale of his early works to various German opera-houses; but for these he received very small sums—twenty to thirty Louis d'or for each—and the *tantièmes* did not amount to much, as the operas were but rarely performed at first. The very uncertainty of this source of income tormented Wagner. It was, as he complained, too much like a lottery; and the constant worry as to whether he should have anything to eat tomorrow for his wife and himself tended to destroy that mood of happy artistic exaltation in which alone he could compose. The work he was engaged in—the composing of the gigantic Trilogy—was *the most impractical thing he could possibly have done.* It took years and years to complete it, and after it was completed years and years would elapse before its performance would yield any revenue. There is a passage in letter 57 which indicates that it was simply financial embarrassment that compelled him to give up "Siegfried" in 1851, and begin to compose "Tristan," which, being a separate work, could be more readily produced, and might therefore put some money in his purse. Wagner's contemporaries can hardly feel proud when they read that while he was composing "Tristan" he was at one time compelled to pawn his valuables, including his watch, and this ten years after his "Rienzi" had been heard and admired. His frequent depression of spirits in consequence of this wretched state of affairs, and of the slow progress of his works, may be inferred from the fact that there are half-a-dozen letters in which he declares his intention to commit suicide. His one desire, he insists, is "to work, to write operas—that is the only thing I am good for"; and all he asked of the world in return was money enough to defray his household expenses: "I cannot live like a dog, cannot make my bed on straw, and seek pleasure in bad liquor. I must have some appreciation if I am to succeed in the arduous work of creating a new world." "Great heavens, such sums as I might *earn* (!!) in America [whence he had received some offers], people ought to present to me, without asking in return anything except what I am now doing, and which is the best thing I can do."

If these facts are borne in mind, Wagner's constant appeals for pecuniary aid appear in their proper light. He knew very well that managers and publishers would some day reap fortunes from his operas; and there was, therefore, nothing Utopian or impertinent in his demand that they should buy him a house and enable him to secure the leisure for creating the works that were to enrich them. There is nothing "small" or contemptible in such an attitude, but there is something very small and contemptible in the attempts of Dr. Hanslick and other German reviewers because of it to besmirch Wagner's character. It was no one's affair, anyway, but Liszt's, and Liszt was only too happy to do everything in his power for his exiled friend, who was compelled, by the very nature of his profession, to do work from which he could expect no immediate return. "Davison told me the other day," writes Liszt, "that the profits of his recent Berlin season sufficed to buy a villa near Dresden. In comparison, you ought by right to be able to buy all Zürich, besides the seven electorates and the lake, with your scores!" Had it not been for Liszt, even the one regular source of income which Wagner had—the percentage on the receipts from his operas—would have been much smaller. For Liszt was not only the first who produced "Tannhäuser" and "Lohengrin" with a conscientious regard for the composer's intentions ("selon le bon plaisir de l'auteur," as he says), and thereby paved the way for these works at other opera-houses, but he wrote enthusiastic essays on them, and, in the absence of Wagner, made arrangements for having his operas produced in various cities. He was even willing to go to Berlin and superintend the rehearsals of "Tannhäuser"; but, owing to the stupidity of Intendant Hülsen, his services were refused. Wagner fully realized the importance of Liszt's services in these matters. "Without you I should now be completely forgotten," he wrote in 1851.

It was a terrible trial for Wagner not to be able to visit his friend and share in his labors in breaking ground for the new school. For eight years he heard none of his own operas, and one of the most pathetic letters in this collection is one in which he asks Liszt whether it would be advisable for him to come to Weimar in disguise and attend a performance of "Lohengrin." Liszt seriously advised him not to risk it; and all that remained therefore for Wagner was to take part in a musical festival in Switzerland, of which he accepted the direction merely, as he confessed to Liszt, in order to get an opportunity to hear at least a few fragments from "Lohengrin." In another letter he complains that the inability to hear his own operas acted as a damper on his creative impulses, and made it difficult for him to continue at work. One of the chief services of Liszt lay in this, that he sustained his friend's flagging spirits by occasional messages of unbounded admiration, and by playing from Wagner's scores on the few occasions when he was able to visit him. Wagner had little execution as pianist, and it was therefore always a feast to him to have Liszt play his scores in his own inimitable way. Thus, in 1855, he writes regarding the "Walküre": "The completion of this work (the most tragic I have ever composed) will require much labor, and I must seek to recompense myself by means of exalting impressions for the energies I have expended. In this you alone can help me. The idea of going through this work, too, with you is the only compensation I expect from it. I myself am quite unable to do anything with it on the piano in such a way as to get any benefit from it." And in July, 1856, he writes:

"Franz, I have a divine idea! *You must get me an Érard piano!* Write to the widow. Tell her that you visit me every year three (!) times, and that you *must* have a better piano than my dilapidated one. Tell her a hundred thousand fables; say that it is a point of honor for her to have an Érard piano in my house. In short, don't reflect about the matter, but go to work with inspired impudence (*unverschämt genial*)! *I must have an Érard.* If they refuse to give me one as a present, I want to get it on credit, with a yard-long instalment."

In the next letter we see why he was so eager to get the Érard: "Tell Mme. Érard to send me a grand at once. I will pay 500 francs on it every year. No doubts! *I must have it when you visit me!*" It was the eagerness to hear some of his own latest music at least on a good piano, since orchestras were inaccessible to him.

No less encouragement and pleasure than by playing his scores, Liszt gave him by the admiring remarks on his compositions with which he seasoned many of his letters. "Your 'Lohengrin,'" he writes in 1850, "is a sublime work from beginning to end. Many, many passages have pressed tears from my heart." And eight years later: "I cannot tell you how deeply the work affects me every time. When I conducted it the last time, I felt proud of my century for possessing such an artist as you revealed yourself in this work! With 'Lohengrin' the old operatic world comes to an end. The spirit moves on the waters, and there is light." Liszt was the first who had the privilege of seeing the score of "Lohengrin," and to him it is dedicated. The same privilege was accorded him in the case of "Rheingold," "Walküre," and "Tristan." "How I must thank you, dearest, only one, for sending me the scores of 'Rheingold' and 'Walküre.' They exert on me the fabulous attractiveness of the mountain of magnet which irresistibly attracts ships and mariners," he writes in 1856. And two years later: "What a heavenly Christmas gift Härtel has sent me! All the children in the world, with Christmas trees adorned with golden fruits and lovely presents, cannot experience as much joy as I alone derived from your unique 'Tristan. Away with all cares and troubles of the humdrum world! Here is something again to weep over and flare up in enthusiasm. What ravishing magic! What an incredible wealth of beauty in this flaming love potion! What must have been your feelings when you conceived and composed this wonderful work!"

Such rapturous expressions are now the order of the day, but that Liszt wrote them almost forty years ago shows that his genius was great enough to appreciate Wagner's, even before his creations had presented themselves in their engaging instrumental garb. And Liszt had the courage to repeat these rapturous opinions in his published essays, whereby he greatly quickened the growth of Wagner's popularity. The effect which his essay on "Lohengrin" had on Wagner is illustrated in this remarkable extract (I., 122):

"It is difficult to describe to you the impression which at this particular moment your latest act of friendship has made on me! I had again become cold and suspicious regarding myself, and the thought of undertaking a new work of art aroused in me hardly anything but derisive contempt. The artistic misery far and near is so great, my spirits so depressed, that just now the only thing I could do was to laugh at myself when I thought, for instance, of the execution of my 'Siegfried,' and this mood I

transferred to all my work. A few days ago I turned the leaves of my 'Lohengrin' score; it inspired in me positive disgust, and my occasional outbursts of laughter were not of an encouraging nature. Now once more you approached me, and impressed, delighted, and inspired me to such enthusiasm that I was dissolved in tears, and suddenly felt again that there is no pleasure more voluptuous than that of being an artist and creating works of art. It is indescribable, the effect you have produced on me."

After reading Liszt's appreciative essay on the "Flying Dutchman," Wagner writes (1854): "Who has understood me? YOU—and no one else! and who now understands YOU? *I*, and no one else! Be assured of that." And this brings us to the other side of the question. Did Wagner reciprocate Liszt's admiration of his music? An attempt has been made to show that he did not. But if his essay on Liszt's Symphonic Poems did not suffice to contradict this notion, the present letters would completely refute it. Thus, on p. 128, vol. ii., we read:

"In the month of May, so abominable for me, I have not been able to do more than look through your six scores with dimmed vision; but even thus I received the electric shock which the great produces on us, and one thing I know, that you are a wonderful man, to whom I can in no respect find a parallel in art and life. So great an impression did your conceptions and the general outlines of your execution make on me that I was eager to see more from you at once—the three other numbers, 'Faust' and 'Dante.'"

On the next page is a most remarkable analysis of Liszt's musical individuality, which is too long to quote, but which ends with this sentence: "So your orchestral compositions may be regarded as a monumental embodiment of your personal art, and herein they are so new and incomparable that the critics will require a long time to find out what to make of them." In a postscript he adds:

"But how terribly beautiful your 'Mazeppa' is: I was quite out of breath when I had read it through the first time! I felt sorry, too, for the poor horse: how terrible is nature and the world!" Again: "Every day I read one or the other of your scores, very much as I should read a poem, easily and without impediment. Then I feel every time as if I had dived into a crystalline depth, there to be alone by myself, leaving all the world behind, and living my own real life for an hour. Refreshed and invigorated, I then reappear on the surface, to long for your personal presence. Yes, my friend, *you have the power! Du kannst es!*" And once more: "The sonata is beautiful beyond all conception; grand, lovely, deep, and noble—sublime like yourself. I am most profoundly moved by it, and all my London *misère* is forgotten."

It is by no means as well known as it should be that Liszt was one of the most brilliant men of letters of his time. His musical essays, which have only recently been collected into a complete edition, contain a marvellous wealth of ideas and suggestions, and display a most exuberant imagination and mastery of style. Moreover, hardly any writer on music had like himself what is considered the highest critical gift—the art of reproducing the emotions of the art work discussed by him. To this Wagner alludes in one of his letters (i, 166): "Your style must be incomprehensible to one who does not understand music; but the way in which you can reproduce in apt words the self-same emotions which music alone can excite in us, fills with delight every one who has had those feelings, but could find no words for them!" The perusal of Liszt's essay on "Tannhäuser" awoke again in Wagner a wish which he had previously expressed, that Liszt might compose poems for his own musical purposes: "You have all the endowments, as well as any one! Write your poems in French or Italian; in that very sphere you cannot but create something entirely new, bring about a great revolution." Unfortunately, Liszt never followed this advice, yet posterity will rank him not only among the greatest composers, but among the foremost literary men of his time.

We have noted a hundred other interesting passages in these letters, but our space is exhausted. Of special interest is Wagner's account of his experiences in London and Paris, and of inestimable importance the directions he gave Liszt regarding the proper performance of "Lohengrin," etc.—directions which every conductor and singer should read. English readers will soon have an opportunity of perusing the Wagner-Liszt correspondence in a translation on which Dr. F. Hueffer is at work.

AGRICULTURE AND PRICES IN ENGLAND.

A History of Agriculture and Prices in England, from the year after the Oxford Parliament to the Commencement of the Continental War (1793). By James E. Thorold Rogers. Vols. V and VI (1583-1702). Oxford: Clarendon Press; New York: Macmillan. 1887.

IT is at once an easy and a pleasant task to bring to the notice of the reading public a new book from the pen of Professor Rogers. The reputation of the author as a careful investigator is so well established by what he has already done, that either praise or criticism seems out of place on the part of one who reviews his writings; the reviewer, therefore, may content himself with a simple statement of what is to be found in these new volumes.

But at the outset it may be well to say a word respecting the work as a whole, of which the two volumes lying before us form a part. It is now more than a quarter of a century since Professor Rogers began to collect data for a history of agriculture and prices in England. "Such labors as I have undertaken," he says in the preface to his first volume, "are essential to that economical interpretation of history which, I venture on asserting, is as important an aid towards the comprehension of the past as the study of legal antiquities, of diplomatic intrigues, or of military campaigns." The work when completed will comprise eight volumes, and present an authoritative history of English prices from 1259 to 1793. Why, it may be asked, should the investigation be arrested with the year 1793? That, we reply, is the date at which the monumental work of Thomas Tooke begins, which, together with the two volumes added by Mr. Newmarch, brings the history of prices down to 1856. We may in this manner come to appreciate the importance and scope of Professor Rogers's work. The economic literature of no other people contains a complete history of prices from the thirteenth century to the present time, and, according to our author, "there is no European country, except England, the archives of which could supply satisfactory evidences of prices." It is impossible, in these days when economic study is turning largely in the direction of economic history, to overestimate the importance of so complete a record of prices covering six centuries of time.

The fifth and sixth volumes of this work, which have just appeared, trace the industrial development of England from the middle of Elizabeth's reign to the beginning of the reign of Queen Anne. This is perhaps the most important period in the growth of the English nation—at least no period has received greater attention at the hands of historians. And yet, notwithstanding all that has been written, the industrial forces which gave character to the seventeenth century have never been adequately portrayed. Nor can we say that this is accomplished by Professor Rogers. He has not attempted to give a picture of English industrial life, but rather to supply the material from which such a picture may be drawn. There is little of interest in the mass of facts presented in these volumes, except for the student who sees how they fit into the development of the English people; but for such a one the labor of reading becomes the source of keen intellectual enjoyment. According to our author, there are seven classes of important economic events which make their appearance during the one hundred and twenty years covered by his investigation; and we may perhaps most perfectly get at the spirit and aim of his work if we notice these events one after the other as he himself has presented them.

The first and most obvious of the events in question is the effect which the influx of the precious metals from the New World had on prices. There is no period, says our author, which throws more light on the general theory of prices than the one considered in these volumes. To a certain extent this is true of all Europe, but England shows in a peculiar manner the relation existing between industries and an increasing circulating medium; for it must be remembered that she possessed no gold-bearing colonies, and was in consequence obliged to secure her quota of gold and silver by means of trade with other countries. It was through the avenue of trade, and not by direct importation, that money came into England; and it was through trade, also, and not (as in the case of Spain) by means of military disbursements, that the money imported was put into circulation. On this account England presents an especially fruitful field for the study of the influence of money on industries.

There is, in this connection, also another fact of interest to the economist, which, though not stated by our author, is yet illustrated by the figures he presents. The student of history finds it necessary to explain why England in the seventeenth century developed her industries more rapidly than any other of the nations of Europe. There are, of course, many causes which worked in this direction, but one factor of great importance seems to have been overlooked. As we have said, England had no gold-bearing colonies. This was the occasion of regret on the part of the English people, and for the time it did place them at a disadvantage when compared with Spain. And yet this fact, so deeply deplored, was more potent in the development of England's commercial greatness than any other one fact which may be mentioned. Since England could not obtain the precious metals directly, she was obliged to obtain them indirectly by building up her home industries. But this is not the most significant feature of the situation. During the seventeenth century English merchants had a continual incentive to extend their operations. The market in which their goods were sold was directly influenced by the gold imported from the mines; while the home market in which their goods were bought could only be affected by the gold which the merchants brought home as the result of successful trade. On this account, prices on the English market were always a step behind prices on the markets of Europe where English goods were taken. There was thus an incentive offered for the constant expansion of commerce and industry.

The second fact of interest to industrial history pertains to the rise of rents on arable land. It will be remembered that, by the middle of the sixteenth century, customary rentals of feudal times had ceased to exert a control-

ling influence; and our author tells us that "very early in the seventeenth century the rent of arable land had generally increased nine-fold over the old rent, and in many cases even twenty-five fold over customary rent at an earlier period." This remarkable rise in rent is traceable to two causes. The rise in the price of agricultural produce permitted farmers to pay higher money rents, while the general improvement in methods of farming made it possible for them to give a larger proportion of their produce to the landlords. It was not, however, till the eighteenth century that agricultural improvements exerted a decided and independent influence on rentals. But we are not on this account to conclude that agriculture in the seventeenth century was at a low stage. From the accounts given of it by contemporary writers, we learn that it was varied and productive. The principal authorities upon which Professor Rogers relies for information respecting agriculture are Norden, Markham, Vaughn, Platts, Hartlib, and Worlidge. We are a little surprised that he makes no mention of 'Best's Farming Book,' published by the Surtees Society, which is a most interesting account of rural economy in Yorkshire in 1641. It certainly contains some facts which our author has not revealed, though perhaps none necessary to the end which he has in view.

We cannot speak in detail of all the points brought out in these volumes which are pertinent to the development of English industrial society, and will therefore content ourselves with mentioning the next four without comment. Population increased rapidly despite the epidemics which ravaged the towns. The maritime adventures, which at first were but "little above the level of piracy," developed into a well-regulated system of trade and commerce. Another interesting feature of this period is found in the mass of social legislation which a class government imposed upon the people of England. "Many of the consequences which are derived from this legislation," says Professor Rogers, "influence English social and economical life at the present time, and are inducing economical problems upon us of no common greatness and difficulty. The seventeenth century is the beginning of modern economical history." The development of the joint-stock principle in commerce and manufactures is regarded as of sufficient importance to warrant special mention. Among the most successful of the institutions established is the Bank of England, which, it is asserted, gave steadiness to the machinery of representative government from the day of its organization.

But our chief interest in a treatise upon industrial history must centre in the new facts which it discloses respecting the labor problem. We cannot, of course, go very far in presenting the figures which show the movements in wages of laborers and the cost of living in the seventeenth century, but we can state in a word the conclusions of the author. The great economical fact to which he calls our attention is "the success of the conspiracy, baffled for more than two centuries, against English laborers. This is indeed," he remarks, "the saddest part of the retrospect. I have attempted in an earlier volume, as in this, to narrate, not without indignation perhaps, but with no conscious unfairness, the early history of the strife between employers and workmen, and the commencement of that crisis in the struggle during which the laborer was hopelessly beaten." The conspiracy to which Professor Rogers refers consists in that legislation by which it was endeavored to curtail the freedom of the English workman, while professing at the same time to guarantee him physical support. He refers to the Elizabethan Labor Code, to the Poor Law passed as a complement to the Labor Code, and to the Act of Settlement. The first of these laws gave to the justices of the peace the right of fixing wages and of punishing deviations from the wages fixed; the Poor Law authorized enforced labor; while the settlement acts prohibited a workman from going out of his own parish in search of work. Now, during the period we are considering, it would have been difficult under the most favorable legal conditions for the workingmen to have made headway against the increased cost of living. Prices had risen seven-fold. The average price of wheat from 1260 to 1542 was 5s. 11¼d. per quarter; the average price in the seventeenth century was 41s. per quarter. But when, in addition to the burden of rapidly rising prices, the law gave to members of the employing class the right to prohibit migrations from a certain parish, to force men to work under threat of legal punishment, and to fix legal wages, the condition of the laborers became utterly hopeless. Whatever may have been the intention of those who framed these laws, it must be admitted that they entailed evils as great as would have been entailed by a deliberate conspiracy against laborers.

It is in connection with this discussion that Professor Rogers pays a loving tribute to John Stuart Mill, while at the same time criticising his method of approach to economic questions. And so clearly does he put the point at issue between those who hold to the philosophic and those who have adopted the historical method of investigating industrial problems, that we cannot refrain from quoting this paragraph in full:

"I know of no person whose friendship I valued more than that of Mill. I greatly respected his candor; I admired his translucent utterances. No man ever gave one a clearer conception of what he meant at the moment. He was so earnest and so convinced, so gentle and so modest, that for a time one felt that he must be right. But few writers, I am sure, have been so much in the wrong, and few writers have done so much mischief as he. The evil came from want of knowledge. His estimate of economic causes was entirely autobiographical. He mistook his own impressions of the social state for the causes which had brought them about. He believed (for he told me so, and he never said what he did not believe) that every moral gift and every intellectual power could be imparted by education. The beggary, the misery, the improvidence, the recklessness of the English laborer were in his mind due to immediately preventable causes. Had he studied economical history, and given their due weight to that vast series of causes which made the English peasant what he is, I am convinced that his indignation would have been directed against other agencies than those which he collected and criticised. But, unfortunately, he wrote on social conditions without a preparatory training, even in those facts which had been published."

We cannot bring our notice of this work to a close without tendering to Professor Rogers our congratulations for the new honor which the University of Oxford has conferred upon him, in electing him to the chair of political economy left vacant by the death of Professor Bonamy Price.

EDUCATION.

Industrial Instruction. By Robert Seidel. Translated by Margaret K. Smith. 12mo, pp. 160. Boston: D. C. Heath & Co. 1887.

Education of Man. By Friedrich Froebel. Translated by W. N. Hailmann. 12mo, pp. 332. New York: D. Appleton & Co. 1887.

The Ruling Principle of Method Applied to Education. By Antonio Rosmini Serbati. Translated by Mrs. William Grey. 12mo, pp. 363. Boston: D. C. Heath & Co. 1887.

The Elements of Psychology. By David J. Hill, LL.D. 12mo, pp. 419. New York: Sheldon & Co. 1888.

THE catalogue of the "Industrial Education Association" in New York city, apparently showing an attendance of 686 students, furnishes an opportunity to point out a significant tendency in modern education. A great development of industrial life has taken the place of that which characterized mediæval civilization, and the immense growth of the world's population has modified the ratio between population and the means for subsistence. These facts, or the forces which they set free, are revolutionizing our educational system. Time was when the pure sciences were the chief pabulum of instruction. But experience shows them to be unproductive, and the chief want of the present, with its developed industries, depending as much upon manual as upon mental skill, is a training that will be practical. The several books under notice represent the various stages of development towards this view. We begin with the one which exclusively concerns the industrial.

Seidel has the courage to predict that "the future in the state, as well as in pedagogy, belongs to labor." Socialists may welcome this view, but it is further off from realization than enthusiasts imagine, important as the author's position may be. He is thoroughly *en rapport* with the new tendencies, and has no purely ideal ends to defend. It is interesting and important to notice his point of departure, as it shows why education cannot proceed entirely in the old grooves. He points out the futility of that system of industrial education which was designed to protect the small trades, because it was clear that the larger and machine industries were certain to supplant the others; and hence industrial education, if it is to be given at all, must be in the channels which present economical conditions lay down for us. Now, the influence exerted by industry upon a large scale is simply an actual fact, which has to be met and reckoned with. It changes old conditions, and necessitates, therefore, a change of method to meet the exigencies thus created. Education has to be extended from the liberal to the practical.

Seidel's work marks the extreme tendency of which we speak, although it was not written to defend such a position against the claims of speculative studies. Froebel's is a step removed from this, and, although aiming at practical methods, is more in sympathy with the intellectual aims of past ages. It rather shows the theory which characterizes the mental transition from the intellectual to the industrial. It is conceived in opposition to the views of Pestalozzi—at least apparently, although examination shows it in reality the same. Pestalozzi based his views of education upon the mere idea of knowledge; Froebel upon that of self-activity and the realization of personal aims. Here he might have shown his sympathy with manual employments, with a system of education having social and practical bearings. But no. All the self-activity which he has in mind is born of Hegelianism, and means, in the last analysis, that the individual child or man should be trained to realize in himself "the treasures of science—the wisdom of the race." This is only to return to the position from which he started. The method which he proposes is admirable, and may be called a scientific foundation of his kindergarten system. It is, to limit the matter of instruction to the character of experience and intelligence which receives

it. In this way all dogmatic doctrines and creeds are reserved for maturity. Although, in many respects, mystical in the aims it would realize, and moulded in the spirit of a philosophy which is no longer in the ascendant, the work has most valuable suggestions for every instructor of the young. Its historical value is considerable, but it can be only transitional in its influence.

Rosmini's work is more practical. It endeavors to develop methods more than ends, and this single fact brings him into closer contact with modern life. It is another step of removal from the view proposing purely intellectual ends in education, although there is no advocacy of anything like industrial training, except in the most general way. Rosmini was a contemporary of Froebel, but worked out his system in entire independence of that author. There are many points of resemblance between their methods, but one of essential difference between them which accrues to the favor of Froebel, in spite of his mysticism. Rosmini was a Roman priest, and his work was sanctioned by his Church; Froebel was a product of Protestant theology and philosophy. This fact marks the essential difference between their views in regard to the matter of what they would teach children, especially in religion. "Rosmini, as could not be otherwise, based the practical religious education of the child on instruction in the dogmas and formularies of the Church. Froebel, on the other hand, with a consistency impossible to his great contemporary, refused to depart in religious instruction from the fundamental principle of both, that children should never learn words representing ideas which their minds were incapable of conceiving." This is important to notice because it clearly defines a movement in modern thought of which even its own advocates do not realize the tendencies and consequences. That Rosmini did not remark it while consciously developing his system, can only be explained by the intellectual and political power of Papacy, which could so determine and control a man's opinions that they were very little exposed to revision. Certainly he did not realize that his whole method undermined that of instruction by authority. He would begin the child's education by using the simplest concrete objects to interest curiosity and to employ the child's own experience for producing ideas and conviction, and then proceed to the more intellectual and complex conceptions of knowledge as the child's own spontaneous development demands. This is the whole of his method in a nutshell, and it is unquestionably the correct one. But it involves a revolution in educational methods and matter of which few are aware. Of course, it is almost universally adopted in the schools, but not as a method of domestic education. When it is adopted everywhere, its effects will be seen. The book shows the influence of psychology in determining all methods of pedagogy, and moves towards the practical spirit of modern times in that it has no speculative problems to solve, and no special intellectual ends like those of philosophy to condition the mode of education it defends.

The last book under our notice, although a treatise on psychology, is of that kind which belongs to pedagogical work rather than to scientific and philosophic study. It has no merit whatever as science or philosophy. The manner in which it was written precluded all this. It is a kind of encyclopædia in little of all questions in speculation; and such a compilation of opinions and quotations, with the most astonishing prolixity of analysis, has seldom been offered to educators. The attempt is to bring the student into contact with all the problems of science, philosophy, and religion within the compass of a few hundred pages, as if he would never meet with another opportunity to reflect upon them. From such a book the student can arise with no other conception than that he has seen a great many things. There are no less than 223 quotations and references in 373 pages of print, nearly all of them quotations. The book states the views of, and quotes from, 140 different philosophers, and mentions about 30 others for the purposes of illustration. The analysis represents 460 different topics, besides general headings. It will be evident from this that the work violates every principle of rational education which provides for mental discipline and the mastery of a few fundamental principles for guides in later development. Moreover, the smattering given often relates to subjects which do not need to be approached by the student at all. For instance, what do we want to do with scholastic discussions of "Nominalism," "Realism," and "Conceptualism" in high schools, where this book will be used, and where, perhaps, the subject ought not to be taught? So also with "Monism," "Pantheism," etc. It would be better to omit psychology entirely than to teach it in this way. The work is hardly out of scholastic methods, and, both in respect to this and to its matter, it is the furthest remove from the practical tendency we have noted of all the books under our consideration. It is much more suited for sale than for pedagogy, although no wide-awake teacher will be deceived by it.

The Campaign in Virginia, 1781. An exact reprint of six rare pamphlets on the Clinton-Cornwallis controversy, with unpublished MS. notes by Sir Henry Clinton. Edited by Benjamin Franklin Stevens. London: Henry Stevens & Son. 1888. In 2 vols., 8vo.

THIS work is the most important contribution ever made on this particular part of our Revolutionary history, and the fullest elucidation ever made from the British side of any campaign in the same war. Five of these tracts have been known to students before; but the last of the series, not earlier recognized, is now added to them, as well as very numerous notes made by Clinton on the margins of all of them. These annotated copies were sold a few years since, when Clinton's library came upon the market in London, and were bought for the Department of State in Washington. The tracts gave the illustrative correspondence of the principal actors, but not in full, and all these letters (extended so as to be full transcripts of the originals, which were sought in their repositories) are now grouped together after the tracts. To these are added elucidatory extracts from the Lords' journals, the preface of the French version of some of the correspondence, and a list of about 3,500 other documents illustrating the relations of Clinton and Cornwallis at this time, with memoranda of their depositories and of the places where they are printed.

The new material consists mainly of the comments and corrections of Clinton, which are added to the texts; and the chief editorial function has been to collate the texts and these notes—for Clinton duplicated them several times—and mark the variations. This has been done with a precision almost unprecedented in similar work, and one has a feeling that the attending references are almost overdone, for it is not discoverable that any considerable part of this conscientious labor has really added to the scope of the work by placing many essential variations in conjunction. It will pass, however, for a sample of extreme caution and precision, which puts these two volumes at once into a category of editing almost unique in such material, and such as is usually confined to textual variation in philological matters where an importance clings to minute differences. Mr. Stevens in an introduction gives all necessary preparatory information; and he closes the book with an index equally minute, and which he makes also the vehicle of biographical information. The defect of the book as a monographic treatment of the campaign is the unavoidable one of the absence of all later corresponding comment by Cornwallis, so that Clinton has an unfair advantage in stating his case.

Such is the book as a contribution to historical literature; but most American historical scholars will regard it as an earnest of the kind of labor to be expected upon the work of indexing or printing the mass of European documents, illustrating our history from 1763 to 1783, and especially elucidating the Peace of Paris, which Mr. Stevens has been for many years collecting from the private and public European archives, and which he has been asking the American Government for several years past to accept at a price and to publish. If the present book is a fair sample of the editorial care which has been bestowed upon this other garnered material—and one would judge it to be necessarily so—the historical scholar may feel satisfied that the larger work will be edited by Mr. Stevens with a precision that will answer, and perhaps more than answer, any historical inquirer. Painstaking in this way is costly, however, and may perhaps swell the charge to an extent that will block the hoped-for undertaking. It is a question if in non-essentials it is worth while to pursue such a minute collation, although the method is probably the best way of establishing a conviction of trustworthiness. The student would certainly rather have the papers with reasonable precision than fail because of such a burden of nicety to get them at all. It seems a pity that so much material as Mr. Stevens has gathered should not in some way be made available to our historical workers, and that with expedition.

Strongbow's Conquest of Ireland, 1166-1188. By Francis P. Barnard, M.A. G. P. Putnam's Sons.

WE have already made mention of this admirable little book in connection with the series of primers called "English History from Contemporary Writers." In it are brought together translations of all the main extracts from contemporary or supposed contemporary writers or annalists, British and Irish, relating to Strongbow's invasion of Ireland; and we find appendices—the descendants of Nesta, list of the adventurers who joined Strongbow, the Irish and Norse chieftains who appear during the war, notes on the life of Giraldus, and other information—invaluable to the students. We regret that, as in some other books of a like character lately published, the illustrations do not come up to the letterpress. Where so much care and expense has otherwise been gone to to produce a standard educational work, it is shortsighted policy not to spend a few more dollars upon the woodcuts.

We have seldom had brought before us with more painful vividness the incidents of the Anglo-Norman *invasion* of Ireland (conquest there was not for 400 years later). We see in all their nakedness the rapacity of the invaders, the weakness and divisions of the natives,

duplicity and faithlessness on both sides. We are told by one of the English chroniclers on page 8: "In proportion as the realm [of Ireland] was [had been] free from external aggression, so much the more miserably were the natives commonly engaged in tearing the bowels of their fatherland by their intestine feuds." Whatever may have been the glories of Ireland in previous times, this was undoubtedly true regarding the condition of the country in 1169. Had Strongbow and his followers brought about a settled state of things, had they laid the foundations of a well-ordered state, none would have more cause to bless them than Irishmen of the present day. As it was, they but added to the confusion and unsettlement; they were actuated by principles and methods carried on to the present day; they would neither rule wisely and well nor let the Irish themselves evolve a settled government. We trust no one will read the book without looking over the preface, in which full allowance is sought for the extravagances, "sometimes sheer buffoonery," "credulity," "malignity," and other faults of Giraldus Cambrensis, whose writings are principally drawn upon. The extent to which the invasion was a family affair can only be understood by study of the table of the descendants of the Princess Nesta, which is perhaps as correct and as carefully compiled as another list of her descendants we have seen.

BOOKS OF THE WEEK.

Manners: a Handbook of Social Customs. Cassell & Co. 50 cents.

Fine Arts.

SOCIETY OF AMERICAN ARTISTS.—II.

"Tulip Culture," No. 71, by George Hitchcock, is a picture which attracted a great deal of attention at the Salon of 1887, and the estimation in which it was held by artists in Paris is shown by the fact that the Salon jury awarded it a *mention honorable*. It is one of those pictures which please artists and laymen alike, for to the former it appeals by its frank and honest painting and its excellent qualities of light and air, while the latter are moved to admiration by the novel character of the subject, and find pleasure in looking at a picture in which nature seems so faithfully portrayed. It is a charming picture, of which it is sufficient to say here that it is thoroughly good work, and that in it Mr. Hitchcock has been eminently successful in accomplishing a task of considerable difficulty in the management of color. It is unfortunate that it is placed in one corner of the gallery, when it would have appeared to so much better advantage in the middle of the room, in the fullest light it would be possible to get on the canvas.

Such a place is happily given to the large picture "In Summer," No. 4, by Frank W. Benson. This, too, is an out-of-doors subject, a portrait of a young lady in a white dress, who is seen sitting in the shade on a lawn, which in the middle distance is flooded with sunlight, and extends to a background of trees, and houses, and garden walls beyond. It is very simply painted—too simply at times, for it amounts to positive thinness in certain passages—but it is a remarkably faithful study of values, it is clean and fresh in color, and very good in ensemble. It is to be especially noted as the work of a young Boston artist who has not exhibited before in New York, and who may be safely set down as a painter of whom much may be expected.

Something of value in painting of the nude is generally to be seen at the Society exhibitions, and this year is no exception to the rule. Besides Mr. Kenyon Cox's "Indian Summer," which has been mentioned in another article, here are a charming full-length figure of a young girl, "'Neath Apple Boughs," No. 82, by Will H. Low, a refined and delicate piece of work; another in a half-recumbent pose, "Offering to Aphrodite," No. 39, by Herbert Denman, a well-drawn and agreeably colored female figure painted with much nicety of observation and placed in a well-balanced composition; and a small picture, with a figure of a woman reclining, and a landscape setting, "Ariadne," No. 50, by Wyatt Eaton, which, without having the distinctness of line and fresh quality of color which characterize the first-named works, has an individuality of its own, and is especially to be commended for excellent painting of the flesh in shadow. With these should be mentioned the half-nude figure, "Chloë," No. 128, by Henry O. Walker, in which the luminous tones of the flesh are well contrasted with the white drapery which partly envelops the figure, and a quiet scheme of color is well sustained throughout.

Mr. Maynard's majestic figure, "Civilization," No. 84, which occupies the centre of one of the end walls of the gallery, effective in its well-managed arrangement of white in the drapery and reddish tones in the marble wall, and Mr. Dewing's "Allegorical Figure," No. 41, dignified in style and painted in a harmony of greens and pale grays, are decorative works of distinctive character and individual merit. Mr. Tiffany's rather commonplace arrangement of reds and blues in the large decoration "In Memoriam," No. 113, and Mr. Low's design for a window, "Madonna della Pratellini," No. 81, a conventional composition, but of decided charm of quiet color, are two other works of the same class, and perhaps with these may fittingly be mentioned Mr. Blashfield's excellent "Interior of St. Mark's, Venice," No. 6, a finely colored canvas, and, as a study, remarkable for truth of observation.

"A Milkmaid," No. 80, by Chester Loomis, is a picture of a Normandy peasant girl riding on a donkey with large metal milk cans slung over his back on each side of her, and is noticeable for clever painting and truth of local color. The figure is charming, and the landscape, with its foreground of grass and herbage and its luminous sky with white clouds, is broadly and sufficiently painted. "Finding a Pose," No. 130, by J. Louis Webb, is a studio interior with two figures, those of the painter seated in the foreground, and the model, a girl in Greek costume of white, who essays a pose at the further end of the room, where some marble busts, a pair of steps, palms and garlands, and other accessories are arranged. The painting of stuffs is notably good, and the picture as a whole has its greatest merit in its appearance of atmosphere and in the rendering of values. It is, moreover, well composed, and escapes the commonplace in the treatment of a somewhat trite subject. Mr. Shirlaw exhibits two pictures, one, "The Sketch Book," No. 105, a small three-quarter-length figure of a young woman with a book in her hands, which is remarkable for mellowness of tone such as distinguishes some of the old Dutch works; the other, "Westward," No. 106, which is a landscape composition with a traveller's wagon and figures of men and horses in the foreground, treated, like the first, rather for the effect of tone than for absolute reality.

In landscape there is, as usual, an excellent showing. Mr. Tryon is seen at his best in a small picture, "December in Connecticut," No. 117, in which a stretch of country, with hills and clumps of trees and stone fences, lying under a wintry sky, is painted in subdued color; and he is further represented by a large work, possessing the charm of a twilight effect, with the fading glow of the setting sun, whose last rays gild the tops of some houses on a hill in the middle distance, "October Evening," No. 115, and by an effective and finely toned "Moonrise," No. 116. "Late Afternoon at Wakefield, R. I.," No. 125, by R. W. Van Boskerck, an effect of sunlight on a meadow, with haystacks in the distance, is realistic in effect without being forced, and is a soundly painted landscape. "Windmills," No. 118, by John H. Twachtman, is a picture, presumably of a Dutch motive, in which there are excellent qualities of line in the drawing of the ground, and the sky is luminous and delicate in color, although the ensemble gives rather the effect of

a decoration in flat tones than that of the enveloping quality of atmosphere. Mr. Twachtman exhibits other landscape studies also, one of which in particular, "Church at Arques," No. 124, is a charming bit of delicate color and is full of light and air. "Evening," No. 75, by H. Bolton Jones, a small picture of a winter landscape, tender in color and delightful in sentiment; "Foggy Day on the Sands," No. 74, by Francis C. Jones, a delicately toned and truthfully observed effect of misty atmosphere; "Landscape," No. 46, by C. H. Eaton, a handsome composition, with large masses of dark foliage and effective notes of color; "Landscape—Cape Ann," No. 92, by Charles A. Platt, a cleverly painted piece of plain and sky, with floating clouds; "Late Afternoon," No. 31, by Bruce Crane; "November Gloom," No. 87, by J. Francis Murphy; "The Red Oak," No. 90, by Walter Palmer; and "Spring," No. 61, by Edward Gay—are all works by well-known painters of landscape. With these are pictures deserving of mention by Butler Harrison, R. A. Eichelberger, C. W. Eaton, F. W. Kost, Charles Melville Dewey, K. I. Langdon, Arthur Hoeber, and Stanley Middleton. "Moonlight," No. 7, by George H. Bogert, is good in effect and excellent in tone. "Evening in Fontainebleau Forest," No. 57, by Ben Foster, is a wood interior, with a sunset sky seen through the trees, which, in spite of being somewhat blackish in tone, is atmospheric and complete in general effect. "Moorland—Cape Ann," No. 38, by Joseph De Camp, is a strongly painted effect of sunlight on rocky ground near the sea-coast, which is exceedingly realistic, but is without much quality of color. "In the Fields," No. 55, by B. R. Fitz, is a landscape with some figures of peasant women at work, painted with especial regard to securing an impression of atmosphere, which is given somewhat at the expense of the look of reality to be obtained by the rendering of exact values and color notes of out-of-door effects. Mr. Wiggins, in "Early Evening Among the Sand Dunes," No. 135, shows a group of cattle standing in the broad shadow of a hill behind which the sun has set, and Mr. Thomas Allen in "Thoroughbreds," No. 1, has painted the heads of four Jersey calves, with a background of green foliage, in his usual clever manner.

One of the *clous* of the exhibition, and certainly one of the best pictures that have ever been sent to New York by an American artist abroad, is "Bay of St. Ives at Evening," No. 107. The painter of this picture, Mr. Edward E. Simmons, has been best known by his figure subjects, and as a painter of Brittany fisher folk has been favorably noticed in Paris and at home for a number of years. Like Mr. Alexander Harrison, whose reputation was first made in like manner, but who is perhaps best known in America as the painter of that beautiful picture of moonrise on the sea, "La Crépuscule," Mr. Simmons has ventured out of the beaten track, and has set for himself a simpler but in some ways a more difficult task in essaying to paint an effect of early evening light on sea and shore with no element of interest outside of what may be found in the placid calm of nature. The composition of the "Bay of St. Ives" consists of a wide expanse of the waters of the bay in the foreground, stretching away to a tongue of land which juts out from the right at the high horizon line near the top of the picture, and a strip of sky above with low-lying clouds, through which the rising moon is peeping. It is neither too late for the sun's light to be entirely lost in the shadows of night, nor is it too early for the moon's rays to gild the edge of the clouds with silvery brightness. The effect is that of the pale violet hues of the long summer twilight. In his treatment of this simple but poetic motive, Mr. Simmons has brought to bear all the resources of his art, and his picture is as truthful as it is artistic. It is a beautiful work, and such as cannot be well described in words. Its full charm can only be felt when one has seen it, and will prove most lasting when one has seen it again and again.

Henry Holt & Co.

HAVE READY:

OUR NATIVE FERNS,

and Their Allies. By L. M. Underwood, Professor in Syracuse University. Third Edition, revised. An introduction to the study of Ferns and a manual for the easy determination of our species. 12mo, $1.25.

GEN. HUGH EWING'S

A CASTLE IN THE AIR.

A novel. By Gen. Hugh Ewing, ex-Minister to The Hague. Cloth, $1.00. Paper, 30 cts.

NOW READY:

The Story of New York.

By Elbridge S. Brooks. 8vo, fully illustrated, $1.50.

This initial volume in the notable series of THE STORY OF THE STATES should be read not only by every New Yorker, but by every American.

Proceeding upon a somewhat novel plan of imparting historical information, it tells the story of the Empire State in vivid, picturesque, and entertaining narrative. It throws against a strong historical background the story of a typical Knickerbocker family, and the record of their varying fortunes is alike the story of the great State of New York and of its cosmopolitan people.

NEW BOOKS.

ADELAIDE RISTORI.

STUDIES AND MEMOIRS. An Autobiography. (Famous Women Series.) One volume. 16mo. Cloth. Price $1.00.

This is the eighteenth volume of this Series, and is referred to as follows by the *Book Buyer:*

"Mme. Adelaide Ristori's autobiography, to be published in the 'Famous Women' Series, is also sure to attract attention. The idea of asking a person to write an autobiography for a 'Famous' series of any sort is rather droll; but Mme. Ristori has reached an age when she may be supposed to be able to look back upon the brilliant triumphs of her youth in a somewhat dispassionate and impersonal manner."

SANDRA BELLONI.

By GEORGE MEREDITH. This is the second volume in the Author's Popular Edition of Meredith's Novels. 16mo. Cloth. Price $1.50.

"Messrs. Roberts Brothers have begun the publication of a popular edition of 'George Meredith's Works.' Each novel will be complete in one volume. 'The Ordeal of Richard Feverel' has already appeared. It is printed in clear open type, on excellent paper, and is in every way desirable for general reading. The price at which this edition is offered can scarcely fail to enlarge the acquaintance of the public with this the greatest living master of fiction, who has not excited that interest in this country to which his genius entitles him. Those who have not yet made themselves familiar with Meredith's novels have a pleasure of the highest order in store for them."—*Saturday Eve. Gazette, Boston.*

To be found at all the bookstores. Mailed, postpaid, on receipt of price by the publishers.

The Nation.

NEW YORK, THURSDAY, MAY 10, 1888.

The Week.

THE difference in the appearance of the two great parties as they approach their National Conventions is ominous for the Republicans. The Democrats in one State after another are falling into line so unanimously and solidly behind Cleveland, that there is now scarcely a probability of there being any other candidate's name before the Convention. The President is likely to receive every vote on the first ballot. The Republicans, on the other hand, are not only divided into sections and groups in favor of half-a-dozen or more candidates, but they are devoting themselves mainly to the question of whether or not their leading candidate was honest when he intimated that he did not wish the nomination. The longer this astonishing discussion goes on, the greater becomes the demoralization of the party. At present, so many party newspapers and leaders are committed against Mr. Blaine's nomination as inviting inevitable defeat, and so many of Mr. Blaine's supporters are so incensed against them for expressing that opinion, that the whole party is more in a condition for a family fight than for a convention. Then, too, the strongest men in the party cannot be nominated, because they are hateful to the Blaine faction, and are certain to be knifed in the Convention in case Blaine does not get the nomination. With unanimity and enthusiasm behind a strong candidate in one party, and suspicion, demoralization, and a probably distrusted and weak candidate in the other, the contest promises to be the most one-sided in recent years. The positions which the two parties occupy on the great questions of the day add materially to this one-sidedness.

It is now no longer doubtful that Mr. Chauncey Depew is among the contestants for the Chicago nomination. This is a great discouragement to the Blaine faction, for it means that New York will at least be divided at Chicago, whereas Mr. Blaine's chances depended upon a substantially unanimous support from this State. The heaviest blow at the Blaine movement, however, was struck at Springfield, Illinois, on Wednesday week, when the Republican State Convention presented the name of Judge Gresham with a degree of cordiality and enthusiasm that left no suggestion of a backward thought. Not only was Judge Gresham endorsed in the warmest possible manner, but Mr. Blaine was evidently selected for reproof in the resolutions of the Convention, which demand the candidate "whose character and record command universal confidence," and who can make "an aggressive and not a defensive campaign." If these resolutions had been passed by a Mugwump Convention, they could not have been more pointedly levelled at the Plumed Knight. They will be accepted everywhere as a sign that one State at least, and a very important one, is fully delivered from the Blaine superstition, and is ready to assume the offensive in the anti-Blaine movement.

Judge Gresham's chances of receiving the nomination are, however, not very flattering. His position is very similar to that of Gen. Bristow at Cincinnati in 1876. He represents the best elements of the party, but the very aggressiveness of his Illinois supporters, while it challenges admiration, will excite the bitter hostility of the Blaine faction. Moreover, it has been repeatedly charged, and is universally believed, that Mr. Gresham was very cold in his support of Blaine in the last campaign. He was one of the "suspects" of the Arthur Administration. He has been charged with latent heresy on the tariff question. This charge has been made by the Grand Inquisitor, the Bulletin of the Iron and Steel Association. We presume that the charge has foundation in the fact that Judge Gresham looks upon the tariff as a matter of details, and holds that it is always open to debate whether a duty of 100, or 75, or 50, or some other per cent. on any given article is best calculated to promote the public interests. This is heresy in the Republican party, and accordingly there will be added to the forces opposing Judge Gresham all the power of the dominant faction, which demands that the present tariff be let alone, and that the needed reduction of the surplus be taken off the internal revenue.

Of all the humbugs ever put forth by the Blaine managers, the anti-saloon party ought to be placed first. Every year it goes through the perfectly transparent farce of holding a "Convention" which represents nobody save the few persons who come together of their own accord and resolve that, while rum is a dreadful evil, efforts for the suppression of it ought never to assume a form which will take votes from the Republican party. One of the speakers at last week's session "gave away the game" by saying that the "defeat of James G. Blaine by temperance votes in 1884 was a crime." This was received with tremendous enthusiasm, and it ought to be made the declaration of principles by the "Convention." It is noticeable that all the Presidential candidates who were invited to attend this year were unable to be present, and sent very guarded regrets. It would be interesting to know who foots the bills.

The recent Democratic State Convention in Iowa was notable for the support which was given the policy of civil-service reform, both in the speech of the temporary Chairman and in the platform adopted. Mr. J. C. Cook devoted a large part of his speech to this subject, declaring that reform in the civil service is one of "the live questions of a living future," commending what President Cleveland has done in this direction, and expressing the hope that the Democratic National Convention will in this place the party upon firm and advanced ground. The resolution adopted is by far the most progressive put in any Democratic platform:

> "In appointments to all offices the duties of which may reflect the policies of the Administration, persons should be selected whose principles harmonize with the party having the responsibilities of such Administration. But subordinates should be selected and retained for their efficiency. Levying assessments upon office-holders for partisan purposes cannot be too strongly condemned, and we commend in the fullest extent every effort which President Cleveland has made in the direction of the reform and elevation of the civil service."

The most interesting and hopeful feature of the incident is the fact that the attitude of the temporary Chairman and of the Committee on Resolutions correctly represented the sentiments of the majority of the delegates. Not a sneer about "snivel-service reform" was heard in the Convention, and while nobody pretends that all the delegates were hearty believers in the new system, everything indicated that if the spoilsmen had made a fight for a plank like the one adopted by their brethren in Indiana, they would have been beaten by a good majority.

There is a growing schism in the Republican party in reference to the sugar duties. Mr. Caswell of Wisconsin made a speech in the House on Friday in favor of repealing these duties entirely, and giving a bounty to the planters. In this policy Mr. Caswell undoubtedly represents the views of the bulk of his party in the West. But Mr. Kelley and the extreme protectionists of the Pennsylvania school will listen to nothing of this kind. They fear the example of a repeal of duties on any American product, and especially do they fear the reproach that would be cast upon their system by direct payments from the Treasury to support an industry. The alternative measure, and the only one for getting rid of the surplus, is the repeal of the internal tax on liquors. But the Western men will not listen to this scheme. In the event that a direct issue is made in the party between the two plans of reduction, it is almost certain that the Western men will carry their point, since the tariff-reform sentiment is so strong among the people that some concession on import duties must be made, and since the repeal of the sugar tax secures the largest reduction of revenue with the least uproar in the protectionist camp. It does not follow that the Western Republicans would fight very valiantly to secure a bounty to the planters, or that they would be much distressed if the bounty system should involve protectionism in serious embarrassments hereafter. In short, the Republicans west of Ohio are much more concerned with the present predicament than with any possible future one. The ultimate fate of the high-tariff system does not give them bad dreams, as it does Mr. Kelley.

Mr. Henry Cabot Lodge has been signalized in the character of a crawfish a good many times since his appearance at the Chicago Convention as a terrible opponent of Blaine. On Thursday Mr. Wilson of West Virginia brought him to book once more in the House of Representatives. It was his own book—the 'Life of Alexander Hamilton, by Henry Cabot Lodge.' Mr. Wilson read some extracts from this work, showing that in Mr. Lodge's belief Mr. Hamilton, if living to-day, "would probably be foremost in urging a revision of the tariff," and that he "would not be one of those who support heavy duties in order to furnish to industries already firmly established a protection which accrues solely to the benefit of the manufacturer, and no one else." Then the following colloquy ensued :

Mr. Lodge—What is the date of that book ?
Mr. Wilson—1883.
Mr. Lodge—The copyright date ?
Mr. Wilson—1882.
Mr. Lodge—That was before the revision of 1883.
Mr. Wilson—When that was written, the average tariff in this country was 42.65 per cent., and now it is 47.1 per cent.

The revision of 1883! Mr. Lodge would have us believe that the revision of 1883 reduced the heavy duties that furnish to industries already firmly established a protection which accrues solely to the benefit of the manufacturer, and no one else. The difference between the copyright date and the date of publication, upon which Mr. Lodge lays such stress, must imply that he referred to the revision recommended by the Tariff Commission of 1882, which favored a reduction of duties equal to 20 or 25 per cent., and not to the revision actually made by Congress in 1883, in which the general recommendations of the Commission were completely ignored.

The snag against which Mr. Lodge ran is one which the scholar in politics is very apt to strike when he sinks the scholar in the politician. In fact, we fear, now that Mr. Wilson has given the hint, that Mr. Lodge will find a great number of disagreeable quotations from his own writings confronting him when he comes to make his speech on the tariff. For example, it would be just like some impertinent revenue reformer to bring up what the author of the 'Life of Hamilton' had to say about the taxation of whiskey: "No one will now question that Hamilton selected the most appropriate subject for taxation, which, in its nature, should always be taxed before anything else, and as heavily as it will bear." Still, Mr. Lodge would have a very ready reply, if he should be honest enough to make it, and it would be precisely what he said in reference to the opposition to Hamilton's excise measures: "The real difficulty was political, not economical." Mr. Lodge was at pains to speak, in answer to Mr. Wilson, of his "convictions" on the tariff remaining the same now as in 1882. Really, he has himself made this pretence unnecessary. In his 'Life of Webster' he put his position, and that of a great many of his party, in its true light. Speaking of the Senator's apostasy in 1828, in voting for the "Tariff of Abominations" in the face of his well-known economical convictions—an apostasy which, as has been remarked, was the premonition of the 7th of March performance—Mr. Lodge says: "Webster's course was a sectional one, but everybody else's on this question was the same, and it could not be, it never has been, and never will be otherwise." We shall await the "sectional" speech of the member from Massachusetts with great interest.

The Senate on Thursday adopted a resolution looking in the same direction as Senator Hale's investigation, calling upon the Secretary of the Treasury for detailed information as to all removals and appointments among the employees of the New York Customhouse since March 4, 1885. If nothing has happened in that establishment to bring discredit on any one since that date, it is but just to the officers, in these times of suspicion, that the fact should be made public in some authentic way. If, on the contrary, the civil-service rules have been evaded, or appointments or removals have been made in a way which is calculated to lower the President in the eyes of his supporters, it is but right that his attention should be called to it, and the voters made aware of it.

A Congressman recently received a letter from a man who served in the regular army before the war, and who now claims that he incurred disability at that remote period, asking that he might be given a pension. The request appears ridiculous, and yet a veto of a private-pension bill sent in by the President on Thursday shows that Congress has almost reached the point of granting pensions which have no closer relation to service in the Union Army during the civil war. A bill was passed granting a pension to the widow of Oscar B. Mills, who was appointed acting third assistant engineer in the navy in October, 1862, was promoted to the place of second assistant engineer in 1864, and served throughout the war without incurring any disability. In 1872 he was retired on the ground that he was laboring under general debility, resulting from a fever, but there was no pretence that his fever was contracted before 1868. On the 10th of August, 1873, he was accidentally shot and killed by a neighbor who was attempting to shoot an owl, and on this showing Congress proposed to grant his widow a pension. The President well says, in the message refusing his approval of the act: "As long as there is the least pretence of limiting the bestowal of pensions to disability or death in some way related to the incidents of military or naval service, claims of this description cannot consistently be allowed."

The *Tribune* appears to have gone a little crazy in contemplating the sins of Secretary Fairchild in the way of inflating the currency. It recites a supposed pledge of the present Administration that it "would resist every form of inflation, and especially prevent silver inflation." And now, it asks, "What of the performance?" Then it answers its own question thus:

"There has been an enormous expansion of the currency, and especially of silver notes issued. The amount of silver coin in circulation has increased $20,000,000, and the amount of silver certificates from $113,000,000 to $194,000,000. The circulation of gold certificates has also increased from $38,000,000 to $96,000,000. It is not just now to the point to discuss whether this has been wise or unwise. The fact is, that there has been an enormous expansion of the currency under a President who was represented as favoring a sound currency, and particularly as hostile to silver inflation."

Did the *Tribune* ever hear of the silver-coinage act, passed in President Hayes's Administration, which requires the Secretary of the Treasury to purchase silver bullion and coin not less than $2,000,000 worth per month? Does it know of the existence of a law requiring the Secretary to give silver certificates to anybody who deposits silver dollars in the Treasury and asks for them? Would the *Tribune* favor the policy on the part of the Secretary of ignoring the law and refusing to execute it? Would it recommend that after the silver dollars have been coined the Secretary should refuse them to anybody who wanted them and was willing to buy them at the price of 100 cents each? Why not state the sins of the Secretary in plain English, so that we may see whether there is any chance for absolution in this world or the next?

The firm of W. T. Coleman & Co. of San Francisco, which has just made an assignment for the benefit of its creditors, is another of those firms whcih have been brought to grief by Cleveland, or Mills, or somebody in politics. Many firms, as we can all remember, were getting along beautifully until Cleveland's nomination began to be talked of. The public then stopped buying their wares, and down they came. Our readers may recall the case of one firm which was ruined in the midst of prosperity by the general refusal of the public to buy steel springs, when it began to be rumored that Cleveland would get the Democratic nomination. "No more steel springs for us," the people said, "till we see whether this nomination will really be made." The experience of W. T. Coleman & Co. has been somewhat similar in its tragedy. Their assets, they say, are "$4,000,000 to $4,500,000," their liabilities "about $2,000,000." One would suppose that a firm which could make such a showing as this would pull through without difficulty—that plenty of help would be offered in many quarters. Unhappily, the firm had some "borax properties" with which they expected to save themselves; but what does the Committee of Ways and Means do but put borax on the free list in the new tariff bill? After this, there was no hope for W. T. Coleman & Co. The creditors, when they heard that borax was on the free list, broke off all negotiations, and the firm had to fail. It was in vain they showed the creditors their $4,000,000 to $4,500,000 other good assets. They kept saying: "Aye, but look at your borax. What is to become of your borax ? Who will now buy borax?" and other observations of a similarly heartless character.

It is thus that changes in the tariff overwhelm proud houses.

The end to the C., B. and Q. strike, which we might almost call the usual end, has come at last. The "strike" has for over a month consisted simply in the support of the strikers and their families out of the funds of the Brotherhood of Locomotive Engineers, and in the communication to the newspapers of flattering tales about the incompetency of the new men employed by the company, and of the growing indignation of the public with the way the road was managed, and of the certainty of "victory" in the near future. Why strikes are prolonged after the strikers' places are filled is one of the mysteries of the "labor problem" which cannot be solved with our present means of information as to what goes on in trades unions. It must be in large part due, however, to some sort of deception practised on the men by their leaders, but it was generally supposed that the work of humbug was more difficult among the engineers than in other labor organizations. The strike has not been formally declared "off," but the men are at last convinced that the road can do without them, and accordingly the Chairman of the Grievance Committee makes this most melancholy but familiar announcement:

"The strike has not been declared off formally. The men, however, have been allowed to secure their old places with the company at the best terms they can get, whenever they can do so; and those who can't get work here will go somewhere else. A meeting of the Grievance Committee has been called, and what it may decide to do I can't say."

Probably no outsider can form any adequate idea of the amount of disappointment, and heart-sickness, and privation which this formula covers up. But it must be said for the strikers that they have been on the whole very peaceable, and have done little damage, considering that they have been laboring under the belief that the company was wrongfully keeping them out of places which they were entitled to keep on their own terms for an indefinite period.

The Harvard Overseers have fallen into the pit of compromise on the subject of intercollegiate athletic contests. Instead of frankly following up the principle of action indicated by the admitted evils, and expressed in the report of the large majority of its committee, they have adopted the minority report, but with modifications which make it even more unpalatable to the undergraduates. They recommend confining the contests to university teams and virtually to New England colleges, saying that such contests "should take place only in Cambridge, New Haven, and such other New England city or town as the Committee on Athletics may from time to time designate." Moreover, the time for holding them should be only Saturdays and holidays. The *Crimson*, in a very outspoken article, calls this a monstrous proposition, of which the practical result will be the abolition of the contests sought to be regulated. And, indeed, it is self-evident that, in taking Harvard out of the League, defeat is invited in any encounter (except boating) with Yale, for want of the same discipline against first-rate antagonists; and regular defeat means discouragement and disgust for the loser. Nor, we suppose, is it certain that, under the new conditions, Yale would condescend to play with Harvard at all, while to be shut up to the minor New England colleges would be intolerable to Harvard. The Overseers are therefore accused of seeking indirectly the end which they affect to repudiate. The *Crimson* hints at rebellion; but most significant is its remark that "such a radical change in the whole athletic system would, we firmly believe, put the axe to the roots of our social system as well." No observer of the relation between "society," wealth, and extravagance and athletics at Harvard can doubt the truth of this.

An impression exists, and it is apparently well founded, that Mr. Matthew Arnold's last article on America attracted scarcely any attention in England, and this not from any habit of non-attention to Mr. Arnold's writings in general, but because the article itself was superficial and not worthy of Mr. Arnold's great reputation. In this respect it resembled some of Mr. Carlyle's later objurgations on the same theme, which were treated by his English admirers and friends as the pardonable eccentricities of genius. But in one quarter of England Mr. Arnold's article continues to excite profound emotion. Mr. G. W. Smalley, the Norfolk squire, returns to the subject in the *Tribune* of last Sunday in a deeply affecting letter, which shows how the life-long friendship and intimacy that existed between Smalley and Arnold was lacerated by the article. In a former communication public attention had been drawn to the modern Damon and Pythias, and to the estrangement threatened by the untimely publication of the article. One could hardly resist the conviction that if Mr. Arnold had submitted his manuscript to Smalley beforehand, the distressful consequences would have been avoided. Recurring to the subject in his last letter, Smalley protests that it is altogether a mistake for Americans to say that they don't care what Arnold thought about their want of porters and cheap cabs at railway stations, and their other shortcomings, which made his visit so uncomfortable. "You do care, and you must care," says Smalley, because "in no conceivable event can the relations between the United States and England be a matter of indifference to the people of either country."

How closely these relations were bound up in the friendship between Arnold and Smalley, which was put in such peril by the article, is shown by a number of letters which passed between them at various times during the past five years. It would seem that but for the sudden death of Mr. Arnold this era of good feeling, so profitable to the two countries, might have resulted in permanent coolness, because Mr. Smalley acknowledges, in a penitential way, that when the article appeared he wrote a severe letter to Mr. Arnold, hauling him over the coals, setting forth, no doubt, the danger of an international rupture in the presence of the unsettled fishery dispute. But now that the grave has put an end to all possible complications, the country—both countries—will be touched to learn that Smalley deeply regrets that he spoke so sharply to Mr. Arnold, and that he would gladly recall those hasty words, as thus:

"From the general judgment I formed and expressed upon his 'Civilization in the United States' I cannot depart, but if there were a word in it which pained him as coming from a friend, I would give anything to recall it. There are many words which pain me as I look through all I have said—resentful words which add nothing to the force of the protest I wanted to make, but weaken it. I do not explain to myself how I came to use them, nor forgive myself for using them. If he had lived, it might have been no great matter; a blow given or taken is soon forgotten. But never does the *irrevocabile verbum* seem so hopelessly beyond recall as when the shadow of death has fallen upon him of whom it was said."

We are promised at least one more letter concerning Smalley and Arnold. It will set forth the final and deliberate judgment of the Norfolk squire on the literary productions of his friend before any shadow fell between them.

One of the latest adherents to Gen. Boulanger is the Rev. Hyacinthe Loyson, better known as Father Hyacinthe, who left the Catholic Church in disgust some years ago, married a wife, and has been carrying on some sort of Protestant place of worship in Paris ever since. He has been delivering a lecture on the "Republic and the Dictatorship," in which he expressed love for the republic and dislike of dictatorship, but at the same time denounced "parlementarisme." He then started off to call on Boulanger at his hôtel, but, not finding him at home, left a note in which he expressed abhorrence of anarchy and atheism, and called for "a strong, conservative, reformatory, and progressive authority—conservative of what is eternal in the life of the community, reformatory of what is bad in the inheritance of the past, and progressive in the sense of a larger application of justice and the Gospel to the physical and moral needs of the popular and laborious classes of the city and country." As no one but a brute could dissent from views of this sort, Boulanger, when he got home, sent Loyson an answer in which he said he entirely agreed with him, and added some sentiments of his own which rather eclipsed those of the minister, for he denounced government which is strong through the fear it inspired, and declared that "the people needed to be taken care of like a child," and held that it was for want of perceiving this that "parlementarisme" was going to die. Poor Loyson thought, doubtless, he was going to lift Boulanger up to a higher moral and political plane, but found that the wily Boulanger's philanthropy was several pegs higher than his own. The pastor wants to treat "the people" like boys of fourteen, while the General evidently wants to put them in petticoats and pinafores,

THE CIVIL SERVICE IN PHILADELPHIA.

We have read with care the evidence taken by the Sub-Committee of the Senate on "the operations of the civil service in Philadelphia." It shows clearly enough that Postmaster Harrity, as soon as he got into office, or rather as soon as he was confirmed, began to make changes in the Post-office which ended in something very like "a clean sweep." Now, considering the way in which offices were filled during the twenty-five years of Republican supremacy, we must not conclude that a "clean sweep" is, because clean, unjustifiable. There were undoubtedly offices in which, when President Cleveland came into power, a clean sweep was necessary for the good of the service. But in all such cases it was easy to make the necessity clear to all lawful inquirers. The unfortunate feature in Postmaster Harrity's case is, that no satisfactory explanation of his course is forthcoming or indeed seems possible; and by "satisfactory" we mean any explanation that will reconcile his performances with the President's utterances before and after his inauguration, touching the terms on which Federal officers should hold their places.

Very early in his official career, Mr. Harrity dismissed in rapid succession 113 letter-carriers without assigning any reason. Of these, 86 had been in the service for from six to twenty-seven years. Service as long as this creates a presumption of competency and efficiency in favor of any class of public officers, especially of officers like letter-carriers and sorting-clerks in a post-office, who are constantly exposed to the criticism of the public as well as to that of their superiors. No civilized Government ought, therefore, to get rid of them by wholesale, without giving the reason why. No appointing officer ought to be allowed to dispose in this summary fashion of men who have given their best years to the service of the community, without explaining to the community why it was necessary; and we never should have supposed that President Cleveland either would or could permit it—and we say this while holding firmly to the belief that the power of dismissal without explanation is one which every head of a public office ought to have, and in a great many cases must exercise.

But unfortunately we are not dependent for an explanation or any formal report upon Mr. Harrity. In fact, we get on probably better without one. He did not appear before the Sub-Committee, as Mr. Cadwalader, the Collector of the Port, did, but a swarm of dismissed carriers, working politicians, and aggrieved citizens did; and, putting all their stories together, it becomes very plain that Mr. Harrity's clean sweep was not remotely connected with the terrible fight going on in Pennsylvania between Scott and Randall, or, in other words, between the Administration and anti-Administration Democrats.

The investigation appears to have been brought about by a petition from the discharged letter-carriers, who formed some sort of association to call attention to their grievances, and a large number of them testified before the Committee. Some of this testimony is on its face of little value, but, taken altogether, it furnishes proof positive that the Post-office there has been largely remanned with political "workers"; that the political activity of the Post-office clerks and carriers, if not actually encouraged, has not been restrained; that they figure prominently at caucuses, and conventions, and ward meetings, and that their attendance at such gatherings has been facilitated and therefore encouraged by their official superiors; that the remonstrances of citizens touching the defects in the city postal service caused by these changes have been persistently disregarded by Mr. Harrity and his assistant, Mr. Drake; that new appointees were compelled, in filing their bond with two sureties, to pay a fee of $10 to Mr. Harrity's counsel and political crony—one Megargee—a charge unknown under Gen. Huidekoper, and unjustifiable under any one; that political circulars and calls have been printed in the Post-office on the Government press by the Post-office printer, either by Mr. Harrity's order, or with his knowledge and connivance. There was some, but not conclusive, testimony that assessments for political purposes have been extorted from post-office employees, but there was conclusive testimony that they pay such assessments freely, in the old belief that something disagreeable will happen to them if they do not.

Mr. Cadwalader, the Collector of the Port, came before the Committee, and made a very good showing as regards the management of the Custom-house. His account of the condition of the Custom-house service when he took charge was as follows:

> "The entire office, in my judgment, required reorganization. Every department of it was negligent and careless, and the habits of all the employees were such as I thought entirely inconsistent with the proper discipline of a public office—such as lounging and smoking, receiving visitors at all hours, newspaper reading by the clerks, general disregard of regulations, and a slipshod way of attending to all business, without exception."

He added, as the result of the change:

> "I can only say that from the time the change was made in that office, the receipts and the amount of business transacted increased in an extraordinary ratio, far beyond that of any port in the United States, until the receipts of this port have risen from $12,000,000 a year—about the highest amount ever received—until to-day they are $18,000,000, with no apparent increase of the business of the port."

This is an extraordinary statement, but it has not been gainsaid by anybody.

Of course, the condition of the Philadelphia Post-office must be regarded as a blot on President Cleveland's Administration, and also, in our opinion, a great political blunder. For Mr. Cleveland's renomination it has done simply nothing that was essential, because that renomination has been for two years a foregone conclusion. Nothing that postmasters, letter-carriers, or tidewaiters or gaugers could do could have prevented it any more than it could prevent water rising in a vacuum. What it will do is to lose him a good many votes among people who supported him four years ago on account of the enemies he had made, and who outnumber all the Federal office-holders probably twenty-fold. Nothing is more extraordinary in politics than the way in which residence in Washington magnifies the petty and servile horde who figure in politics as "workers," and dwarfs the great host of voters who, in these times, are prepared, in spite of all party ties and traditions, to stand by any candidate who convinces them that to him really and truly "public office is a public trust."

NO MONOPOLY OF ABILITY.

Previous to the inauguration of President Cleveland it was held almost as an article of the Republican creed that the ability of the country was practically monopolized by that party. The Democrats were usually charged with lack of patriotism, and accused of cherishing "treasonable schemes," to the success of which the continued dominance of the Republican party afforded "the only effective barrier," to quote the Vermont platform of 1880; but even if, in a burst of charity, they were credited with as much love of country and devotion to the public interests as Republicans, it was maintained that they lacked the ability to conduct the Government with efficiency. Nine out of ten Republicans had come to suppose that the only men qualified to fill high offices with distinction were Republicans, and that the American nation would cut but a sorry figure if its most important trusts were committed to Democrats. The Republican managers cultivated this idea as a taking argument for keeping their party indefinitely in power, and probably some narrow-minded partisans of the George F. Hoar school really believed, what that Bourbon actually said, that the Democratic party did not contain a lawyer who was up to the level of the late Chief-Justice Waite.

To the greater part of the people of the North, therefore, a most interesting and most valuable feature of the Cleveland Administration has been the revelation that there is no monopoly of ability as between the two great political organizations; but that, on the contrary, the Democratic party has men who, by the testimony of Republicans themselves, prove fully equipped for the highest positions. The first and greatest surprise of this sort was afforded by the career of Daniel Manning in the Treasury Department. His selection for that high office was the signal for a general outburst of severe criticism from the whole Republican press, and the idea that he could make even a respectable record as Secretary was deemed almost too generous. He retired only two years later with the confession by his political opponents that his name would go down to history in the short list of really great financiers, like Hamilton, Gallatin, and Chase, among the many men who have been Secretaries of the Treasury.

When Mr. Cleveland became President, James Russell Lowell occupied the most responsible post in the diplomatic service, and Republican organs—which then had only words of praise for him—used to be greatly troubled by thoughts of the discreditable comparisons which would inevitably be made

between the Republican incumbent and any possible Democratic successor. When Edward J. Phelps was appointed in his place, few people outside of New England recognized the name, but it is now admitted by everybody—except, of course, politicians who cultivate the Irish vote—that this previously almost unknown Vermont gentleman is one of the most accomplished representatives whom the nation has ever sent abroad, a man whom Republicans equally with Democrats may be proud of as a product of American institutions.

The Inter-State Commerce Bill intrusted most delicate and far-reaching power over the business of the country to a Commission of five men, three of whom were expected to be, and proved to be, Democrats. If it had been foreseen during the canvass of 1884 that this bill would be passed and this commission appointed, every Republican organ and stump-speaker would have declared that the business interests of the country could not safely turn over the selection of a body of men possessing such vast power to a President who would choose a majority of Democrats. The Commission was appointed more than a year ago, and only the most prejudiced of Republicans would to-day deny that it has done its work so remarkably well that it would be hard to see how it could possibly have been bettered.

When President Cleveland made the tariff the burning issue by his message, last December, and Speaker Carlisle appointed Roger Q. Mills Chairman of the Ways and Means Committee, many earnest advocates of reform wondered whether a mistake had not been made in selecting a man so little known to the country. Mr. Mills comes from Texas, and New England people were not much more familiar with his name than the people of Texas had been with that of Mr. Phelps. He has been in Congress several terms, but he had never come to the front as a leader of his party, and not unnaturally many people distrusted his fitness for the chairmanship of the most responsible committee. But the speech with which he opened the tariff debate three weeks ago showed that this Texas Representative not only had studied his subject deeply, but also possessed a power of stating his case which convinced every reader that here was a man worthy to stand at the front in a great controversy. A similar and hardly less gratifying surprise was afforded on Thursday, when an unknown Representative from West Virginia, William L. Wilson—who, it appears, has been lawyer, college professor, and President of his State University—leaped into prominence by a speech on the Mills bill which showed him "the scholar in politics" at his best.

Republican Presidents and Republican administrations in most of the States had been putting Republicans upon the bench for a quarter of a century, until people generally had come to think only of Republicans in connection with any vacancy in a judgeship. The highest judicial office fell vacant a few weeks ago, and has just been filled by a selection which commands the unreserved commendation of all who know the new Chief Justice. The most partisan Republican organs in his State admit that Mr. Fuller is in every way quite the equal of his predecessor, and gives on the whole better promise of a great career on the bench than did Mr. Waite fourteen years ago. Moreover, leading Republicans readily vouched for the conspicuous fitness of other Democrats—for example, William L. Putnam of Maine, Mr. Phelps of Vermont, Judge Clark of the Pennsylvania Supreme Court, Senator Gray of Delaware, and Judge Scholfield of the Illinois Supreme Court.

It is well to have it demonstrated that the ability of the nation is divided between the parties, and that either possesses enough to serve the country with honor. It probably never occurred to a man like Senator Hoar, but in point of fact his theory involved the failure of popular government. If it were really true, at the end of our first century, that one party monopolized the ability of the nation, democratic institutions had already broken down, and their final collapse was at hand. A nation almost evenly divided between two parties, while one of those parties was incapable of ruling it, could not long endure.

REMEDIES FOR OVERCROWDING.

It is easy to point out the evils and dangers due to the growth of large cities. It is much harder to suggest any practical means of meeting them. Three distinct methods have been proposed. The first may be described under the general name of tenement-house reform. Much good has been done in this way, and we should like to see it carried a great deal further than it has been; but at the same time it cannot be regarded as in any sense a solution of the difficulty. It is only a palliative, and a slight one at best. Improved sanitary arrangements require more space than the poorest people have in the crowded city districts. The effort to give them a little breathing room at one point only creates greater pressure at another. If under the new system thirty people occupy the ground which formerly was inhabited by fifty, what becomes of the other twenty? They seek homes in some adjacent district, and add new fierceness to the struggle for standing-room there. If we give elbow-room to a few persons in a crowd, it simply readjusts the pressure. It does not remove it; on the whole it tends to increase it.

Nor do these improvements generally accomplish the desired result for those who most stand in need of it. It has been the experience in England that model tenements were used not by those for whom they were originally designed, but by persons a grade or two higher in the social scale. Instead of giving the poorest people better accommodations at the same price which they had been paying for worse ones, they have often given people in moderate circumstances the same accommodations to which they were accustomed at a lower price than they had been paying. This may or may not have been an equally desirable result; at any rate it was not the result originally proposed by the promoters of the scheme. As for the evils of crowding, it increased rather than lessened them.

The experience of Mülhausen was described at length in these columns a few months ago. This was a case where the policy of model tenements was pursued systematically. What was the result? Some of them were occupied by workmen of the better class, to whom they formed a source of comfort and economy. Others, which were occupied by the lowest class, soon became as crowded and as vile as the buildings which they were designed to supersede. Different rooms were sublet to different families; and the cottages, as thus perverted from their original design, proved in some respects worse than the old tenements intended for several families and arranged with that end in view. The experience of Mülhausen seems to prove that even the most systematic tenement-house reform treats the symptom without touching the disease.

A similar objection applies to Henry George's proposed remedy, the second of the three which we are considering. George thinks that if more taxes were put upon ground-rent and less upon improvements, the available space would be better utilized, and a great many men who are not followers of George in his extreme theories agree with this proposition when stated in its moderate form. Within limits, it is undoubtedly true. If the population remained the same, the improved utilization of space would do much towards relieving the difficulty. The trouble is that the population would not remain the same. As more room was made, the city would fill up faster. The fact that space was better utilized would make it a more desirable place of business or residence. The advantage of freer space, whether it were great or small, would be neutralized by the influx of increased crowds. George's remedy goes a little deeper than that of the tenement-house reformers, but it by no means reaches the bottom of the difficulty.

What has been the reason for the rapid growth of large cities? Many causes might be named, but the most important one is the great development of means of transportation, and especially of railroads. Before the invention of railroads it would have been impossible even to feed a population like that of London at the present day. Our experience in the recent snow-storm will bring this aspect of the matter forcibly before the minds of New Yorkers. It is to railroad service more than any other one thing that the growth of large cities is due. It is here, if anywhere, that the cause of crowding is to be sought and the remedy to be applied. This is the last of the three remedies to which we referred, and one which seems to offer a better chance of success than either of the others.

The effect of railroads upon cities has been of two kinds. The freight business had the effect of increasing their size, both by centralizing industry in large masses and by increasing the means by which such centres could be supplied with food. It at once widened the area over which a city could distribute its products and that from which it could be supplied with food. The passenger business, on the whole, had an opposite tendency. It enabled people to live at a greater distance from their work; if neces-

sary, to do business in the city and sleep in the country. But of these different tendencies of freight and passenger business the former was much the stronger; and it unfortunately happens that the policy of American railroads has given the fullest play to the centralizing tendencies of the freight business, while it has left undeveloped certain possibilities in the passenger business which might have been used to counteract them.

The low rates given to producers in large cities, as compared with intermediate points, have been a fruitful source of crowding. If a manufacturer was deciding whether to locate his works in the city or in the country, he carefully balanced the advantages of the two. In the city he was in close communication with his customers; in the country he had more room, lower rents, and lower taxes. There was a fair balance between the two. But when the railroads gave preferential rates to the city, they put an unfair weight in the balance. They made it necessary for the manufacturer to locate in the city, irrespective of other conditions. They made the trade centre the centre of production also. A city is almost of necessity a trade centre; it is not thus necessarily a centre of production. The good of city life springs largely from the former character, the evil from the latter. By crowding the factories we crowd the workmen; we deprive them of breathing space, and produce all sorts of dangers to health, morals, and social order. In the end we sometimes hamper trade itself by the intensity of the pressure of productive industry about it.

Something of this is inevitable; the real ground of complaint against the railroads is that they have allowed it to be increased to an unnecessary and artificial extent, by a policy from which the community suffered, while the owner of city real estate was the only one to reap the benefit. So far as the short-haul clause of the Inter-State Commerce Law can check this, it will be a decided public benefit. But even if the factories are in the city, it is possible that workingmen's homes may be in the country. It is to some extent, though not wholly, a question of cost. If fares be made cheap enough, a great many people will be found to take advantage of them. Such, at least, has been the experience in Belgium and Saxony, and to a less extent in Prussia, Austria, and England. The workmen's trains in Massachusetts did not have rates low enough really to test the principle. It is quite possible that a train charging a cent a mile should be less profitable than one charging half-a-cent a mile. If the traffic at half-a-cent a mile is something new which you have created by your policy, it may be made profitable—witness the experience of our roads with commutation rates. If the traffic at one cent a mile is much of it simply transferred from other trains, it is distinctly unprofitable. All depends upon whether the traffic is new or simply transferred. The European roads find that by running workmen's trains at half-a-cent a mile or less they obtain new traffic on a large scale. It is simply the commutation theory, with a weekly instead of a quarterly subscription. Our commutation rates are low enough, but the workman has neither the capital nor the steadiness of employment to make it possible for him to take full advantage of them.

We do not look to legislation to secure this result, but to the self-interest of the railroads. They have developed long-distance traffic until it has become unprofitable. If they are to make money in the future, it must be largely by local traffic. A policy of the kind here suggested brings not merely the direct return from the trains themselves, but a large incidental traffic between the homes in the country and the source of supplies in the city. We cannot help thinking that in this matter our railroad officials will soon see that the public interest is their interest also.

It is one question where people shall sell their goods, another where they shall manufacture them; still another where their workmen shall live. There can be but one answer to the first question. It must be in the city—probably even more so in the future than in the past. But it by no means follows that the second and third questions must be answered in the same way. So far as the present state of things can be traced to the adoption or to the omission of special lines of railroad policy, there is reason to hope for a change, by which factories and homes shall become more scattered even in the face of increasing concentration of trade.

THE RUMANIAN PEASANT REVOLT.

The disturbances in Rumania, which, according to cable reports, have broken out anew, this time near the Russian frontier, were undoubtedly fomented by Russian intrigue, although the wretched economic condition of the peasantry alone would be a sufficient explanation of the rising. In spite of the natural fertility of the soil, the Rumanian peasant, ground down by the exactions of the tenant-farming capitalists, is at best unable to make more than a bare living by his labor. The failure of last year's maize crop and the unusual hardships of the past winter completed the general dissatisfaction, and the seductive promises and inflammatory appeals of Russian emissaries and native demagogues found willing ears.

For the past year itinerant Russian picture-dealers have been impressing the simple villagers with portraits—gratuitously distributed if necessary—of the Czar of Russia, surrounded by the other European monarchs as by satellites, and looking down benignly on two kneeling Rumanian and Bulgarian peasants; and the hope has been freely held out that if the Rumanian Government did not grant the demand for a redistribution of the land, the Russian liberator soon would. In their turn the adherents of the late Premier, Bratiano, and those of the present Premier, Rosetti, accuse each other of deceiving the peasantry by false promises. The Young-Conservatives, whom Rosetti represents, assert that Bratiano, immediately after suppressing the first rising at Urticeni, spread the report that if he resigned and Rosetti became Premier, the new Cabinet would submit to the Chambers a proposal to reduce all the peasant holdings in number. The Old-Conservatives, on the other hand, maintain that even while Bratiano was still in power, the followers of Rosetti poisoned the minds of the villagers by relating to them that the late Prince Cuza had left to every municipality the sum of 5,000 francs, which, however, was surreptitiously withheld by Bratiano. "March into the cities and demand your rights," is said to have been the Old-Conservative advice.

Whatever the cause of the revolt, the effect has been very serious. Originating in the village of Urticeni, in the district of Jalomitza, it soon spread to the neighboring districts of Prahova and Ilvof, and to the villages of Afumaz, Stefanesci, Branesci, and others in the immediate vicinity of the capital, Bucharest. The tenant farmers, local mayors, and village priests bore the brunt of the fury of the mob. Everywhere the cry was for the redistribution of the land and for restitution of the Russian gift money wrongfully withheld. In some places the village officials were asked to promulgate immediately a law supposed to have been enacted, but never executed, reducing the share of the farmers in the yield of the peasant's labor from one-third to one-tenth. The Mayor of Stefanesci, who attempted to argue with the mob, was cruelly murdered, and those of Afumaz and other places and a number of priests were severely wounded. The farmers fled in terror to Bucharest, whence several regiments of cavalry were finally despatched to the centres of the revolt, which about two weeks ago was reported as quelled.

The new Premier, Rosetti, in the meanwhile, when interpellated in the Chambers by the Opposition as to his intentions, declared that for the present he would refrain from announcing a programme, that the country was too agitated to make the dissolution of the Chambers and an appeal to the electors safe. He added that while convinced of the necessity of dissolution, he would not, in compliance with the demands of the Opposition, dissolve the Chambers as a prerequisite to their passing of the ministerial budget. The *Romania Libera*, the organ of the Young-Conservatives, defines the ministerial programme in the usual official phrases as one aiming at "the pacification of the public mind," "the checking of abuses," "the punishment of every law-breaker," etc., etc., and the Minister of Foreign Affairs, Mr. P. Carp, has promised to regulate the monetary standard, to establish fixity of judicial tenure, to modify the conmmunal laws, and to promote the cause of higher education. But while these assurances have been potent enough to secure to the Rosetti Ministry the temporary support of a few National Liberal and Old-Conservative Deputies and Senators, it is evident that nothing short of a thorough agrarian reform will permanently satisfy the peasantry, and prevent the rekindling of the riots whose consequences may affect wider interests than those of Rumania.

THE RIVIERA.

NICE, April 18, 1888.

THE present season on the Riviera has been, on the whole, not a successful one, neither the climate nor the weather having been such as is usually expected. On the 29th of December snow to the depth of five inches occurred, killing many fine plants and orange trees, and for a few days causing much distress and rendering the streets and promenades unendurable. There have also been an unwonted number of cold, raw winds, with frequent abrupt changes of temperature. This applies to the littoral as a whole. The marked lack of visitors has not been wholly due to the fear of a repetition of earthquakes (though the one of last year is still in vivid remembrance), but is in all likelihood due to the universal shrinkage in incomes. The leisure class is diminishing enormously in Europe, particularly among the English—the bulk of the visitors—and these are falling off correspondingly. When one considers the economic condition of the land-holding class among the English people, the "Irish question," with its widespreading injury, the diminution of profits in corporate enterprises, and the very general feeling of insecurity regarding social problems and the peace of Europe, the cause is readily perceived.

Cannes, with its many exclusive villas—here the "hotel boarder" has been nearly driven out by the "cottager"—has shown this as much as the more cosmopolitan Nice, and though it really seems to offer a better health site, more protection from harsh winds, and a more orderly local population, yet it is evident that more villas are unoccupied this season than ever before, and the hotels are mainly given up to visitors of a few days only. The town is beautifully situated, the environs are well wooded, roads are less dusty and white, and there seems to be a greater profusion, if not variety, of vegetation, than in the resorts further to the eastward along the shore. There is no more charming spot on all the coast than that in the vicinity of St. George's Chapel, erected in memory of the Duke of Albany by the Queen, the whole side of the hill being given up to elegant cottages and villas, surrounded by the most lovely parks and gardens, the drives leading to the highest peak, which overlooks the region for miles, and is named "California." Here are situated the villas of the royal family of England.

The usual attractions are held out by all the municipalities, including public music, fêtes, balls, carnivals with confetti and flower battles (very tame this year), and flower fairs—most interesting and beautiful exhibitions of the floral capabilities of this favored region. The Nice carnival requires more than a week's time and prodigious labor, and is a unique performance, yet very ridiculous, and tawdry to the last degree. The city shows but few signs of last year's earthquake, and the city government manage excellently well the repairing of buildings and streets, so that the damage done has been obliterated, and it is hard to realize that such a tremendous shaking-up ever occurred here. For those in search of amusement, social as well as public, such as balls plain, balls masked, and balls mixed, public display, the horse-play of a carnival, wide, dusty streets, and the presence of many thousands of questionable people among its population, Nice has much in its favor. Excepting Monaco, including Monte Carlo, all the other resorts offer in probably greater degree more shelter, purer air, and all the elements of a quiet, healthful sojourn. For a few months San Remo has been signally full of people, the Germans being in possession.

It is well known that many questionable characters of both sexes frequenting Monte Carlo habitually reside in Nice, where the police have them registered to the number of over two thousand. These people are always seen on the trains, in the hotels and cafés, gaming-rooms, and theatres. In the gaming-rooms crowds of visitors are always to be seen during the season. There are now nine large tables constantly in use, three for trente-quarante, at which the minimum wager is one napoleon (about four dollars); and six for roulette, the lowest wager being five francs (one dollar). At the opening of the doors at eleven A. M. daily, Sundays included, the crowd that has been collecting for the previous fifteen minutes rushes in for seats and favorite places at tables, and the last play finishes near 11 P. M. It is an extraordinary spectacle to see gray-haired men and women, pale, dissipated adventurers of both sexes, the anxious and deperate, with here and there the casual self-respecting, yet curious, tourist, all pell-mell rushing over the polished floors in a mad grab for place to sit and gamble on the turn of a card or of the fascinating wheel. These people are all well dressed, and must have their addresses and selves scrutinized before being given a ticket of admission, which is sometimes issued daily. The rooms are lofty and palatial and the decorations superb.

The beautiful theatre is always offering attractive music, drama, and opera; and the weekly classical concerts here given gratis, under the direction of Arthur Steck, by an orchestra of nearly a hundred fine musicians, are probably not surpassed anywhere. On some occasions of operatic performances large prices of admission are charged, but the usual daily afternoon and evening concerts are free to all the Casino visitors. This building stands upon a rock and has no proper system of drainage, and for this reason the air in parts of the building and in the gaming-rooms is at all times foul and oppressive—palpably so to one first entering.

The neighborhood of Monte Carlo is superior to any on the Riviera for pure comfort of living to invalids: rain and harsh winds are less frequent, and the daily range of temperature seems to be not so great or sudden; but there is far less diversity of occupation or amusement. The gardens and park are extremely interesting and instructive, for here one sees, growing in the open air in winter, a surprising number of magnificent specimens of indigenous and exotic plants, while the walks, though limited, are beautiful, containing many charming views. Local writers along the Riviera are prolific in descriptions of the beneficent and healthful qualities of their several favorite resorts, and one reads of tonic, excitant tonic, sedative tonic climates, and the dreaded mistral in varying quantity, in contiguous localities, with more or less bewildering refinement in treating of the influences of the sea, sun, or the various adjacent slopes. The best that can be said is, broadly, that these mountain-protected shores, exposed to sunshine the majority of days, give certain invalids a near retreat during the harsh northern winter, and only a partial outdoor life; but with the defects of lime-dusty roads, sudden temperature changes on the declining of the sun, bad drainage and water supply in parts, and poor meats (compared with our standard). The dryness of the air is also not always desirable in lung and throat disorders. When the mistral is abroad, one must remain indoors by the fire to be comfortable. It is said that there are no warm houses in France or Italy in winter, and to the average American of hot-house habits and tender throat this is above all the greatest annoyance.

The commercial treaty being in suspense, there is a war of tariff rates, almost prohibitory in its effects, between France and Italy, and the ordinary market products and wines (for Italy in great part feeds the Riviera) are trebly taxed now. There is much jealousy and ill-feeling and frequent small difficulties at the frontier, and it is quite possible that the Italians in France may yet go into Coventry along with the Teuton, if matters are not better accommodated in the near future. There is also agitated the project of steam communication between Nice and Algiers, but this is manifestly improbable, as the former has nothing to send in return, on a paying basis, for the food supplies from the latter country. There are now, however, infrequent steamers from Algiers stopping here en route to Genoa.

War preparations continue on both sides, and huge guns are being transported to new works on the mountains, even to their tops, in prominent and commanding positions, while by sea the huge ironclads and torpedo vessels patrol the coast. There is even evidence of an adaptability to war purposes in the masonry work of the railway tunnels, common roads, and embankments. The many garrisons and recently constructed workshops and barracks for troops all bear witness to the prevailing activity. Still, the people are habituated to these things and continue farming their vegetables, orange and olive groves, at a fair profit, catering to the wants of the stranger, whose money is usually cast about freely. With it all, the unreading peasant buries or secretes his savings as he has ever done in the past: one frequently comes upon bright new coins minted a score of years ago.

In old Nice probably half of the population are Italian, but they are fast forgetting their native country and its heroes, and the statue of Garibaldi projected for his native city is in abeyance for lack of funds. The Italian Consulate in its activity resembles one of our county-office buildings with its staff of clerks, waiting-rooms, attendants, shelves full of registers upon all subjects from the coming in to the going out of the world, and its general importance to many of the inhabitants. The consular officer in charge is a man of note in his country, and affixes his signature to documents like a minister of state, using the surname only.

C. A. SIEGFRIED.

FREDERICK THE GREAT AND GERMAN LITERATURE.

BERLIN, April 22, 1888.

A SERIES of excellent articles have been from time to time appearing on the relation of Frederick to German literature. These have now been collected and revised, and were recently published in book form under the title, 'Friedrichs des Grossen Schrift über die Deutsche Litteratur.' The author of this charming brochure is Prof. Bernhard Suphan, keeper of the Goethe archives in Weimar. In Weimar, now, as a century ago, centres to a large extent the literary interest of Germany. The earnest enthusiasm of her Royal Highness the Grand Duchess of Saxe-Weimar, whose property the archives are, has summoned to the task of editing these treasures in monumental form the best talent and learning of Germany. It is about one year since Prof. Suphan was called to the position he now occupies, and of his address on Herder and Goethe, at the May meeting of the Goethe Society, a correspondent of

the *Nation* gave at the time an account. The greatest debt of the literary world to Prof. Suphan, however, is the first critical and satisfactory edition of Herder's works, which is now nearing completion. It is from this graceful pen that we have the five instructive chapters on Frederick's essay, which suggested the present letter. The book is dedicated to Herman Grimm.

The last half of the eighteenth century in Germany must be designated as the era of Frederick the Great and Goethe. For the first time in the literary history of 2,000 years, we have a great literary epoch for which the name of the greatest contemporary ruler is an inadequate description. The names of Augustus, Charlemagne, Elisabeth, Louis XIV., call up each a complete notion of the period in which they lived, and of the production, artistic, literary, political, industrial, and economical, that went on about them. The name of Frederick the Great, however, associates itself only with an age of martial heroism and brilliant victory, of vigorous economic administration, the establishment of Prussian prestige, and the deepening of the national self-respect. His name does not suggest that the years of his famous successes were also the years when German literature was ripening to maturity, and the first fruits had already fallen. Goethe!—and all the productions in the fields of art, poetry, philosophy, and science through a half-century of earnest effort and brilliant achievement, are recalled in association with that name. The sum of the last half of the preceding century amounts to Frederick the Great and Goethe. Lessing, with all his admiration for the Prussian King, denies him every claim to thanks at the hands of German literature, but adds: "I should not be willing to swear that a flatterer may not one day come who will think well of calling the present era of German literature the era of Frederick the Great." This fear has not been realized, but there are reasons why his name should be associated with that of Goethe, even in speaking specifically of the literary epoch—but of this more hereafter.

Frederick's celebrated essay, 'De la Littérature Allemande,' appeared in 1780. It is in the form of a letter, and begins with a rapid sketch of the history of universal literature. Of England's great era we find recognition under the names of Milton and (particularly) of Bacon, but of Shakspere's works only the drastic mention: "les abominables pièces de Schakespear, . . . ces farces ridicules et dignes des sauvages du Canada." For this bungler, however, there is some excuse: "On peut pardonner à Schakespear ces écarts bizarres, car la naissance des arts n'est jamais le point de leur maturité." But what excuse can be found for a 'Götz von Berlichingen,' an "imitation détestable de ces mauvaises pièces angloises, et le Parterre applaudit et demande avec enthousiasme la répétition de ces dégoûtantes platitudes."

For the good work that had begun to appear, Frederick had no understanding. In an effort to give the devil his due, he mentions with praise a poem and poet both long since forgotten, and professes to discover in the work an agreeable cadence, of which he had not believed the German language capable. Of Lessing, Wieland, Klopstock, Herder, there is no word. But upon this circumstance, and upon the oft-quoted passages above, too much weight has been laid. They have an historical interest for the curious, but they do not characterize the essay. It is not polemical, nor was it intended to check the growing influence of the English drama. The historical representatives of German literature were still adherents of the French school. Only the younger generation had broken with the traditions, and of these writers Goethe alone receives so much as mention. The absurd passages which Frederick cites as examples of German bad taste are such as he would not have attributed even to a Shakspere. Nothing could be more ridiculous than the charge which chauvinistic mediocrity brought against him, as later against the author of 'Hermann und Dorothea,' of a lack of patriotism and German sympathy. The real spirit of the essay is one of earnest endeavor towards a better state of things.

It is not the method of his friend Voltaire. Frederick is constructive, and takes hold of his subject with a firm, practical grasp. He seeks the way to improvement, and looks confidently into the future with prophetic visions that have been most brilliantly realized. He lays great weight upon the study of the ancient languages and literature, points out the necessity of good translations in lieu of feeble imitations, and seeks the standard of taste in France. The importance of purifying and perfecting the German language is especially emphasized. In consequence of the numerous and deeply rooted dialects in Germany, the establishment of an Academy, to the decisions of which absolute submission be required, seemed unavoidably demanded. A certain justifiable particularism has rendered an "Academie der Sprache" impossible to this day, but the idea has not been lost sight of, as an address of Prof. Du Bois-Reymond in 1874 shows. To Frederick, the impossibility of a national literature in an imperfect tongue was clear. His suggestions for rendering the language euphonious were less happy (as adding to consonantal endings an *a*: *nehmen-a*, *geben-a*, etc.), but everywhere is the vigorous practical attempt to point out the way, excite discussion, and rouse the talent and learning of the land to earnest efforts in rendering possible and eventually creating a German national literature, worthy of a place among the greatest of the world.

Fourteen years before Frederick wrote these words, a dissertation upon modern German literature had secured for Herder the first prize from the Academie der Wissenschaften in Berlin, and that dissertation had become a kind of rule of faith for the younger generation. Of this dissertation, however, Frederick's essay makes no mention, and it is, therefore, highly interesting to notice, what Prof. Suphan points out, how nevertheless, in almost all essential points, the views and aims of the young Herder in 1766 coincide with those expressed by the King of Prussia in 1780. Though the one seeks his standards of taste in England and the other in France, both are conscious of the feebleness of German literature, both are striving towards a fundamental bettering of its condition, both recognize that to this end the language must first be perfected, both insist upon a study of the classics and demand careful translations, not imitations, both see the day of attainment coming, both think it still afar off, but both are laboring unrestingly in earnest towards the same goal. Frederick prophesies the time "when the German language, polished and perfected, will be taught in the schools of France and the fame of its literature be spread from one end of Europe to the other. . . . The days are not yet come, but they are nearing. I announce them to you; they will appear; I shall not see them; my age forbids me to hope it. I am like Moses. I see the promised land in the distance, but I shall not enter it." He was already across the Jordan and knew it not.

It was natural that the 'De la Littérature Allemande,' coming from the throne upon which the eyes of all Europe rested, should be everywhere read and should everywhere make deep impression. It is interesting to note its effect upon the literary generation which it in silence condemned. Schiller was but twenty-one when it appeared, and could hardly have claimed for his wild republican dramas a hearing at the court of Prussia. Of the works of Goethe, all the greatest were yet to come. Frederick died in 1786. A few days later occurred the event which we, at this distance of time, may regard as a turning point in the history of German literature, the close of the *Sturm und Drang*, the beginning of the classic period. Goethe stole forth from Carlsbad, and the Italian journey was begun. So far as dates can be given to intellectual movements, the importance of Goethe as a power in our modern life may be dated from that time. All that had found its final form at his hands before the Italian journey belongs essentially to an age with which we are no longer in sympathy. Those works which are evidence to us of Goethe's greatness were still crescent—fragmentary MSS. in his pocket, or as yet merely visions without local habitation and a name. That Frederick found little to admire in what had already appeared is, all things considered, no great wonder, for Shakspere was not yet crowned in Germany, and dramas in the Shaksperian manner were something too new and opposed to the traditional taste to find acceptance at sight. But it was natural, too, that the silently implied condemnation of the Prussian King should rouse enmity and opposition even among those who were in agreement with the main principles of his essay. The importance of the royal utterances was very generally recognized, but everywhere were murmurs of injustice, lack of patriotism, Francomania, and the like. Among the princes, even, we hear some private epistolary disapproval.

No one, however, flew into so great a rage as good old Klopstock. As self-elected literary dictator, he sat hugging the conviction that his efforts had brought the German tongue at last to perfection, while Herder, the most polished prose-writer of his time, still saw perfection afar off. From this dream of attainment Frederick's essay was for Klopstock a rude awakener. He had more than once doubted Frederick's claim to immortality, as several discontented odes bear witness, but, after the publication of this essay, he is no longer in doubt, the doors of the temple of fame shall be closed against Frederick for ever. Scarcely less angry was Hamann of Königsberg, the "wise man of the North," who, some years before, had attempted to convert the Prussian King, and supply him with clearer views in general concerning literature and its representatives. But hints of a sojourn in Spandau induced Hamann to retain his article in MS. A letter to Herder gives his wrath vent: "Such Herculean pudenda of ignorance and presumption are the real character of his (Frederick's) greatness. He treats our literature with his foreign goose-quill as the lying prophet Balaam his ass; it has already bent the knee. The miracle will not be wanting: an answer in the divine speech of the gods." A worthy answer did, indeed, come—a candid, vigorous, fair article from the pen of Justus Möser, recognizing the value of the inspiration which a life of great deeds like Frederick's must, of itself, supply to a national literature. Other answers came, too, in which, however, the uninspired bray predominated.

Far more edifying is the spirit in which the royal condemnation was received by the genius of the land, Lessing, and "the three kings" of Weimar. Lessing had completed his life work. Conscious of the influence he had exerted, and

was destined to exert, upon the literature of Germany, he must have felt keenly the cold neglect, but he utters no word. No passage in his last writings, in his letters, betrays the slightest temper. 'De la Littérature Allemande' is not mentioned by Lessing. From Wieland an official retort was expected through his literary organ, *Der Mercur*, but he makes no sign. A brief review of the essay appeared, in a mild, kindly tone, the dignified irony being scarcely noticeable. This review has been by some ascribed to Wieland, by others to Herder. Herder's irritable nature must have been tempted to a wrathful reply; in private he no doubt expressed himself vigorously, as was his wont. During fourteen years he had been in some sort the representative of German linguistic and literary criticism, and from his pen the offended youth of the land now hoped for a crushing response. Prince August of Gotha begs him to remain silent; a letter of Herder's on this subject has been lost, and thus it is that not even in the correspondence, much less in the published works, is there a reference to Frederick which does not speak high-minded admiration and appreciation of his greatness, in dignified, even enthusiastic praise.

Frederick had passed over all in silence, and the great men answer in silence—all but one; one man had been singled out whose work was to serve as a terrible example of "dégoûtantes platitudes" applauded by the parterre. For nearly ten years this man had enjoyed an unexampled fame, almost European. On terms of intimate friendship with the Duke of Weimar, and sitting in his councils, an enthusiastic admirer of the victorious Fritz, and accustomed himself to literary triumph, he must have found this royal sentence "wunderlich" indeed. Goethe was not yet old enough to be able to pass over such condemnation in absolute silence; he had not yet fought his way through to that Olympian repose of soul which characterizes his later years. He hastened at once to prepare an answer. Passages in his diaries and in the correspondence of the time show what he has in hand; that he is heart and soul in the work, that it progresses, and "despite the devil" will be finished. We find him one afternoon at the ducal residence in the room of one of the gay little ladies of the court, with a bottle of champagne by his side, working at his "Litteratur," as he terms it. Other sources show the article to have been in the form of a dialogue: in some inn of a commercial Rhineland city a Frenchman and a German discuss things literary over their wine. The article was completed and went the round of Goethe's friends; we can trace it from hand to hand, but, strangely enough, it has never come to light. The Goethe archives have disappointed expectation. Prof. Suphan still hopes that chance will serve us the same good turn as in the discovery of the old Faust MS. one year ago. The article was never printed, nor does it seem ever to have been Goethe's intention to have it printed; nowhere among his friends a hint that its publication was expected. A few months later a letter from Goethe contains these words: "I have resolved to preserve a conscientious silence about all that concerns myself and my writings;" and in the same letter occurs a passage which has already something of that supreme objectivity and clearness of vision which characterizes the last half of Goethe's life: "That the King should speak unfavorably of my piece does not strike me as at all strange. A great and powerful prince, ruling with an iron sceptre over thousands, cannot but find the work of an undisciplined boy intolerable."

But the relation of Frederick the Great to German literature was of a far more intimate nature than his writings or his direct efforts in its behalf would indicate. Patronage and direct encouragement was not Frederick's affair. It was Voltaire who enjoyed the hospitality of the Prussian court, and what of German literary talent gathered there was obliged to lay aside native barbarism and become French. But Frederick's influence was more effective and far-reaching than patronage and protection: it lay in the inspiration furnished by a great personality at the head of affairs. The sound of vigorous martial preparation in Berlin, armaments and marching troops, was the signal that the new period had come. Rossbach was won, the French power checked, Europe astonished, every pulse was quickened. Through seven years the career of the hero was watched with increasing wonder, enthusiasm, and hope. Of a sudden the man was there who gave energy to a century that had slept. The time had "contents" all at once; the spirit was roused, the imagination kindled, the national consciousness deepened. Every period of great literary production has been one of thrilling activity, in which the strength, greatness, and heroism of the people have found expression. This element of inspiration, national pride, and consciousness of power was furnished Germany by the *life* of Frederick the Great. "He gave German poetry life and substance (*Lebensinhalt*)," says Goethe in his Autobiography. Such a gift from the warrior King, the friend of Voltaire, and the slave of French taste, was, after all, an ample offset to the silent disdain of the 'Littérature Allemande;' and the full recognition of this was Goethe's noblest revenge.

Correspondence.

PROTECTION AMONG THE FRUIT-GROWERS.

To the Editor of The Nation:

Sir: At the State Convention of Fruit-Growers held at this place last week, there was a discussion upon the tariff question which was not without interest. It might be supposed, in such a congregation of representatives of protected interests, that the protectionists had the argument all their own way, but such was by no means the case.

The subject was opened by the President's suggesting that it would be well to take the sense of the Convention in regard to the advisability of sending a petition to Congress asking that the present duties on fruits, nuts, etc., be retained—they being threatened by the Mills bill now before Congress. The first speaker was a grower of English walnuts. He entirely disapproved of any discussion upon the tariff in that place. They had met, he said, to speak of the growth and care of trees and fruits, and any discussion of political matters was out of place. It was impossible, he thought, to take up part of the tariff and discuss it intelligently and not speak of the tariff as a whole. It was not possible for them to separate the question of duties on fruits and nuts from the question of duties on things they did not produce, but which they were forced to buy. They must remember that they were not merely sellers of fruit, but that they were also growers of fruit, using ploughs, harrows, harness, horseshoes, etc.; packers of fruit using boxes, paper-pulp, sugar, and tin; heads of families using hardware, lumber, and clothing; and that it was impossible for them to separate their interests in any one of these capacities from their interests in all the rest. As it was obviously impossible to take up the whole question, he was in favor of passing it over entirely.

A burly grower of French prunes and oranges then took the floor. It was evident that he cared little for logical argument, but he wanted "protection," and he was not afraid to ask for it. In the course of his remarks he said the orange-grower already had something which protected him from an overstocked market and low prices, namely, the "scale-bug." But what protection has the prunes? he asked. There was no scale or any other disease, so far as he knew, to trouble it; therefore it should be "protected."

Another speaker, Mr. Abbot Kinney of Los Angeles, expressed much pleasure at the happy comparison of a protective tariff to the "scale-bug"—an ineradicable pest and blight wherever it appeared. The State of California, he went on to say, was extraordinarily well adapted to the growth of many kinds of fruits, both on account of the intelligence of her people and the peculiarities of her soil and climate; and he for his part, claiming to be a free-born and intelligent American citizen, should be ashamed to admit that he could not compete with the ignorant "foreign paupers" whose mode of culture was antiquated and ill-managed. But if he should find that he could not do so, he would certainly not beg his countrymen to support him in an unprofitable business. He then referred to the statement which had been made by another member, that there are now planted in this State over seven million French prune trees which will come into bearing within the next three and four years, while at the present rate of consumption the product of 2,000,000 trees is more than enough to supply the home market; and he asked the prune-growers what they proposed to do with the surplus, and if they did not think it time for them to be considering not only the domestic demand, but by what means they could best compete in the markets of the world.

The depletion of our forests was then spoken of, and the consequent drying up of our water supply, for the benefit of a few complainers in San Francisco who control the lumber business of the coast, and charge us $30 per M. for undressed lumber, which in the absence of the tariff could be brought from British Columbia for perhaps half that price. Mr. Kinney asked the fruit-growers of California how they could have the face to ask Congress to retain the beggarly duties now levied on foreign fruits, pleading that if the duties are abolished their industry will be ruined, when they are, at the same time, continually telling their Eastern friends and visitors stories of net profits of from $600 to $1,000 per acre.

Another member presented the "infant-industry" argument in a moderate and becoming manner, after which the resolution favoring the petition was easily carried. A resolution was then offered asking a reduction of duty on agricultural tools, lumber, paper-pulp, bagging, nails, etc.; but this was defeated—a proof certainly either of the fruit-growers' modesty or of their love of consistency.—Yours truly,

Frank M. Gallaher.

Santa Barbara, Cal., April 21, 1888.

THE SOUTH AND THE NEGRO.

To the Editor of The Nation:

Sir: I think "Ex-Rebel," who writes from Virginia (in your issue of April 26), takes an unnecessarily gloomy view of the supposed preoccupation of the South with the negro. With such a large number of this race in our midst, constituting so large a percentage of

our voting strength, it is obviously necessary that their attitude on questions municipal and national should claim our best attention. So long as they remain in tutelage to the deputies of the Republican party, who batten on their political bondage; so long as they remain, practically, a political unit on all questions, so long must we regard the retention of political power in the hands of those who pay the stake as a question of paramount importance. We hold the blessings of a quiet and orderly government by a tenure which demands solidarity as a *sine qua non*, and we believe these matters would not be indifferent to the good people of New York if the Mikes, Barneys, *et id genus omne*, were always found on the same side without regard to the issue.

This condition of things cannot continue for ever. We have made some advance, and shall yet make more. The Eternal City was not built in a day. When we shall have removed the débris that attends all upheavals, and fixed our foundation by those principles which form the a b c of politics and insure the stability of States and nations, we shall be found taking a most lively and vigorous interest in the questions which an "Ex-Rebel" charges us with ignoring. Even now I find no lack of interest in the minds of our people upon Tariff Reform, Civil Service, and Internal Revenue, though we may be deficient in organizations for promoting the discussion of these questions among our people. There are some of us who take sufficient interest in them to become members of, and pay the assessments of, the Civil-Service-Reform Association and Tariff-Reform Club of New York, specially charged with the propagandism of these issues.

"Ex-Rebel" indicates a unique plan for the regeneration of the South and the revival of her interest in "practical politics." Forsooth, a Republican for our next President! Our experience, in this vicinity, with Republican appointees does not lead us to hope for the "survival of the fittest," and I am sure "Ex-Rebel's" panacea would make more solid, if possible, the solidarity which he now deplores. In my opinion, no more fatal blow could be dealt the South than the election of a Republican President, fashioned upon the model of a Blaine or a Sherman. If we are to divide in the South on the practical questions which "Ex-Rebel" commends to our attention, the disintegration of the black vote must be the first step, and this can only be had by continued Democratic success for some years, with honest and quiet government. "Ex-Rebel" informs us that "the negro does not strike for 'higher wages' or fewer hours," "that he is a stranger to the faith and follies of the Anarchists." If "Ex-Rebel" lives in Virginia, he knows the negro to be imitative to a degree of excess. He, apparently, does not know that they form a most respectable contingent in the order of Knights of Labor, and have engaged in strikes (within the past two years) of such magnitude as to require the presence of the First Virginia Regiment for three days to preserve the peace.

XX-Rebel.

Richmond, Va., May 1, 1888.

DEMOCRACY.

To the Editor of The Nation:

Sir: I read, of course with great interest, Mr. Lowell's address to the Independents, and accepted meekly my share of the castigation. But when the English papers declare it to be a condemnation of democracy, then I want to take up the glove. The main charge is, that we have only inferior men in public life; that with a plenty of the "raw material of statesmanship," we do not make use of it, but allow ourselves to fall under the dominion of "rings and bosses." The *Spectator* assumes that the people have control of the matter, and are responsible for this state of things if they permit it to continue; and ingeniously, and rather comically, accounts for it by the localization of our affairs, making, as it were, a number of water-tight and intellect-proof compartments which prevent the circulation of great minds.

It is the major premise which I strongly deny. The people do *not* have control of the matter. We live under an elaborate network of organization so arranged as to prevent the people from seeing or judging their public men, or exercising any effective choice as to who they shall be. From Congress down through the States to the smallest cities, the country is governed by committees made up of local members, constantly dissolving and reforming, working secretly, by majority and minority, with all individuality carefully suppressed. We choose presidents, governors, and mayors, put them in positions of great nominal responsibility, then tie their hands and deprive them of all power, and then wonder that we do not get great men—which is about as reasonable as it would be to plant potatoes and then complain of not getting corn. We give all power into the hands of legislatures, the embodiment of anarchy, where it is very easy to lose reputation but impossible to gain it, and then wonder that they are filled with men either ignorant of or insensible to these conditions.

"Bosses" and "rings" are the revolt of nature against an unnatural system, just as a man who overeats, or drinks to excess, will suffer from headache or indigestion. The people want men and leaders, but decorous respectability will allow nothing but conventions and committees and platforms, while the "bosses" recognize the want, offer themselves, and organize and discipline their followers. Irons and Powderly and Arthur can control large bodies of men, can throw large sections of the country into confusion, and their names are in every man's mouth, while the President of the United States cannot take a step towards the reform of the finances, and it is doubtful whether one per cent. of the population could tell the names of the members of his Cabinet.

It may be said that, after all, the people are the final authority, and therefore to blame. In fact, the intelligence and culture of the country are to blame. From Mr. Lowell down, the best minds, instead of inquiring *why* things are wrong, content themselves with demonstrating that they are wrong and ought not to be so. If one-half the energy and work which are spent in discussing the *theory* of the tariff could be devoted to getting the tariff out of the hands of irresponsible committees, governed by private interests and worked by the lobby, and putting it into the hands of a responsible national authority whom the people could see, there would be no trouble about the popular response.

G. B.

Boston, May 5, 1888.

THE SURPLUS AMONG THE MACARIANS.

To the Editor of The Nation:

Sir: It is interesting to note that the Macarians, as described by Sir Thomas More in his 'Utopia,' provided against the possibility of a surplus. The passage referred to is this:

"To these things I would add, that law among the Macarians, a people that lie not far from Utopia, by which their king, on the day on which he begins his reign, is tied by an oath confirmed by solemn sacrifices never to have at once above £1,000 of gold in his treasures, or so much silver as is equal to that in value [they had evidently a gold standard]. This law, they tell us, was made by an excellent king who had more regard to the riches of his country than to his own wealth; and, therefore, provided against the heaping up of so much treasure as might impoverish the people. He thought that moderate sum might be sufficient for any accident, if either the king had occasion for it against rebels, or the kingdom against the invasion of the enemy; but that it was not enough to encourage a prince to invade other men's rights, a circumstance that was the chief cause of his making the law. *He also thought that it was a good provision for that free circulation of money so necessary for the course of commerce and exchange.*" (More's 'Utopia,' Book I, page 83, Morley's Library.)

H. R.

Kansas City, Mo., April 30, 1888.

HAGGARD AND PIERS PLOWMAN.

To the Editor of The Nation:

Sir: No reader of 'She' can forget the Amahagger's unpleasant custom of putting pots on the heads of strangers. Whether this was a mere invention of Mr. Haggard's, or whether he had met with the practice elsewhere, I know not; but something of the same sort seems to have been at one time charged upon the friars. In 'Pierce the Ploughman's Crede,' written about the close of the fourteenth century, Pierce says that whereas our Lord had blessed those that weep, there are

"—— fewe of tho [these] freres for [before] thei ben ner dede
And put all in pur clath [cloth] with pottes on her [their] hedes,
Thanne he waryeth and wepeth [then they curse and weep]."

And again, if the brother proved unserviceable as a beggar—

"But [unless] he maie beggen his bred, his bed is ygreithed [made ready];
Under a pot he schal be put in a pryvie chambre,
That he schal lyven ne last but litell while after."

If the popular hatred of the friars gave credence to a report that they took this method of disposing of a superannuated or unprofitable brother, it is singular that (so far as I can discover) it occurs nowhere else in the immense mass of satire and vituperation of the friars which the Wyclifite movement produced.

The Rev. W. W. Skeat, the editor of the 'Crede,' was so struck with the strangeness of this pot business that he tried, through *Notes and Queries*, to find out if anybody else had heard or read of such a thing; but without success.

Wm. Hand Browne.

Notes.

D. Appleton & Co. have in press 'The Advance-Guard of Western Civilization,' by James R. Gilmore; 'The "Books that Have Helped Me" Papers,' reprinted from the *Forum;* 'Ignorant Essays,' by Richard Dowling; 'Letters from a Débutante in New York Society'; 'The Development of the Intellect—The Mind of the Child'; 'Outlines of Pedagogics,' by Col. F. W. Parker; 'Electricity,' by Prof. Sylvanus Thompson; 'Diamagnetism and Magnecrystallic Action,' by Prof. Tyndall; and the following novels: 'A Nymph of the West,' by Howard Seely; 'A Counsel of Perfection,' by Lucas Malet; 'Eve,' by S. Baring-Gould; and 'The Little Maid of Acadie,' by Marian C. L. Reeves.

Ticknor & Co., Boston, publish this week 'Homestead Highways,' by Herbert M. Sylvester; 'Sketches Abroad,' by J. A. Schweinfurth, with architectural illustrations—a limited edition; 'A Dictionary of Lowland Scotch,' by Charles Mackay; and 'The Pilgrim Republic,' by John A. Goodwin.

Ginn & Heath announce in their "Classics for Children" an adaptation of Franklin's Autobiography, and 'Selections from Ruskin.'

A quarto volume, consisting of twelve poems of 'American Bird Legends,' each illustrated by a chromolithographic reproduction of a water-color bird drawing—the poems by Harry J. Shellman, the illustrations by A. Sidney Higgins—will be published by the latter at 1227 Fulton Street, Brooklyn, N. Y.

Application should be made to Mr. G. May (Whittaker & Co.), 2 White Hart Street, Paternoster Square, London, E. C., for copies of a limited edition of 'Slang, Jargon, and Cant: a Dictionary of Unconventional Phraseology,' compiled and edited by Albert Barrère and Charles G. Leland.

B. Westermann & Co. will have for sale here immediately after its appearance abroad 'Aus dem Leben Kaiser Wilhelms, 1849-1873,' the late Emperor's personal memoirs compiled by his daily companion, Hofrath Schneider, and revised and approved by himself, and laid away for many years. The work will be in three volumes.

M. Octave Feuillet's new romance, 'Un Artiste,' destined for the *Revue des Deux Mondes* during the present year, will be translated into English by Mr. Henry Hager, from advance sheets.

The firm of George R. Lockwood & Son has been dissolved, and reconstituted as Lockwood & Coombes.

Mr. John Treat Irving's 'Indian Sketches' (G. P. Putnam's Sons) is the record of a visit made in 1833 to various tribes beyond our then Western frontier—notably the Otoes and the four tribes of the Pawnees. Mr. Irving made the journey in the company of commissioners sent in behalf of the United States to purchase lands and conclude treaties. He had good opportunities of observation, and he used them well. His book is a vivid and truthful account of what he saw, and, being made up from notes written at the time, or immediately after, it has all the freshness of a narrative of recent personal experience, joined with the permanent interest and value which belong to a faithful reflection of phases of life that have passed away for ever.

Two new volumes have been added to the aids for the study of Shakspere texts. The Variant edition of the "Midsummer Night's Dream" (Houghton, Mifflin & Co.) is a facsimile reprint of the folio, with the variations in spelling and punctuation in the two quartos of 1600 from the copies in the Barton collection, and with the emendations which the Cambridge, Globe, Clarendon Press, Delius, Rolfe, Hudson, and White editions agree in adopting. As the Barton quartos are more perfect than those followed by the photographic facsimiles, it is an advantage to have this record of them; and altogether the volume offers as nearly complete facilities for the text of this play as could be had without an entire Shakspere library at hand. The introduction is precise and sufficient, and the editor, Henry Johnson, has done his work with fidelity and thoroughness. The first volume of the 'Bankside Shakespeare' (Brentano, agent for the Shakespearean Society of New York) contains the folio and 1602 quarto texts of "The Merry Wives of Windsor," printed side by side on opposite pages. These texts are carefully given. The introduction is by Appleton Morgan. He holds the view that the quarto is a first sketch, and that the folio represents the growth of the play in the actor's hands, and not by Shakspere. The contest in regard to this play has been a much-divided one, and the points it affords for speculation are such as commentators delight in. Mr. Morgan, who takes the most unfavorable view of Shakspere's character, writes in his characteristic amateurish way. His position seems to us untenable, but the argument he makes does not call for discussion. The edition itself is very beautifully printed, but the assistance it affords to scholars is nothing more than the convenience of parallel text.

In a little volume entitled 'A Manual of German Prefixes and Suffixes,' published by Henry Holt & Co., Prof. J. S. Blackwell of the University of Missouri endeavors to furnish "practical aid to students who may wish to gain a nearer sense than even the best dictionaries give of the meaning of German words." The manual discusses the various prefixes and suffixes in alphabetical order, giving an account of their original and derived meanings (without, however, going into etymology), and expounding their synonymic distinctions by means of illustrative examples. Particular attention is given to the synonymy of verbs compounded with prefixes that have similar meanings. The information here offered is not found elsewhere in English, and we should think, therefore, that the manual would prove very serviceable to students who have not yet learned to read German with ease, or who have not at command the resources from which Prof. Blackwell has himself drawn. And this leads us to suggest that the author might very properly have acknowledged somewhat more fully and unequivocally than he has done, the extent of his indebtedness to the labors of other men. He tells us in his preface, to be sure, that he has "borrowed help" from various sources, a list of which is given. Further on, in another connection, we are told that "the larger number of examples given is from classic German sources." But this hardly prepares us adequately for what we find when we open the book, namely, that page after page of matter—statements, qualifications, quotations, and all—is simply translated, with more or less of rearrangement, from Sanders's 'Wörterbuch der deutschen Synonymen.'

'On Deck, or Advice to a Young Corinthian Yachtsman,' by T. Robinson Warren (G. W. Dillingham), talks in an easy-going way of the lamented decline of American shipping, and about the part the yachtsman may some time play in the history of this country's marine. There are a few hints as to the kind of vessel to be selected for pleasure-sailing, and some rudiments of navigation are set forth. To be a Corinthian, a yachtsman must be skipper of his own craft. To a new hand at the sport, advice and instruction in navigation are practically useless, since his sea-going must be confined to mere coasting. Matter much more pertinent to the purpose of this book, therefore, might be substituted for the chapter on navigation. The pleasing rambling anecdotes which are scattered through the book make it capable of interesting both landsman and seaman.

The 'Messages of President Buchanan' is the title of a handsome volume compiled and published by Mr. J. Buchanan Henry (New York, 46 Exchange Place), who has rightly thought the collection would be useful and convenient for reference. It includes all but the perfunctory messages accompanying bills, etc. The work has a pious intent, for an appendix is devoted to letters exculpatory of the last President of "the Union as it is" from his Secretary of War, Joseph Holt (against Mr. Blaine's portraiture of Buchanan in his 'Twenty Years of Congress'), his Attorney-General, J. S. Black, his Postmaster-General, Horatio King, Mr. Geo. Ticknor Curtis, etc.

The widow of the historian John Richard Green has reëdited, on lines indicated by him before his death, his 'Short History of the English People,' and it has been published in a single volume by Harper & Brothers. The changes have been chiefly corrections of mistakes in detail. The plates, apparently made in England, follow the style of typography of the first edition of 1874, with a slightly larger page and smaller letter. The maps (of American make) have been correspondingly altered. The index, too, has been overhauled, but we think not improved. For example, the handy rubric of Battles has been abandoned.

Dodd, Mead & Co. have begun to bring out a Library Edition of the joint works of Walter Besant and James Rice—the first two volumes being 'The Golden Butterfly' (with an etched portrait of Mr. Besant), and 'My Little Girl. Though not in the fore-front of book-making, these have a very presentable appearance.

There is greater contrast between outside and inside in the popular edition of George Meredith's novels, *e. g.*, to name the latest, 'Sandro Belloni' (first called 'Emilia in England'), in the issue of Roberts Bros. The print has a much cheaper look than the cover.

The first number of "Macmillan's Summer Reading Library" is Mr. Marion Crawford's 'Marzio's Crucifix.' The print is open and attractive.

The unauthorized appropriation of Geikie's 'Holy Land' is a showy monument of the piratical era in which we live, pending the passage of the Chace Copyright Bill. The American publisher (John B. Alden) has not atoned for his offence by inserting illustrations, in turn lifted, as he acknowledges, from Ebers's 'Palestine.'

We conclude our list of new editions and reprints with mention of Cary's 'Dialogues of Plato,' started on its rounds afresh in the olive-green company of "Bohn's Select Library" (New York: Scribner & Welford).

The second 'Annual American Catalogue' for 1887 (New York: *Publishers' Weekly*) is again a curiosity in book-making. Whereas the former volume was a "process" reproduction from a scrapbook arrangement of titles, the present one has been composed of electrotype titles made from week to week, and finally rearranged in alphabetical order. The impression is certainly better, but the economy of the change is not manifest. So, the index has been amassed in standing type, but the alphabetizing and editing of this proved costly. The main thing, however, is to have the Catalogue go on, and to have it so well done as it is, and Mr. Bowker deserves thanks for his courage and perseverance.

In mentioning the forthcoming translation of P. Mantegazza's 'Testa,' we should have stated that this work has been done by the *pupils* of Prof. L. D. Ventura, with only his supervision.

'L'Œuvre de A. Thiers' (Paris: Jouvet & Cie.; Boston: Schoenhof) is the latest of the excellent educational collections of extracts from the works of various French authors which M. G. Robertet has prepared for the use of candidates for the higher examinations. The 650 pages of the present volume are made up in great part of carefully selected passages from the 'Histoire de la Révolution française' and the 'Histoire du Consulat et de l'Empire.' These, together with the very concise *résumé historique* with which M. Robertet has connected them, give a general view of these two important historical works, and at the same time present most of the striking events and characteristics of the period at sufficient length to do justice to the historian. In these days

when histories multiply beyond the reading powers of the general public, such a condensation as M. Robertet here gives of Thiers's two great works will be very welcome. A few extracts from some of his other writings are added, most of them taken from the fifteen volumes of his 'Discours parlementaires.' Of special interest among these is the one pronounced in the Chamber of Deputies, July 15, 1870, in opposition to the impending declaration of war against Prussia.

The success of the works of the late Russian poet, S. J. Nadson, has been remarkable. Four editions were sold within a year and a half, and the public were still insatiable. Two more editions have appeared since. One of these, published six months after his death, contains a mass of new material greater than all that was published during his lifetime. Nadson began to write in 1878, and the poems, newly given to the world, go back to 1879, when the writer was seventeen years old. His rapidly won reputation and the approval of competent judges did not turn the youthful poet's head; and his strictness towards himself, and his dislike to take the public too much into the intimacy of his personal feelings, led him to keep more than half of what he wrote unpublished. The really weak poems among those recently published are very few, and do not detract from his success, which is particularly remarkable in Russia.

Those who have followed with interest the discussion of the certificate system in these columns, should turn to the Syracuse *Academy* for May, in which Mr. Bacon retorts upon the higher institutions of learning their condescension to the imperfections of the secondary schools. His remarks are, on the whole, distinctly unfavorable to the use of certificates. The colleges, he says, "stretch down a tender welcoming hand even into the lower grades of our courses, and kindly remove those who are working in confessedly the weakest part of our educational system." If these non-certificated pupils gain admission, then their friends censure the refusal of a certificate. If they break down after acceptance, the principal is censured as if he had recommended them.

Westermann & Co. send us the first instalment of the new edition of Stieler's Hand-Atlas. Austria-Hungary, one sheet of Italy, and one of South America compose the number. The authority of this publication being well established, we need only remind our readers that there are to be thirty parts in all (eighty-nine sheets), and that an alphabetical index is promised, for the first time.

That praiseworthy organization, the Appalachian Mountain Club, whose headquarters are in Boston, is desirous to build a refuge-hut at Madison Spring, in the saddle between Mt. Adams and Mt. Madison, of the White Mountain range. This should be of stone, and equipped with sleeping-bunks, a stove, and the most necessary furniture, including cooking utensils and an axe. It will not only be a place of comfort and safety for tourists, but will afford a base to photographers, scientists, etc. As it will cost from $500 to $750, the Club asks assistance from any source. Subscriptions may be sent to Mr. Frederic D. Allen, 10 Humboldt Street, Cambridge, Mass.

—The first number of the *Journal of American Folk-Lore* (Boston: Houghton, Mifflin & Co.; London: Trübner) presents a handsome and substantial appearance. All the editors furnish articles. Mr. W. W. Newell argues plausibly that the Voudoo of Hayti and Louisiana is not an African superstition, but was introduced by the French, and grew out of the ecclesiastical slander and popular misconception of the heretical Waldenses. Dr. Franz Boas treats of certain songs and dances of the Kwakiutl of British Columbia. Prof. T. F. Crane discusses the diffusion of popular tales. The Rev. J. Owen Dorsey has several articles on Indian song and myth and story. Outside of the regular staff, Prof. H. Carrington Bolton gives a sample of his extensive researches concerning the "counting-out rhymes" of children; Dr. D. G. Brinton narrates some Lenâpé conversations; and W. M. Beauchamp furnishes some Onondaga Tales. On the whole, the aborigines receive more attention than the negro. After the regular papers come interesting departments called the "Waste-Basket of Words," "Notes and Queries," and "Folk-Lore Scrapbook." Book reviews and bibliographical notices of periodicals round out the scheme of this quarterly, to which we wish all success.

—The May *Century* opens with a personal explanation, in which Mr. Kennan tells how it came about that the Russian Government allowed him such latitude of investigation in Siberia. The fact that he had already come to conclusions favorable to the Government, and expected to fortify them by this journey, makes his final opinion all the more noteworthy. In this month's paper he writes only a very excellent travel sketch of his ride across the Caucasus. Mr. Arnold's few words upon Milton will be read with the more interest because such criticism from him is at an end. It is too brief an article, and as Milton does not often have the fortune to be worthily spoken of, it is a most welcome assertion of his claim to the highest poetic honor; and, as is usual with Arnold, the statement has light in it as well as force. There are several other notable articles, and Mr. Aldrich furnishes the poetry—four characteristic bits of verse; but the most interesting contribution is a statistical paper upon "The Chances of Being Hit in Battle," by Col. William F. Fox, in which tabulated views are given of the greatest percentage of loss in regiments in the whole war, and also in several separate battles. The returns are so much more complete for the Northern than for the Southern side that the figures are largely confined to the former. It appears that the average loss from killed and mortally wounded was 5 per cent. for the whole army—a higher rate than in the Crimean or Franco-Prussian war. The greatest loss by regiments did not exceed 20 per cent., but several lost more than 10 per cent. In single engagements the proportion of loss to the fighting strength was very heavy, as high as 76 per cent. in one case, and here, too, it is pointed out that the loss of the Light Brigade at Balaklava was only 36.7 per cent., and the heaviest loss in the Franco-Prussian war in any regiment on one field was 49 per cent., while our regimental losses in both armies frequently rose to 60 per cent. in a single battle. The author states that the regiments which lost most by battle suffered least from disease, and he is inclined to ascribe this fact to the moral courage and endurance of the soldiers, who were as brave in camp as against the enemy. The article is full of curious facts and comparisons, and the field is one which has been little worked.

—While Northern people have generally reached the conclusion that the scheme of Federal aid to common schools in the South is wrong, because such aid is not needed, there still remains, and will long continue, occasion for assistance from the North to higher institutions of learning at the South, as there has always been for such help from the East to struggling institutions in the West. One of the most deserving appeals of this sort ever presented is now made by the Atlanta (Ga.) University, which was organized by the American Missionary Association, for the education of the blacks, shortly after the war, and is now in its nineteenth year of successful work. Like the Hampton (Va.) Institute, the Atlanta University places a high value upon industrial training, and its graduates are carrying its good influences through Georgia and the surrounding States. The institution is in special need of outside assistance this year, because it has lost the annual State appropriation of $8,000, through the very proper refusal of the management to accept the money on the new terms fixed by the last Legislature, which would require them to cease teaching their own children and to promise not to teach any other white children with the blacks in future. The University needs $16,000 for this year's current expenses, and it appeals also for an endowment of at least $250,000, which would place it for the first time on a sound and permanent foundation. Prof. Horace Bumstead is now at the North engaged in efforts to raise the money, and funds may be remitted to him in care of Mr. Morris K. Jesup, 52 William Street, New York city. It would be hard to find in the whole country a place where the benevolently disposed can invest funds to such great and lasting advantage.

—All who are interested in the Selden Society, founded in England last year "to encourage the study and advance the knowledge of the history of English law," will be glad to know that the first volume of its publications, issued in respect of the subscription for 1887, has appeared. This volume will soon reach the subscribers through the Smithsonian Institution. We shall recur to it again. At present it is enough to say that it makes a very handsome quarto volume, and that it contains a selection from the earliest Pleas of the Crown, hitherto unpublished. These begin with the year 1201 and end with 1225. The Latin of the rolls is here accompanied by an excellent English translation and by notes, a valuable explanatory introduction, and indices of subjects, persons, and places. In the midst of the period which these cases illustrate, "the great Charter was granted and the ordeal was abolished; the years which follow are critical years in the history of trial by jury." The editor, Mr. Maitland, whose excellent work upon 'Bracton's Note-Book' was lately reviewed in our columns, is already employed upon the second volume, to be issued to subscribers for the year 1888. This will contain selections from the earliest Manorial Rolls extant, accompanied by a translation. These are an extremely interesting class of rolls: "The whole legal life and much of the social life of a mediæval village is recorded in one way or another upon the manor rolls." The Society is anxious to add to its list of subscribers, for upon this depends its power of work. It appeals especially to lawyers, as those who should be interested in promoting the thorough study of their own learning and in securing the publication of these most important documents; but the volumes of the Society will prove interesting to general students, especially historical students, and subscriptions are invited from all. The annual subscription ($5.18) may be sent to Professor J. B. Thayer, Cambridge, Mass., through whom the circulars of the Society can be obtained.

—At a recent meeting of the Archæological Society of Berlin, Dr. Treu reported the results of investigations which he has been making with regard to the arrangement of the figures

in the western pediment of the Zeus temple at Olympia. If the conclusions at which he has arrived are borne out by the facts, the hitherto accepted arrangement of these figures will be almost entirely upset. Starting from the Centaur biting the Lapith in the left half of the pediment, pieces recently proved to belong to this group show that the Centaur has the mastery over the Lapith, who is trying to strangle him, and that the relative height of the two heads as restored is wrong, the Centaur's being really higher than the other. This leads to an exchange of places between this group and the corresponding one in the other half of the pediment, of a Centaur seizing a boy; and such an exchange is justified still further by the fact that a cutting in the plinth of the "biting Centaur" exactly fits the figure next which it stands in the new arrangement. Moreover, Dr. Treu believes that the groups on either side of the Apollo should exchange places, so that the two figures known as "Theseus" and "Peirithoös," who are swinging axes, should occupy positions next Apollo, their action directed away from the centre instead of towards it. While it is true that the height of these two figures would naturally entitle them to these places, it is difficult to imagine the effect of the Apollo in such an arrangement, inasmuch as his action, which is now so impressive in its simplicity, would be considerably weakened were there a partisan at his side directing a heavy blow at the same antagonist. But the account of the report which we have received in the *Philologische Wochenschrift*, is so meagre that it would not be wise to pass judgment upon it, and we await with interest the publication of Dr. Treu's essay. This much ought to be added, however, that both Curtius and Furtwängler, than whom there have been no more careful and thorough students of these sculptures, are reported as accepting Treu's rearrangement.
